Moving Forward

In January 2001, the 103-mile Adopted Washington Regional Metrorail System was completed, successfully fulfilling a vision for a world-class transit system that was conceived almost 50 years ago. To meet the needs of continued, robust growth beyond the service area of the Metrorail system, new investment in regional transportation improvements is needed where existing and planned facilities can no longer support the demands of businesses and communities. One such area is the Dulles Corridor, which lies west of the nation's capital in Northern Virginia in Fairfax and Loudoun counties. The Dulles Corridor is a vibrant, diverse mix of businesses, neighborhoods, recreational amenities and an international airport that continues to attract population and employment growth at almost twice the rate of the region.

New transit investment in the Dulles Corridor will link the region's key activity centers serving growth and development beyond the completed regional Metrorail system.

To respond to this increasing travel demand, the Federal Transit Administration (FTA), the Virginia Department of Rail and Public Transportation (DRPT), and the Washington Metropolitan Area Transit Authority (WMATA), in cooperation with the Federal Aviation Administration (FAA), are proposing a 23-mile extension of Metrorail in the Dulles Corridor. The proposed extension will enhance the overall transportation system, improving transit service, ridership, and transit travel times, while supporting the existing and future land uses and economic development. It will assist in maintaining the regional competitiveness of the corridor and in preserving the quality of the environment that makes the Dulles Corridor attractive to residents, businesses, and visitors alike. Equally important, the proposed extension will provide high-quality, high-capacity transit service between Washington Dulles International Airport and the region's core via a direct connection to the existing Metrorail system.

Washington Metrorail System

Investment in efficient and reliable transportation facilities to meet travel needs will contribute to the area's economic, social, and environmental quality.

The Final EIS is a decision tool for shaping the future of the Dulles Corridor. It describes:

- Why transportation improvements are needed;
- Why Metrorail extension has been selected to meet these needs;
- What other alternatives were considered;
- What the economic, environmental, and social impacts of the extension would be;
- How much the extension would cost: and
- Actions required to make the proposed extension a reality.

The Final EIS documents the evaluation process and findings used by decision-makers to select the appropriate transportation improvements needed to secure the future of the Dulles Corridor in light of the potential effects on the social, economic and natural environment.

Its purpose is to assist decision-makers and the public in selecting a transportation investment strategy for the Dulles Corridor and the region, consistent with federal, state and local goals and with environmental and community initiatives.

The Final EIS has been prepared in accordance with the provisions of the National Environmental Policy Act of 1969 (NEPA), as amended. FTA is the lead federal agency for the Dulles Corridor Rapid Transit Project, and the Federal Aviation Administration (FAA) is a federal cooperating agency. The Final EIS is being circulated to inform decision-makers and the public about the selection of the Metrorail extension and on the potential consequences of implementing the proposed extension in the corridor. Overall, the potential adverse impacts of the extension on the human and natural environment are expected to be minor given the complexity of the project. Coordination with the public, stakeholders, resource agencies, and local governments has confirmed these findings.

The potential adverse effects of the project are expected to be relatively low as a result of the use of existing transportation rights-of-way given the complexity and length of the project.

The proposed extension would be constructed in two phases in order to reduce annual funding needs by spreading the construction costs over a longer period of time. The first

Traffic Congestion

The central and eastern portions of the corridor currently experience some of the region's worst traffic congestion.

phase of 11.6 miles would commence from a seamless connection with the existing Orange Line near West Falls Church, serve Tysons Corner, and reach Reston at Wiehle Avenue. It is anticipated that this first phase, named the Wiehle Avenue Extension, would begin operations in 2011. The second phase of 11.5 miles would continue westward from Wiehle Avenue and serve Reston, Herndon, Dulles Airport, and eastern Loudoun County by 2015.

The extension would be funded by FTA, the Commonwealth of Virginia, Fairfax County, Loudoun County, and the Metropolitan Washington Airports Authority (MWAA), along with possible private sector funding. At this time, FTA is considering only the first phase of construction (i.e., the segment between the Orange Line near West Falls Church and Wiehle Avenue) for New Starts funding from the pending six-year reauthorization of the New Starts program. FTA may consider the subsequent phase for federal funding in the future, but has made no commitment to do so. Furthermore, FTA has determined that the first phase now being considered for funding has independent transportation utility even if the subsequent phase is never built. (The first phase serves the high employment area of Tysons Corner.) Therefore, FTA will make a decision on funding the first phase without regard to the possible future phase.

In the Final Environmental Impact Statement (EIS), the alternative formerly known as "LPA Phase 1" in the October 2003 Supplemental Draft EIS and Section 4(f) Evaluation has been renamed the Wiehle Avenue Extension and is expected to begin operations in 2011. This change reflects the federal approach to the project's funding under the FTA's New Starts program. It will assure consistency among the environmental, engineering and financial documents during the project's development.

The proposed extension would be constructed in two phases in order to reduce annual funding needs by spreading the construction costs over a longer period of time.

In the October 2003 Supplemental Draft EIS and Section 4(f) Evaluation, as well as this Final EIS, the term "full LPA" represents the Wiehle Avenue Extension and the second phase of the Dulles Corridor Rapid Transit Project. This second phase would extend west from Wiehle Avenue to Washington Dulles International Airport and Route 772 and is expected to begin operations in 2015.

The terms "LPA", "proposed action", or "selected LPA" refer to both the Wiehle Avenue Extension and the full LPA collectively.

Overview

The Final EIS is a significant milestone in advancing a solution to address the travel needs and leverage the opportunities in the Dulles Corridor, and to assist the region and corridor in realizing and maintaining its full potential. This Executive Summary provides an overview of the findings and conclusions of the Final EIS in terms of the following:

- Future Needs and Challenges
- Project Description
- The Alternatives Process
- Implementing the Project
- Coordination Opportunities
- Future Actions

The Final EIS contains more information on the topics discussed in this Executive Summary. The following table lists the topics and where further details may be found in the document.

Summary Topic	Final EIS Chapters	
Future Needs and Challenges	Chapter 1	Purpose and Need
Project Description	Chapter 2	Alternatives Considered
The Alternatives Process	Chapter 2	Alternatives Considered
	Chapter 3	Social Effects
	Chapter 4	Environmental Effects
	Chapter 5	Economic Effects
	Chapter 6	Transportation Effects
	Chapter 7	Section 4(f) Evaluation
	Chapter 9	Secondary and Cumulative Effects
Implementing the Project	Chapter 8	Financial Analysis
	Chapter 10	Evaluation of Alternatives Carried Forward
Coordination Opportunities	Chapter 11	Public Coordination and Comments
	Appendices	J,K
Future Actions	Chapter 11	Public Coordination and Comments
	Appendices	J,K

FUTURE NEEDS AND CHALLENGES

The Dulles Corridor, located in Northern Virginia west of the nation's capital, is truly the "Main Street" of one of the nation's fastest-growing business and population centers. It is home to the headquarters of leading technology firms, to Tysons Corner - one of the nation's largest employment and retail shopping centers, and to Washington Dulles International Airport. In addition, the corridor offers a diverse mix of high-intensity office development, many of the most desirable residential neighborhoods in the region, and numerous cultural and recreational resources, such as the Washington and Old Dominion Railroad Regional Park.

Key activity centers will continue to generate diverse travel needs exceeding the capacity of existing and future improvements.

Regionally significant activity centers in the corridor continue to expand and prosper. This continued growth is generating an unfulfilled demand for additional and improved transportation facilities to enhance mobility and accessibility within and through the corridor, and to provide a full range of transportation choices to meet a range of travel needs.

Tysons Corner

Key activity centers include:

Tysons Corner - The "downtown" of Fairfax County, Tysons Corner is one of the most recognizable "edge cities" in the nation, with over 30 million square feet of commercial space and the nation's eighth largest shopping center. With Tysons Corner Center and Tysons Galleria as its centerpieces, Tysons Corner has emerged as a regional shopping destination, housing more than 330 stores and attracting 1.9 million visitors annually. Tysons Corner is one of the largest suburban business districts in the country and is larger, both in geographic area (3 square miles) and employment (90,000 jobs), than many of the central business districts in major U.S. cities including Miami, San Diego, and St. Louis.

Reston

Reston - One of the premier planned communities in North America, Reston encompasses more than 7,400 acres and a population of more than 63,000 people living in a diverse mix of housing types. The area has also emerged as a center for

high-technology firms and boasts one of the highest concentrations of office development in Fairfax County (second only to Tysons Corner). The existing employment of the Reston area of approximately 44,000 jobs is expected to increase to nearly 65,000 in 2025. Reston Town Center has more than 50 shops and restaurants, a multiplex theater, an outdoor ice rink, a 514-room hotel, and almost one million square feet of office space.

Herndon

Herndon - Similar to other areas of the Dulles Corridor, Herndon has grown over the last decade, while maintaining a balance of commercial, residential, and recreational uses. Growth is projected to continue, with a build-out potential for commercial properties in excess of 30 million square feet of floor space.

Dulles Airport

Dulles Airport - Located on 11,000 acres in the western end of the corridor, Washington Dulles International Airport is one of the world's fastest growing airports, employing more than 18,800 persons. As demand for air travel increases, the region is increasingly dependent upon Dulles Airport. At full build-out, Dulles Airport is projected to handle 55 million passengers per year (150,000 per day). The Smithsonian's National Air and Space Museum opened the Steven F. Udvar-Hazy Center in 2003 and is expected to attract three million visitors annually.

Loudoun County

Eastern Loudoun County – The high-tech industry has spurred substantial growth in Loudoun County. America Online/Time Warner, MCI, and Orbital Sciences have added thousands of jobs to the eastern part of the county. The proximity of Dulles Airport has given rise to a large amount of industrial development. In addition to job growth, Loudoun County has experienced extensive population growth. From 2001 to 2003, the county led not only Northern Virginia with a population growth of 30.7 percent, but was recognized by the U.S. Census Bureau as the fastest growing county in the nation.

With the Dulles Corridor's increasing attractiveness as a place to live and work, travel in the corridor has been steadily growing over the past 15 years. This increasing travel demand has strained the capacity of the existing transportation network, causing delays and increasing travel times between activity centers within the corridor and the region. The central and eastern portions of the corridor currently experience some of the region's worst traffic congestion, constraining the economic opportunities and threatening the quality of life that make the corridor a thriving regional center.

Over the next 25 years, the Dulles Corridor will continue to outpace the region in employment and population at an anticipated growth rate significantly higher than the entire Washington metropolitan region. Population in the corridor is expected to increase by 45 percent (compared to 32 percent for the region), adding 168,000 persons. The addition of 185,000 jobs will result in a 63 percent increase in employment levels, compared to an average increase of 41 percent throughout the region. Parallel increases in travel demand throughout the corridor are projected to exceed the capacity of the already overburdened transportation system, resulting in severely congested traffic conditions on numerous routes, further degradation of air quality, and a threat to the valued quality of life in the Dulles Corridor.

According to a 2002 survey by the American Public Transportation Association, support for transit investment in the Washington metropolitan region is almost twice that of support nationwide.

Currently planned roadway improvements are only expected to maintain existing levels of service in the corridor, and will not be able to meet future demand. Due to right-of-way, financial, and air quality constraints, additional roadway expansion beyond these planned improvements cannot be accommodated in the corridor. Existing local bus service provides a partial solution to auto travel, but it is hampered by traffic on already congested roadways, particularly in the Tysons Corner area. Given these factors and a need to reduce auto emissions in the region to meet federal air quality standards,

transportation improvements, such as a high-capacity rail rapid transit line in the Dulles Corridor, have long been the focus of public and private sector studies. The Northern Virginia 2020 Transportation Plan and local comprehensive plans recognize the need for significant future investment in transit in the corridor.

The Metrorail extension was selected as the solution to address these needs and challenges for the following considerations:

- Meeting the mobility and accessibility needs of future residents, businesses, and visitors;
- Serving and supporting future land use and development patterns while leveraging economic development and redevelopment opportunities for a vibrant, sustainable future;
- Accommodating future increases in the volume of travel demand on a roadway system that is largely "built-out", and the associated constraints for existing and planned transit systems to operate on these roadways; and
- Maintaining the air quality of the Washington metropolitan region by contributing to the attainment of regional air quality goals.

PROJECT DESCRIPTION

The Dulles Corridor Rapid Transit Project, which will be constructed in two phases, would be fully integrated with the existing Metrorail system in terms of scheduling, signage, and fare collection. Selected after consideration of various alternative improvements for the corridor, the entire 23.1-mile extension is known as the Locally Preferred Alternative (LPA). The LPA includes an extension of the regional Metrorail system through Tysons Corner, along the Dulles International Airport Access Highway (DIAAH) to Dulles Airport, along the Dulles Greenway, into eastern Loudoun County.

Having the Metrorail extension in dedicated right-of-way will improve efficiency, reliability, and predictability for travelers in the corridor.

The LPA would be implemented in two phases: the Wiehle Avenue Extension and the full LPA. The Wiehle Avenue Extension would include construction of the LPA to Wiehle Avenue with express bus service along the remainder of the project corridor. The full LPA would include an extension to Dulles Airport and Route 772 in Loudoun County. A map of the extension project is provided on the following page.

Wiehle Avenue Extension

The first phase of 11.6 miles would commence from a seamless connection with the existing Orange Line near West Falls Church, serve Tysons Corner, and reach Reston at Wiehle Avenue. It is anticipated that this first phase, the Wiehle Avenue Extension, would begin operations in 2011. The alignment follows the Dulles Connector Road, Route 123, and Route 7 in Tysons Corner and the Dulles International Airport Access Highway (DIAAH). The five stations of the Wiehle Avenue Extension are Tysons East, Tysons Central 123, Tysons Central 7, Tysons West, and Wiehle Avenue.

The Wiehle Avenue Station would serve as an interim end-of-line station. West of the station and in the median of the DIAAH, interim tail tracks with a pocket track would provide the end-of-line, turn-back maneuver and storage of trains.

In its opening years, the Wiehle Avenue Extension would operate with a mix of 6- and 8-car trains at approximately 7-minute headways during the peak periods, and 4-car trains at 12-minute headways in the off-peak periods. To accommodate these operations, the Wiehle Avenue Extension would improve the existing West Falls Church Yard by adding storage tracks for forty-two cars and expansion of the maintenance building for eight more cars. Yard improvements would also include a new yard lead from the extension and construction of a sound attenuation box over the existing loop track and a portion of the new yard lead.

Dulles Corridor Rapid Transit Project Locally Preferred Alternative

Dulles Corridor Rapid Transit Project

The Wiehle Avenue Extension would include express bus service between the Wiehle Avenue Station and transit centers/stops in the western part of the corridor.

Dulles Airport

Full LPA

Completion of the 23-mile full LPA would extend Metrorail 11.5 miles westward from Wiehle Avenue Station to serve Reston, Herndon, Dulles Airport, and eastern Loudoun County by 2015. The alignment remains located in the DIAAH until entering Dulles Airport property and then follows the Dulles Greenway to the terminus at Route 772 in Loudoun County. The six additional stations of this second phase of construction are Reston Parkway, Herndon-Monroe, Route 28, Dulles Airport, Route 606, and Route 772. Metrorail operations for the full LPA would be the same as those for the Wiehle Avenue Extension.

The Herndon-Monroe park-and-ride facility would be expanded from the existing 1,750 spaces to 3,500 spaces. Park-and-ride structures would be constructed at the new stations west of Wiehle Avenue: 2,000 spaces at Route 28, 2,000 spaces at Route 606, and 3,300 spaces at Route 772. Under the full LPA, total park-and-ride capacity in the corridor, including West Falls Church, would be nearly 16,400 spaces.

A new Metrorail service and inspection (S&I) yard would be constructed on Dulles Airport property. The yard would occupy roughly 70 to 90 acres and would be designed to accommodate 250 rail vehicles but would initially be built for 184. For safety and security considerations, where the alignment traverses airport property, there would be no tunnel exits of any kind in the secure zone of the airport.

THE ALTERNATIVES PROCESS

Alternatives Previously Considered

Numerous alternatives have been evaluated for the Dulles Corridor over the last 40 years, including a range of different travel modes.

Over the last four decades, the transportation needs of the Dulles Corridor and potential improvements have been the subject of several studies conducted by public agencies and private entities. Most of these studies identified mass transit alternatives as the best transportation solution for the corridor. Numerous land use and regional transportation plans include references to specific Dulles Corridor transit alternatives, supportive land use measures, and potential funding sources.

DRPT initially identified and described alternatives for the Dulles Corridor Rapid Transit Project in the Dulles Corridor Transportation Study, completed in 1997, that served as a federal Major Investment Study (MIS). The MIS recommended a Metrorail extension and an interim expanded bus system. In a Supplement to the Dulles Corridor Transportation Study, completed in 1999, the MIS recommendations were revised for a phased implementation of transit improvements: first, the existing express bus service; then enhanced express bus service; then bus rapid transit (BRT); a Metrorail extension through Tysons Corner with BRT between Tysons Corner and Loudoun County; and finally, full Metrorail service between the Orange Line and Loudoun County. The Commonwealth Transportation Board (CTB) adopted the revisions described in the MIS Supplement and directed that the revisions be included in the Commonwealth of Virginia's State Transportation Improvement Plan (STIP).

Alternatives Considered in the Draft EIS

The alternatives advanced for detailed evaluation in the Draft EIS were those judged to best achieve the goals and objectives for the corridor, relative to the other alternatives under consideration. Alternatives were assessed in terms of how well they achieved the following objectives:

The Draft EIS evaluated a range of multi-modal transportation options, including phased implementation of both BRT and Metrorail service, as compared to a "No Build" (Baseline) condition, to provide a seamless connection to the Metrorail system.

- Enhanced transportation service;
- Increased transit ridership;
- Supported future development;
- Supported environmental quality;
- Provided cost-effective, achievable transportation solutions; and
- Served diverse populations.

The range of alternatives considered included a variety of modes, alignments, stations, S&I yard, and ancillary facilities.

The modal alternatives initially considered included bus system improvements, bus rapid transit, express bus service, light rail transit, personal rapid transit, Metrorail, and monorail.

As a result of the previous studies, project scoping, and preliminary screening during the initiation of the preparation of the Draft EIS, the alternatives retained for further, more detailed evaluation focused on BRT and Metrorail improvements, or some combination of both, along with associated maintenance facilities.

The Draft EIS used the conclusions of the 1999 Supplement to the Dulles Corridor Transportation Study (MIS) as a point of departure, which called for phased implementation of BRT and Metrorail service.

The following alternatives were considered in the June 2002 Draft EIS.

No Build Alternative - The No Build Alternative includes additional investment beyond the existing highway and transit service infrastructure and services within the corridor, and any investments that are committed to be implemented by 2025 aside from the Dulles Corridor Rapid Transit Project. This alternative serves as the basis for comparison and evaluation of the Build Alternatives described below.

Bus Rapid Transit (BRT) - BRT is transit service that uses buses operating in a limited access right-of-way to provide amenities typical of rail service, such as enhanced stations and platforms and off-vehicle fare collection. BRT would extend the full length of the Dulles Corridor from the West Falls Church Station on the Metrorail Orange Line to Route 772 in Loudoun County.

Metrorail - Metrorail is service like that currently provided by the existing 103-mile regional system, consisting of rapid transit vehicles operating on a dedicated right-of-way. Metrorail would extend the full length of the corridor from a point between the East and West Falls Church Stations on the Metrorail Orange Line to Route 772 in Loudoun County.

The Build Alternatives retained for consideration in the Draft EIS were those that best served the needs of the Dulles Corridor.

Combined BRT/Metrorail - Metrorail would extend from a point between the East Falls Church and West Falls Church stations on the Orange Line through Tysons Corner, and BRT would operate in the remainder of the corridor, from Tysons Corner to Route 772 in Loudoun County.

Phased Implementation - BRT and Metrorail improvements would be implemented beginning with BRT for the length of the corridor. Ultimately BRT would be replaced with Metrorail service, first from the existing Metrorail Orange line through Tysons

Corner, and then from Tysons Corner to Dulles Airport, terminating at Route 772 in Loudoun County.

The alternatives evaluated in the June 2002 Draft EIS generally followed the Dulles Connector Road, DIAAH, and the Dulles Greenway, with several alignment design options. Because the project is an extension of the existing Metrorail system, each proposed alternative included a direct connection to the Metrorail Orange Line. Other elements of the alternatives considered in the Draft EIS included ancillary facilities, such as a Metrorail S&I Yard and a BRT Maintenance and Storage Facility. The highway and transit infrastructure for the No Build Alternative was assumed to be completed by others and in place before the project would be implemented.

The comparative evaluation of the alternatives for the project described in the June 2002 Draft EIS focused on the relative effectiveness of each alternative in meeting the stated project goals and objectives, the essential differences among alternatives and alignment options, and the basic advantages and disadvantages of each alternative. Goals ranged from improving public transit and broadening the availability of transportation services to supporting future land use development patterns and preserving and enhancing neighborhood and environmental quality. The effectiveness of each of the alternatives in meeting these goals was assessed against a set of evaluation criteria and measures.

The goals used to measure the performance of alternatives were:

- *Increase transit ridership*
- *Support future development*
- *Provide cost-effective, achievable transportation solutions*
- *Serve diverse populations*

Key findings in the Draft EIS relative to the alternatives considered include the following:

Draft EIS No Build Alternative

- The No Build Alternative would not afford enhanced opportunities for economic development, and is not consistent with local and regional plans, which call for transit investment in the corridor.
- The No Build Alternative would have the fewest short-term environmental impacts, but the least desirable long-term effect on the environment, including transportation, social, economic and environmental factors.

The No Build Alternative, or taking no additional action, would not be consistent with adopted local and regional plans.

Draft EIS BRT Alternatives

- BRT service could be implemented before Metrorail or Combined BRT/Metrorail.
- BRT would not support land development patterns in Tysons Corner as well as Metrorail, Combined BRT/Metrorail, or Phased Implementation, and would not penetrate Tysons Corner to effectively serve its workers, shoppers, and residents.
- BRT would be less expensive to construct than choices involving Metrorail service.
- BRT would provide less overall passenger capacity than Metrorail.
- BRT would not provide the same level of accessibility for minority and low-income populations to regional job choices as Metrorail.

According to MWCOG, vehicle-miles of travel, which is a measure of how extensively roads are used, is expected to significantly increase within the corridor by 2025. Planned freeway and arterial lane-miles will not keep pace.

Draft EIS Metrorail Alternatives

- Metrorail would provide the best opportunity to capture previous investment made in regional infrastructure.
- Metrorail service would generally result in the shortest travel time, especially for reverse commute trips and those that begin and end in Tysons Corner.

- Metrorail service would deliver the highest ridership (more than twice as much as BRT) and the highest number of new trips (more than three times more than BRT), and would result in a higher percentage of people using transit.
- Metrorail would provide a seamless "single-seat" link between Dulles Airport and the region's core, and provide facilities commensurate to the status of this international airport.
- Metrorail service would provide a much greater increase in the capacity to move people through the corridor than either BRT or Combined BRT/Metrorail.
- Metrorail would have higher growth potential in station areas along the corridor due to planned increases in allowable densities at rail stations, and would better contribute to the objectives of adopted county master plans.
- More members of the business community, area neighborhood residents, and civic organizations expressed support for Metrorail than for any other choice.

The Draft EIS found that BRT would be faster to implement and less expensive to construct than Metrorail but would serve fewer people less effectively, and therefore was not selected as the Locally Preferred Alternative.

Draft EIS Combined BRT/Metrorail Alternative

- The combined service would be similar in nature to both the BRT and the Metrorail options.
- With Combined BRT/Metrorail, areas that would be served by BRT would not have to wait for rapid transit service as long as they would for Metrorail service.
- Combined BRT/Metrorail would blend the benefits of Metrorail service in areas where BRT would not adequately serve development patterns with the benefits of enhanced, more immediate transit service in other areas.
- Combined BRT/Metrorail would provide a greater increase in capacity to move people through the corridor, and would have higher ridership and improved travel times when compared to BRT service alone.

Draft EIS Phased Implementation Alternative

The Draft EIS concluded that major transit capital investment such as Metrorail in the Dulles Corridor would improve transit travel times and make them more competitive with highway travel. Peak period Metrorail times are faster than highway times in over one-half of analyzed corridor origination-destination pairs.

- Phased Implementation would cost the most, but would combine the advantages of both BRT and Metrorail service. Under Phased Implementation, transit service would be introduced in the corridor as soon as possible.
- Phased Implementation would be the most disruptive to the community, traffic, and transit service during the conversion of BRT to Metrorail because of the extended construction periods associated with each of the modes, followed by the conversion period.
- Phased Implementation would provide all the long-term benefits of Metrorail described above.

Alternatives Considered in the Supplemental Draft EIS

Based on public and agency coordination after the completion of the Draft EIS and after an LPA was selected, DRPT and WMATA identified a series of modifications to the project to resolve outstanding design issues, reduce environmental and community impacts, and allow for construction of the project in two phases. The Supplemental Draft EIS was prepared to assist decision-makers and the public in understanding the effects of the proposed modifications to the selected LPA. A comparative evaluation was presented for the following alternatives:

Supplemental Draft EIS No Build Alternative

- The No Build Alternative for the Supplemental Draft EIS was similar to the No Build Alternative defined in the Draft EIS but updated to reflect current conditions.

- The alternative included existing transportation infrastructure and services, as well as improvements included in the region's constrained long-range plan and planned to be implemented by 2025.
- The No Build Alternative provided a baseline for comparison against which the other alternatives were evaluated.

Supplemental Draft EIS Metrorail Alternative

- This alternative was the Metrorail Alternative evaluated in the Draft EIS and originally selected as the LPA (with Alignment T6 through Tysons Corner and a new S&I Yard at Site 15).
- The alternative would generally follow an alignment between the Metrorail Orange Line near West Falls Church Station and Route 772 in Loudoun County, using the median of the Dulles Connector Road, the DIAAH, and the Dulles Greenway. It would include 11 new stations and ancillary facilities, such as a new Metrorail S&I Yard, traction power substations, tie-breaker stations, and stormwater management ponds.
- The Metrorail Alternative was included in the Supplemental Draft EIS to facilitate understanding of the changes in effects associated with the proposed modifications to the LPA.

Supplemental Draft EIS Locally Preferred Alternative

The primary difference between the Supplemental Draft EIS Metrorail Alternative and the proposed LPA is that the proposed LPA would be implemented in two phases – the Wiehle Avenue Extension (originally called LPA Phase 1) and the full LPA.

The Supplemental Draft EIS addressed proposed design modifications to the selected Locally Preferred Alternative, including implementation of the project in two phases.

Supplemental Draft EIS Wiehle Avenue Extension

- For the Wiehle Avenue Extension, Metrorail would be constructed from the Metrorail Orange Line through Tysons Corner to Wiehle Avenue, with express bus service in the western portion of the corridor until rail service could be extended.
- The Wiehle Avenue Extension would be similar to the Metrorail Alternative in terms of alignment, stations, facilities, and operating characteristics but would have an interim end-of-line station at Wiehle Avenue.
- The Wiehle Avenue Extension would include improvements at the West Falls Church S&I Yard to accommodate the extension.
- Alignment plans and profiles were adjusted for a variety of purposes including reducing potential noise impacts, visual impacts, costs, and improving operational efficiency.
- Design modifications of station site plans and ancillary facilities addressed operational changes to respond to concerns of local jurisdictions and landowners.

The potential benefits and effects of the full LPA under the Supplemental Draft EIS were similar to the Metrorail Alternative from the June 2002 Draft EIS.

Supplemental Draft EIS Proposed Full LPA

- The proposed full LPA would be similar to the Metrorail Alternative in terms of alignment, stations, facilities, and operating characteristics and would continue west of Wiehle Avenue to Route 772.
- Alignment plans and profiles for the full LPA were adjusted for a variety of purposes including reducing potential effects on historic resources, noise impacts, visual impacts, costs, and improving operational efficiency.
- Design modifications of station site plans and ancillary facilities addressed operational changes to respond to concerns of local jurisdictions and landowners.

Revisions to the Locally Preferred Alternative have been approved by the Commonwealth Transportation Board and the Washington Metropolitan Area Transit Authority Board of Directors.

Evaluation of alternatives in the Supplemental Draft EIS showed that many of the benefits and potential effects of the proposed LPA were similar to those presented for the Metrorail Alternative in the Draft EIS. The proposed LPA would provide a greater degree of improvement in Dulles Corridor transit services than the No Build Alternative, and overall would provide similar support for future development in the Dulles Corridor to the Metrorail Alternative. Relative to the Metrorail Alternative, the design modifications for the LPA would result in slightly higher ridership, reduced visual impacts at the eastern end of the corridor, and an increase in impacts on water resources in the western end of the corridor. The full LPA would provide higher transportation and economic development benefits than the Wiehle Avenue Extension, and this first phase of the project would not be consistent with future land use designations or future land development patterns west of Wiehle Avenue. Although implementation of more express bus service in the western end of the corridor for the Wiehle Avenue Extension would have minimal physical effects, this service would also result in fewer transportation and development benefits than the full LPA.

Based on the analysis contained in the Supplemental Draft EIS, public comments received on the document, and agency coordination, the CTB approved the revision of the LPA in March 2004 to incorporate the elements required for phased construction and the design refinements outlined in the Supplemental Draft EIS and recommended in the Public Hearings Report. In April 2004 the WMATA Board also approved the revision of the LPA as outlined in the Supplemental Draft EIS and recommended in the Public Hearings Report.

Alternatives Considered in the Final EIS

The Final EIS includes the evaluation of the No Build Alternative and the LPA, which would be implemented in two phases.

The Final EIS was developed to respond to comments and issues raised during the circulation of the Draft EIS and the Supplemental Draft EIS and to provide more detailed information on the design of proposed mitigation measures for unavoidable impacts associated with the project. The Final EIS presents an evaluation of the following alternatives:

Final EIS No Build Alternative

- The No Build Alternative for the Final EIS is similar to the No Build Alternative defined in the Supplemental Draft EIS but updated to reflect current conditions.
- The alternative includes existing transportation infrastructure and services, as well as improvements included in the region's constrained long-range plan and planned to be implemented by 2025.
- The No Build Alternative provides a baseline for comparison against which the other alternatives were evaluated.

Final EIS Locally Preferred Alternative

The LPA for the Final EIS generally follows an alignment between the Metrorail Orange Line near the West Falls Church Station and Route 772 in Loudoun County, using the median of the Dulles Connector Road, the DIAAH, and the Dulles Greenway. The alignment diverges from these routes to serve Tysons Corner and Dulles Airport. The LPA would include 11 new stations, as well as ancillary facilities, such as a new Metrorail S&I Yard on Dulles Airport property, traction power substations, tie-breaker stations, and stormwater management ponds. The LPA would be implemented in two phases – the Wiehle Avenue Extension and the full LPA.

Final EIS Wiehle Avenue Extension

- Initially, Metrorail service would be provided from the existing Orange Line near West Falls Church through Tysons Corner to Wiehle Avenue (the Wiehle Avenue Extension). Express bus service would be provided between Wiehle Avenue and the western portion of the corridor until Metrorail is extended to Route 772.
- It is anticipated that the Wiehle Avenue Extension would begin operations in 2011.

Final EIS Full LPA

- During the second phase of construction, Metrorail service would be extended west of Wiehle Avenue to Dulles Airport and Loudoun County.
- The full LPA is expected to begin operations by 2015.

Potential positive effects include:

- *Air quality benefits*
- *Enhanced mobility*
- *Reinforcement of land use patterns*

The following table summarizes the characteristics of the alternatives evaluated in the Final EIS.

Characteristics of Alternatives Evaluated in the Final EIS

		Locally Preferred Alternative		
Characteristics	***No Build Alternative (2025)***	***Wiehle Avenue Extension Opening Year (2011)***	***Wiehle Avenue Extension (2025)***	***Full LPA (2025)***
New Metrorail Line	–	11.6 miles	11.6 miles	23.1 miles
New Metrorail Stations	–	5	5	11
Yard Facilities	–	Improvements to West Falls Church S&I Yard	Improvements to West Falls Church S&I Yard	Site Y15 and Improvements to West Falls Church S&I Yard
Ancillary Facilities	–	11 substations, 4 tie-breaker stations, 11 stormwater facilities	11 substations, 4 tie-breaker stations, 11 stormwater facilities	21 substations, 7 tie-breaker stations, 24 stormwater facilities
Metrorail Operating Characteristics	7 minute peak period service	7 minute peak period service	7 minute peak period service	7 minute peak period service
	12 minute off- peak period service	12 minute off- peak period service	12 minute off- peak period service	12 minute off- peak period service
Capacity and Reliability Improvements to Metrorail System	8-car train operations, line reconfiguration, longer headways	No improvements beyond those included in the No Build Alternative	No improvements beyond those included in the No Build Alternative	No improvements beyond those included in the No Build Alternative
Express Bus Service	Fairfax and Loudoun Counties planned transit improvements (Express Bus) in the Dulles Corridor to West Falls Church Station	More Express Bus Service provided between Wiehle Avenue and points west	More Express Bus Service provided between Wiehle Avenue and points west	No Express Bus Service provided
Highway	Existing highways and planned highway improvements through 2025 included in the 2003 update of the MWCOG constrained long-range transportation plan (CLRP)	No improvements beyond those included in CLRP	No improvements beyond those included in CLRP	No improvements beyond those included in CLRP

Characteristics	No Build Alternative (2025)	Locally Preferred Alternative		
		Wiehle Avenue Extension Opening Year (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Other Bus Service	Existing Metrobus, Fairfax Connector and Loudoun County Bus Services; marginal increases in local transit service to meet demand	Bus Service improvements provided	Bus Service improvements provided	Bus Service improvements provided

Environmental Effects of Alternatives Evaluated in the Final EIS

Adjacent communities would benefit from improved mobility and accessibility, but could experience increases in traffic volumes.

The alternatives evaluated in the Final EIS have been assessed for their potential effects on the existing social, environmental, economic, and transportation conditions in the Dulles Corridor. The social and environmental effects of the alternatives are anticipated to be minor, especially given the length and complexity of the project, because most of the Metrorail extension would occur within the medians of the Dulles Connector Road, DIAAH, and Dulles Greenway. During the preparation of the Final EIS, agency coordination continued to address potential effects of design refinements and appropriate mitigation.

In comparison to the No Build Alternative, the full LPA is expected to have positive effects on commercial and residential properties located near transit stations, and contribute to more sustainable and transit-supportive economic development by focusing higher-density residential and commercial land uses around the transit stations, as a result of the investment in the Metrorail extension.

The design of facilities will incorporate mitigation measures to offset unavoidable adverse impacts to the transportation, social, economic and environmental context.

The full LPA and its first phase, the Wiehle Avenue Extension, would result in changes to traffic conditions as people change their travel patterns to access the new transit stations, affecting some of the neighborhoods that surround certain stations. Although several neighborhoods would experience such traffic-related effects, these neighborhoods would also directly benefit from the mobility and accessibility that the transit improvements would bring. Neighborhoods surrounding the Tysons East, Tysons West, Wiehle Avenue, Reston Parkway, and Herndon-Monroe stations would be most affected.

Secondary effects related to increased development at transit stations as a result of the LPA could include effects on neighborhoods, community services, visual and aesthetic conditions, cultural resources, parks and recreation, natural resources, and traffic conditions. The LPA would have a low impact on the cumulative effects resulting from other transportation and local improvement projects, such as the new runways proposed at Dulles Airport, being implemented at the same time.

IMPLEMENTING THE PROJECT

Funding Needs and Strategy

Capital Costs

The Federal Transit Administration, the Commonwealth of Virginia, Fairfax and Loudoun counties, and Metropolitan Washington Airports Authority would provide capital funding for the project as summarized in the table below:

Capital Costs and Funding Shares

	Wiehle Avenue Extension 11.6 miles by year 2011	*Full LPA 23.1 miles by year 2015*
Costs in year of expenditure $	***$1.5 billion***	***$3.5 billion***
Federal Sources		
Federal Transit Administration	***50.0 %***	***50.0 %***
Non-Federal Sources		
Commonwealth of Virginia	***25.0 %***	***25.0 %***
Fairfax County	***25.0 %***	***16.1 %***
Loudoun County		***4.8 %***
Metropolitan Washington Airports Authority		***4.1 %***

As the project sponsor and federal grant recipient, DRPT will be applying for New Starts funding from FTA at 50 percent of the capital costs.

Federal funding has been requested for 50 percent of the capital costs for the Wiehle Avenue Extension.

The anticipated capital funding sources of the funding partners are:

- Federal Transit Administration (federal New Starts funds);
- Commonwealth of Virginia (Virginia Transportation Act of 2000, Dulles Toll Road Revenues and future transportation appropriations);
- Fairfax County (Transportation Improvement District Revenues and Fairfax County General Obligation Bonds); and
- Loudoun County (Business and Professional Occupancy License Tax Revenues).
- MWAA (Passenger Facility Charges).

Operating and Maintenance Costs

WMATA will be the operator of the project. Opening year operating and maintenance (O&M) costs were estimated for the No Build Alternative and for the project in its two phases. The O&M cost estimates in the tables below are the increase in costs of the project over the costs of the No Build Alternative in current 2004 dollars and in year-of-expenditure (YOE) dollars.

Implementation of the Locally Preferred Alternative will result in an increase in Metrorail system operations and maintenance costs.

Incremental Annual Operating and Maintenance Costs

	Wiehle Avenue Extension 11.6 miles by year 2011	**Full LPA 23.1 miles by year 2015**
Costs in 2004 $	**$39.9 million**	**$71.7 million**
Costs in opening year $	**$47.5 million**	**$93.9 million**

Operating revenues would come from a number of sources, including passenger fares, parking, joint development, advertising, concessions, and grants. An operating subsidy is required from each WMATA Compact jurisdiction to fund the difference between project operating and maintenance costs and project revenues.

COORDINATION OPPORTUNITIES

The Metrorail Extension as the Locally Preferred Alternative has been developed and advanced by a partnership of federal, state and local entities as the result of an open and collaborative public discussion of the corridor, its future needs, and potential solutions to transportation demands. The preparation of the Draft EIS, Supplemental Draft EIS, and the Final EIS was guided by a proactive, responsive public outreach and agency coordination program, with participation from thousands of people with diverse

interests from all parts of the corridor, as well as representatives from over 75 federal, regional, state, and local agencies.

Public Hearings on the June 2002 Draft EIS and October 2003 Supplemental Draft EIS provided additional opportunities for interested parties to review and comment proposed improvements.

To accommodate various degrees of participation and support the decision process, a broad range of outreach techniques was used to define the project purpose and need, design solutions, and assess potential consequences of different actions in terms of transportation, social, economic, and environmental considerations. Comments received focused mainly on the need for a rapid transit investment in the corridor, and how improvements should be designed to avoid and minimize potential effects of construction and operation on adjacent properties and resources.

In 2002, the Draft EIS was circulated for review by elected officials, government agencies, and the public, and was made available at libraries, information centers, and community centers prior to the July 2002 public hearings. The Supplemental Draft EIS was circulated in a similar manner to the Draft EIS, and public hearings were held in December 2003. Comments received on the Draft EIS and the Supplemental Draft EIS influenced the development of the project and are addressed in the Final EIS.

FUTURE ACTIONS

Environmental Process

The environmental process for the project is nearing a conclusion. The notification that the Final EIS is available and is circulating has appeared in the Federal Register. The following actions remain:

- Circulation of the Final EIS for 30 days among officials, agencies, stakeholders; and
- FTA preparation and issuance of its Record of Decision (ROD) which describes the basis of FTA's decision, alternatives considered, and mitigation measures.

Preliminary Engineering

The project continues to move forward during the new phase of preliminary engineering. Preliminary engineering is more than design and will entail the following actions:

- DRPT and WMATA coordination with agencies, property owners and stakeholders to address outstanding issues of facility design and mitigation;
- DRPT coordination with resource and regulatory agencies regarding mitigation of adverse effects and permit applications that will support construction;
- Fairfax County initiative for an alternative site plan of the Tysons West Station facilities;
- Fairfax County initiative for joint development at the north side facilities of Wiehle Avenue Station;
- WMATA technical management of preliminary engineering design and of contract documents for the design-build phase;
- DRPT preparation of a right-of-way acquisition plan and negotiation of inter-agency and utility agreements for the construction, acquisition, and operation of the project;
- DRPT preparation of the final financial plan for the Wiehle Avenue Extension, including capital and operating funding commitments;

- DRPT request for FTA approval to enter the final design phase of the Wiehle Avenue Extension;
- DRPT application to FTA for a Full Funding Grant Agreement for the Wiehle Avenue Extension; and
- Coordination for the financial planning of the remaining 11.5 miles of the full LPA.

Public Outreach Efforts

Public outreach efforts will continue throughout preliminary engineering and final design. The focus of these outreach activities will be to keep the public, stakeholders, and affected property owners informed about the project's progress.

SUMMARY OF THE LOCALLY PREFERRED ALTERNATIVE

The Final EIS provides detailed analysis of the No Build Alternative, the full LPA and its first phase, the Wiehle Avenue Extension. For easy comparison, the following table highlights the results of those analyses.

Summary of the Locally Preferred Alternative

Measures	No Build Alternative (2025)	Metrorail Extension Project		
		Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Transit Operations				
Number of Metrorail Stations	Base	5	5	11
Opening Year Ridership (Average Weekday Riders)	Base	62,800	Not Applicable	Not Applicable
Opening Year New Trips	Base	29,100	Not Applicable	Not Applicable
Forecast Year Total Ridership (Average Weekday Riders)	Base	Not Applicable	73,300	91,200
Forecast Year New Trips	Base	Not Applicable	34,400	47,800
Costs				
Capital Costs (Year of Expenditure)	$0	$1.5B	$1.5B	$3.5B
Capital Funding Sources	Not Applicable	50% Federal 50% Non Federal	50% Federal 50% Non Federal	50% Federal 50% Non Federal
Incremental Annual O&M Costs (YOE)	Base	$47.5M	$67.6M	$117.9M
Social Effects				
Consistent with Comprehensive Plans	No	Partially	Partially	Yes
Residential Displacements (No.)	0	0	0	0
Commercial Displacements (No.)	0	3	3	3
Residential Properties Partially Acquired (No.)	0	11	11	11
Shifts in Population and Employment	Unlikely	Likely	Likely	Likely
Overall Visual Impacts	Continues Current Conditions	Minimal	Minimal	Minimal
Cultural Resources (Adverse Effect)	0	0	0	1
Section 4(f) Direct Use (No.)	0	0	0	1
Environmental Effects				
Streams Impacts (Linear feet)	0	0	0	245
Wetlands Impacts (Acres)	0	0	0	5.2
Floodplains Impacts (No. of 100-year crossings)	0	3	3	5
Air Quality – NAAQS Violations	None	None	None	None
Noise Receptors Above FTA Criteria Before Mitigation	0	184	184	183
Vibration Receptors Above FTA Criteria Before Mitigation	0	7	7	7
Hazardous Materials Generators Potentially Affected	0	4	4	11
Economic Effects				
Corridor Development Potential	304,638,650 SF	Not Applicable	+5%	+13%
Corridor Employment	403,857	+3%	+6%	+16%

Measures	No Build Alternative (2025)	Metrorail Extension Project		
		Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Property Values Near Station Areas	Continues Current Conditions	Likely to Increase	Likely to Increase	Likely to Increase
Transportation Effects				
Transit Capacity (at Tysons Central 123 Station)	400	7,680	8,640	8,640
Transit Mode Share (at Tysons Corner)				
- Home Based Work Trips Attracted to Corridor	8.4%	11.9%	11.6%	12.6%
- Home Based Work Trips Produced in Corridor	25.9%	33.5%	34.3%	34.4%
Number of intersections at LOS F (pm peak)	16	3	6	16
Existing and Planned Parking Spaces at Park-and-Ride Stations	4,800	5,600	6,300	14,350

Below is a summary of major mitigation measures. A more comprehensive listing of proposed mitigation measures is presented in Chapter 2 of the FEIS.

Mitigation of Effects

Area	Summary of Mitigation Measures
Land Use and Socioeconomics	Assist Fairfax and Loudoun counties and the Town of Herndon to pursue transit-oriented development and joint development opportunities. Fairfax County will incorporate the park-and-ride requirements (500 spaces) for the Tysons West station into the Fairfax County Comprehensive Plan.
Property Acquisition and Displacements	All property acquisitions would be conducted in accordance with the Uniform Relocation Assistance and Real Property Acquisition Act, as amended.
Visual and Aesthetic Conditions	Minimize the potential visual and aesthetic effects through sensitive design of the Metrorail facilities and landscaping.
Cultural Resources	Preserve and enhance the historic design features of the Dulles Airport Historic District through appropriate design and activities to increase public awareness of the district's unique historic characteristics.
Parklands	Design the proposed Metrorail overpass in the W&OD Railroad Regional Park according to the ***NVRPA Guideline for the Development of W&OD Trail Bridge Crossings***. Maintain public use of the W&OD Railroad Regional Park and minimize disruption of Pimmit Run Stream Valley Park, Scotts Run Stream Valley Park, and Difficult Run Stream Valley Park during construction.
Safety and Security	Conform WMATA's Safety and Security Program with Dulles Airport measures and develop mutual aid agreements with local jurisdictions. Where the alignment traverses airport property, there would be no tunnel exits of any kind in the secure zone of the airport.
Water Resources	Plant riparian buffers to protect affected surface waters and water quality, provide compensatory mitigation for unavoidable wetlands impacts associated with the S&I Yard on Dulles Airport property and the Route 28 station, and avoid changes in floodplain elevations(s) of more than 1 foot. Coordinate with Fairfax and Loudoun counties to ensure consistency with local stream protection policies and coordinate with FAA to control potentially hazardous wildlife interference of airport operations.
Noise	Install parapet and trackside noise barriers near sensitive areas, reduce noise impacts of the improved West Falls Church Yard facilities, and comply with WMATA, FTA, and local regulations and policies. Analyze reflective highway noise impacts to the Hallcrest Heights residential community during preliminary engineering and/or final design.
Vibration	Utilize dampening materials or devices under switches and crossovers near sensitive receptors.
Transportation Effects	Construct roadway improvements, such as new turn and acceleration lanes, to increase access to the Tysons Central 123, Wiehle Avenue, Route 606 stations, and the Yard Site 15 facilities and to mitigate traffic impacts at the Tysons East, Wiehle Avenue, Reston Parkway, Herndon-Monroe, and Route 606 stations.
Construction Effects	Prepare plans for erosion and sediment control and maintenance of traffic, and use applicable Best Management Practices. Comply and coordinate with relevant local, state and federal regulations and agencies to address construction-related activities. Communicate and coordinate with affected local businesses and communities.

DULLES CORRIDOR RAPID TRANSIT PROJECT
FINAL ENVIRONMENTAL IMPACT STATEMENT

ABSTRACT

This Final Environmental Impact Statement (EIS), describes modifications that have been made to the Dulles Corridor Rapid Transit Project since the publication of the *Dulles Corridor Rapid Transit Project Draft Environmental Impact Statement and Section 4(f) Evaluation* (Draft EIS) in June 2002, the selection of the Locally Preferred Alternative (LPA) in December 2002, and the publication of the *Dulles Corridor Rapid Transit Project Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* (Supplemental Draft EIS) in October 2003. The Final EIS has been prepared to identify the improvements of the LPA, document the basis for the decision, and commit to mitigation measures that will offset adverse effects. A comparative evaluation of the No Build Alternative and LPA and associated costs is also included, as are public comments received on the Draft EIS and Supplemental Draft EIS as well as responses to those comments.

The Dulles Corridor Rapid Transit Project is proposed to improve mobility and transit accessibility in the rapidly developing and congested Dulles Corridor. The limits of the project extend from the vicinity of the West Falls Church Metrorail Station in Fairfax County to the vicinity of Route 772 in Loudoun County. The corridor is bounded by Routes 193 and 7 on the north and US 50 on the south. The project corridor is approximately 23.1 miles in length. The LPA evaluated in the Final EIS would operate the entire length of the project corridor, from West Falls Church to Route 772. The project is proposed in two phases: Wiehle Avenue Extension and the full LPA.

The Wiehle Avenue Extension would have an alignment length of approximately 11.6 miles and would operate from the Orange Line near the West Falls Church Metrorail Station to Wiehle Avenue. It also provides express bus service between Wiehle Avenue and Loudoun County. This phase of the LPA has an opening year of 2011 with the final phase, from Wiehle Avenue to Route 772, opening in 2015.

This Final EIS is available for review. Following the close of the circulation period indicated in the Notice of Availability, FTA will issue a Record of Decision (ROD). The ROD will identify the action to be undertaken, alternatives considered, environmental findings resulting from the proposed action, and mitigation commitments associated with project implementation.

TABLE OF CONTENTS

VOLUME I

S.0 EXECUTIVE SUMMARY S-1

1.0 PURPOSE AND NEED FOR THE PROPOSED ACTION 1-1

1.1 OVERVIEW 1-2

1.2 PROPOSED ACTION 1-5

1.3 PLANNING CONTEXT 1-10
1.3.1 Previous Studies and Plans 1-10
1.3.2 Future Plans 1-12
1.3.3 Related Studies 1-15
1.3.4 Environmental Review and Project Development Process 1-16

1.4 DESCRIPTION OF THE REGION AND CORRIDOR 1-18
1.4.1 Region and Corridor Boundaries 1-21
1.4.2 Corridor Activity Centers 1-21
1.4.3 Corridor Transportation System 1-29
1.4.4 Travel Patterns 1-33

1.5 NEED FOR IMPROVEMENTS 1-37
1.5.1 Anticipated Population and Employment Growth 1-37
1.5.2 Future Land Use and Development Plans 1-40
1.5.3 Increased Travel Demand 1-40
1.5.4 Limitations of the Existing Roadway System 1-41
1.5.5 Limitations of the Existing Transit System 1-42
1.5.6 Air Quality 1-43

1.6 GOALS AND OBJECTIVES 1-43

2.0 ALTERNATIVES CONSIDERED 2-1

2.1 ALTERNATIVES PREVIOUSLY CONSIDERED 2-1

2.2 DRAFT EIS ALTERNATIVES AND RECOMMENDATIONS 2-6

2.3 SUPPLEMENTAL DRAFT EIS ALTERNATIVES AND RECOMMENDATIONS ... 2-8

2.4 FINAL EIS ALTERNATIVES 2-10
2.4.1 No Build Alternative 2-10
2.4.2 Locally Preferred Alternative 2-22
2.4.3 Comparative Evaluation of Alternatives 2-47

3.0 SOCIAL EFFECTS.....3-1

3.1 LAND USE AND SOCIO-ECONOMICS.....3-2
3.1.1 Methodology.....3-2
3.1.2 Existing Conditions and Future Projections.....3-3
3.1.3 Long-Term Effects.....3-15
3.1.4 Construction Effects.....3-19
3.1.5 Mitigation.....3-20

3.2 NEIGHBORHOOD, COMMUNITY SERVICES AND COMMUNITY COHESION IMPACTS.....3-20
3.2.1 Methodology.....3-20
3.2.2 Existing Conditions.....3-22
3.2.3 Long-Term Effects.....3-33
3.2.4 Construction Effects.....3-39
3.2.5 Mitigation.....3-39

3.3 PROPERTY ACQUISITION AND DISPLACEMENT.....3-39
3.3.1 Legal and Regulatory Context.....3-40
3.3.2 Methodology.....3-40
3.3.3 Long-Term Effects.....3-40
3.3.4 Construction Effects.....3-42
3.3.5 Mitigation.....3-43

3.4 VISUAL AND AESTHETIC CONDITIONS.....3-43
3.4.1 Methodology.....3-43
3.4.2 Existing Conditions.....3-43
3.4.3 Long-Term Effects.....3-60
3.4.4 Construction Effects.....3-63
3.4.5 Mitigation.....3-64

3.5 CULTURAL RESOURCES.....3-64
3.5.1 Legal and Regulatory Context.....3-64
3.5.2 Methodology.....3-65

L FEDERAL CONSISTENCY DETERMINATION

1 PURPOSE AND NEED FOR THE PROPOSED ACTION

This chapter describes the Dulles Corridor and identifies the need for the proposed Dulles Corridor Rapid Transit Project.

The alternative formerly known as "LPA Phase 1" in the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* has been renamed the Wiehle Avenue Extension in this Final EIS and is expected to begin operations in 2011. This change reflects the federal approach to the project's funding under the Federal Transit Administration's New Starts program. It will assure consistency among the environmental, engineering and financial documents during the project's development.

In the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* as well as this Final EIS, the term "full LPA" represents the Wiehle Avenue Extension and the second phase of the Dulles Corridor Rapid Transit Project. This second phase would extend west from Wiehle Avenue to Washington Dulles International Airport and Route 772 and is expected to begin operations in 2015.

The term "LPA", "proposed action", or "selected LPA" refers to both the Wiehle Avenue Extension and the full LPA collectively.

Section 1.1 provides an overview of the Dulles Corridor, the corridor needs, and the proposed project. It also includes a brief introduction of the various sponsoring agencies for the project.

Section 1.2 briefly introduces the proposed action for the Dulles Corridor Rapid Transit Project.

Section 1.3 describes the planning context in which the Dulles Corridor Rapid Transit Project was developed, including identification of the various methods used to create public involvement opportunities. In addition to a discussion of previous studies, related studies, and plans, the section includes an overview of the role of this Final Environmental Impact Statement (EIS) in the environmental review and project development process.

Section 1.4 defines the boundaries of both the Washington metropolitan region and the Dulles Corridor, and describes key characteristics of both. The activity centers within the corridor are identified, the existing transportation network is described, and the overall travel patterns between the corridor and the region are outlined.

Section 1.5 discusses the need for transportation improvements in the Dulles Corridor.

Section 1.6 identifies the goals and objectives of the project, which were used to evaluate the relative merits of the alternatives under consideration in this Final EIS.

1.1 OVERVIEW

The Dulles Corridor, located in Northern Virginia, west of the nation's capital (see Figure 1.1-1) is home to several of the Washington metropolitan region's most dynamic and rapidly growing activity centers. Extending from the vicinity of West Falls Church Metrorail Station in Fairfax County, Virginia, to Route 772 in Loudoun County, Virginia, the 23-mile corridor includes the high-density office buildings and regional shopping centers of Tysons Corner; the residences, shopping centers, and suburban office complexes of the Reston-Herndon area; the rapidly growing Washington Dulles International Airport (Dulles Airport); and an emerging residential and employment center in eastern Loudoun County.

With the Dulles Corridor's increasing attractiveness as a place to live and work, travel in the corridor has been steadily growing over the past 15 years. This increasing travel demand has strained the capacity of the existing transportation network, causing delays and increasing travel times between activity centers within the corridor and the region. The central and eastern portions of the corridor currently experience some of the region's worst traffic congestion.

Over the next 25 years, continued development of the corridor as a regional employment destination, and the maturation of residential communities and commercial areas within the corridor, is expected to far outpace the growth of the region as a whole. Parallel increases in travel demand are projected to exceed the capacity of the corridor's already overburdened transportation system, resulting in severely congested conditions on numerous routes, further degradation of air quality, and a threat to the valued quality of life in the Dulles Corridor.

The ability to expand roadway capacity in the corridor beyond currently planned improvements is limited. Planned roadway enhancements are not expected to relieve the current state of congestion, which is already near or at gridlock conditions in many locations. Moreover, the existing corridor transit system is limited as an alternative to auto travel because local bus service is also hampered by traffic congestion. Given these factors and a need to reduce auto emissions in the region to meet federal air quality standards, alternative transportation improvements in the Dulles Corridor, such as a high-quality, high-capacity rapid transit line, have long been the focus of public and private sector studies.

Rapid transit in the Dulles Corridor was initially explored in the 1950s as part of the planning of Dulles Airport. At that time, it was decided to reserve the median of the Dulles International Airport Access Highway (DIAAH), previously known as the Dulles Airport Access Road, for future transit access to the airport. Subsequently, the need for transit in the corridor was evaluated in the late 1960s during the planning of the regional Metrorail system. While Metrorail's original Adopted Regional System did not include a connection to Dulles Airport, extending rapid transit service to the airport has remained a local and regional goal.

In recent years, providing a rapid transit connection to Dulles Airport was evaluated in the *Dulles Corridor Transportation Study* (1997) and the *Supplement to the Dulles Corridor Transportation Study* (1999). The former, a Major Investment Study (MIS), recommended developing a rail line between the Metrorail Orange Line and Route 772 primarily using the median of the DIAAH. The MIS Supplement in 1999 recommended developing this rail line through a phased implementation program that would begin with enhanced express bus services, then use bus rapid transit (BRT) technology to institute rapid transit service in the Dulles Corridor as quickly as possible. BRT is an emerging transit mode in which buses are used to provide high-quality service akin to a rapid rail system. The BRT line would then be converted to rail use as project development progressed.

Figure 1.1-1

Dulles Corridor

Dulles Corridor Rapid Transit Project

Most recently, these recommended transit alternatives for the Dulles Corridor were evaluated for the *Dulles Corridor Rapid Transit Project Draft Environmental Impact Statement and Section 4(f) Evaluation* (Draft EIS) published in June 2002. The results of the evaluation assisted the Commonwealth of Virginia, the Washington Metropolitan Area Transit Authority (WMATA), the Federal Transit Administration (FTA), the Federal Aviation Administration (FAA), local and regional decision-makers, and the public in understanding the potential effects of the alternatives under consideration for the project and in selecting a proposed action. Based on the analysis contained in the Draft EIS, public comments received on the document, and agency coordination, a new Metrorail extension from the existing Orange Line to Route 772 in Loudoun County was selected as the Locally Preferred Alternative (LPA) for the project by the Commonwealth Transportation Board (CTB) and by the WMATA Board of Directors in late 2002. Like the alternative recommended in the 1997 MIS, the rail line would primarily use the median of the DIAAH, leaving the highway to directly serve Tysons Corner and Dulles Airport. However, unlike the recommendations of the MIS Supplement, the selected LPA was not proposed to be developed through a phased implementation program that included BRT as an interim step to rail.

Following the publication of the Draft EIS and selection of the Metrorail Alternative as the LPA, additional agency and public coordination resulted in revisions to the selected LPA. The potential effects of these changes—which included design modifications to the preferred alignment and facilities, adjustment of opening years, and scheduling construction of the project in two phases—were documented in the *Dulles Corridor Rapid Transit Project Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* (Supplemental Draft EIS) published in October 2003. Although many of the merits and potential impacts of the proposed LPA were similar to those presented in the Draft EIS, the Supplemental Draft EIS allowed decision makers to fully and explicitly examine the effects of the revised LPA compared to the Metrorail Alternative evaluated in the Draft EIS and a No Build Alternative. Based on the analysis contained in the Supplemental Draft EIS, public comments received on the document, and agency coordination, in March 2004 the CTB approved the revision of the LPA to incorporate the elements required for phased construction and the design refinements outlined in the Supplemental Draft EIS and recommended in its Public Hearings Report. In April 2004, the WMATA Board of Directors took similar action to revise the LPA.

The Locally Preferred Alternative, as it is now defined, is described and evaluated in this Final EIS (See Figure 1.1-2). The following chapters contain an analysis of the relative merits and potential impacts of these improvements, as compared to a No Build Alternative.

1.2 PROPOSED ACTION

Based on work completed in prior studies, and in order to respond to continuing transportation needs in the Dulles Corridor, Department of Rail and Public Transportation (DRPT) and WMATA have proposed the Dulles Corridor Rapid Transit Project. The proposed project consists of transit system enhancements operating in the 23-mile Dulles Corridor, providing a seamless connection to the existing Metrorail system. These enhancements would offer an alternative means of travel for the growing number of residents, employees, and visitors in the Dulles Corridor and, as a high-quality link to the Metrorail system, would improve mobility throughout the region. By providing a high-capacity transportation choice for travelers, the proposed project would be better able to meet the anticipated increases in travel demand and help reduce future congestion in the corridor. Moreover, the ability of the proposed improvements to increase person-moving capacity over long distances with fewer numbers of vehicles should help minimize future increases in vehicle miles traveled in the corridor and vehicle emissions.

Figure 1.1-2

Locally Preferred Alternative

Dulles Corridor Rapid Transit Project

The LPA for the Dulles Corridor Rapid Transit Project is an extension of the regional Metrorail system, which would provide service to key activity centers along the corridor, including Dulles Airport. Metrorail is a high-speed passenger rail system that is powered by an electrified third rail and operates in exclusive rights-of-way. By using multiple-car trains, Metrorail is capable of moving high volumes of passengers. Key features of the Metrorail system are fixed stations, dedicated right-of-way, advanced fare collection, relatively simple transfers between different lines, and multiple-door boarding from level platforms.

The LPA follows an alignment that primarily runs along the Dulles Connector Road, the DIAAH, and the Dulles Greenway. At its eastern end, the alignment would directly connect to the Metrorail Orange Line, allowing eastbound trains on the Dulles Corridor line to continue on to East Falls Church Station and the region's core. Passengers traveling to points east on the Orange Line would not have to transfer; passengers from the Dulles Corridor wishing to travel to points west on the Orange Line would change trains at East Falls Church Station. Through the Dulles Corridor, the LPA would operate at ground level in the median of the Dulles Connector Road, the DIAAH, and the Dulles Greenway, diverting at Tysons Corner and Dulles Airport to provide direct service to these key activity centers.

In the central portion of the Dulles Corridor, the LPA includes stations located in the median of the DIAAH. These median stations would have a similar design to those on the existing Metrorail system, and passengers would access the stations via pedestrian bridges that connect to station facilities located on the north and/or south sides of the Dulles Toll Road.

The LPA also includes one underground station and three aerial stations in Tysons Corner, an underground station at Dulles Airport, and additional median stations along the Dulles Greenway.

The LPA would include a new rail Service & Inspection (S&I) yard near the western end of the corridor, as well as traction power substations, tie-breaker stations, and stormwater management facilities. Traction power substations and tie-breaker stations (ancillary facilities associated with the supply of power to the rail line) would be located at various points along the alignment. In addition, the project would include a new lead track to the West Falls Church S&I Yard and other improvements to accommodate the new rail line. Improvements would include new storage tracks, new maintenance bays in the S&I building, and a sound attenuation box over the existing loop track and a portion of the new lead track.

A more detailed description of the selected Locally Preferred Alternative and a description of the No Build Alternative are presented in Chapter 2.

The proposed project would be constructed in two phases. The phasing of construction is necessary to spread the costs of construction over a longer period of time to reduce annual funding needs. FTA is considering only the first phase of construction (i.e., the segment between West Falls Church and Wiehle Avenue) for New Starts funding from the anticipated six-year reauthorization of the Federal New Starts program. FTA may consider the proposed subsequent phase for FTA funding in the future but has made no commitment to do so. Furthermore, FTA has determined that the first phase now being considered for funding has independent utility even if the subsequent phase is never built. (The first phase serves the high employment area of Tysons Corner.) Therefore, FTA will make a decision on the funding of the first phase without regard to possible future phases.

The Commonwealth of Virginia has proposed the following approach to implement the LPA: DRPT would be the project sponsor, federal grant recipient, design/build contracting authority, and initial owner. WMATA would be DRPT's technical manager for preliminary engineering and for the design/build contract, leaseholder, operator of the project, and ultimate owner.

1.3 PLANNING CONTEXT

The planning context for the Dulles Corridor Rapid Transit Project includes previous studies and plans, related studies, and the overall process for project development. In the following sections, previous studies related to transit in the Dulles Corridor and plans that include the project as a future improvement are identified, and related studies that would affect or be affected by the project are discussed. In addition, its relationship to the purpose of the Final EIS is explained in more detail, its relationship to the environmental review and project development process is described, and decision-making bodies and required approvals are identified.

1.3.1 PREVIOUS STUDIES AND PLANS

Over the last four decades the transportation needs of the Dulles Corridor and potential improvements for the corridor have been the subject of several studies conducted by public agencies and private businesses. Most of the studies have identified mass transit alternatives as part of the transportation solution for the corridor and, as a result, numerous comprehensive and regional plans have included references to specific transit alternatives, supportive land use measures, and potential funding sources for the Dulles Corridor. Proposed transit solutions for the Dulles Corridor have also been recognized at the federal level, including the identification of the Dulles Corridor Rapid Transit Project as one of the candidate projects to receive federal funding in the *Transportation Equity Act for the 21st Century* (TEA-21), a federal law that authorizes the government to fund transportation projects.

In the following sections the major studies and plans related to the Dulles Corridor are identified and the alternatives or measures proposed in them are briefly described.

1.3.1.1 Recent Studies

This section includes a discussion of those studies that led most directly to the development of the Dulles Corridor Rapid Transit Project and this Final EIS.

A. Dulles Corridor Transportation Study and Supplement (1997, 1999)

DRPT initiated the *Dulles Corridor Transportation Study*, a Major Investment Study (MIS), as a response to the *Dulles Corridor Plan*, adopted by the CTB in 1992. The study and its 1999 Supplement were conducted with the oversight of a policy advisory committee and a technical committee, the guidance of three county-sponsored task forces and committees, and ideas and comments received through extensive public participation.

For the MIS and its Supplement, the study team examined the growth projections for the Dulles Corridor and the region, analyzed changes in travel patterns resulting from development in the corridor, considered a variety of transportation improvements to reflect the identified travel needs, and discussed the costs, benefits, and impacts of these alternatives. It was also determined that the transit improvements should begin at the Orange Line and terminate in eastern Loudoun County, due to the amount of growth projected there.

It was recommended in the MIS that a rail extension of the Metrorail system be implemented in the median of the DIAAH and the Dulles Greenway. The study team for the MIS Supplement subsequently recommended that this rail line be implemented through a multi-modal transportation investment program. The program would begin with express bus service, and then enhanced express bus services would be

implemented. Subsequent phases included developing a BRT system along the DIAAH and converting this BRT system to a rail line in two stages.

B. Dulles Corridor Rapid Transit Project Draft Environmental Impact Statement and Section 4(f) Evaluation (2002)

The BRT and rail alternatives and the proposed phasing approach developed during the MIS and MIS Supplement were carried forward as the Dulles Corridor Rapid Transit Project. The project is identified in TEA-21 as one of the candidate projects to receive federal funding from FTA. Under the National Environmental Policy Act of 1969 (NEPA), as amended, federal agencies must consider the environmental consequences associated with all alternatives for a project involving federal action. This evaluation of environmental consequences is required to assist decision-makers and the public in evaluating the relative merits of the project (as compared to a No Build Alternative) and in selecting a preferred course of action from the alternatives evaluated.

To address environmental requirements under NEPA and to further advance the project development and review process, a Draft EIS was prepared for the Dulles Corridor Rapid Transit Project. The Draft EIS documents the potential social, environmental, economic, and transportation effects of constructing and operating the proposed rapid transit improvements in the Dulles Corridor. Several alternatives were considered, including a No Build or Baseline Alternative, a BRT Alternative, a Metrorail Alternative, an alternative that combines these modes (BRT/Metrorail Alternative), and a Phased Implementation Alternative, in which the alternatives are implemented through a staged program of rapid transit improvements. All of the proposed Build Alternatives follow an alignment that generally runs along the Dulles Connector Road, the DIAAH, and the Dulles Greenway. Several alignment variations in Tysons Corner and along the DIAAH were examined for each alternative, and multiple rail yard sites were considered for the Metrorail and Phased Implementation alternatives.

Based on the analysis contained in the Draft EIS, agency coordination, and comments received during the public review process, the Metrorail Alternative (T6) with a service and inspection (S&I) yard near Dulles Airport (Y15) was selected in late 2002 by the CTB and the WMATA Board of Directors as the LPA for the project. More detailed information about the evaluated alternatives can be found in Chapter 2 of this Final EIS.

C. Dulles Corridor Rapid Transit Project Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation (2003)

After the selection of the LPA, continuing public and agency coordination resulted in modifications to the proposed project, including design modifications to the alignment and facilities and proposed construction of the project in two phases. A Supplemental Draft EIS was prepared to assess the potential effects of the revised LPA on the human and natural environment and to provide a basis for further public discussion. Effects were evaluated relative to those anticipated for a No Build Alternative and the Metrorail Alternative (T6/Y15) evaluated in the Draft EIS and selected as the LPA. In general, the effects and merits of the revised LPA were similar to those presented in the Draft EIS.

Based on the analysis contained in the Supplemental Draft EIS, public comments received on the document, and agency coordination, in March 2004 the CTB approved the revision of the LPA to incorporate the elements required for phased construction and the design refinements outlined in the Supplemental Draft EIS and recommended in the Public Hearings Report. In April 2004, the WMATA Board of Directors took similar action to revise the LPA.

1.3.1.2 Earlier Corridor Studies and Plans

Table 1.3-1 identifies and briefly describes early studies in which high-capacity transit or supportive elements were considered for the Dulles Corridor. Many of the studies recommended potential transportation solutions for the corridor as a whole, whereas others addressed a particular part of the corridor.

Table 1.3-1: Early Corridor Studies and Plans

Study/Plan	Description and Recommendations
Dulles International Airport – Master Plan Report (1964)	The original Master Plan for Dulles Airport envisioned the eventual construction of transit to the airport, indicating that the design of the access road included reserved space in the median which "might ultimately be employed to provide some form of mass transportation, utilizing either bus or rail transit," (Ammann & Whitney, et al. 1964: 49). In 1985, during the update process for the Dulles Airport Master Plan, FAA recommended that the median of the DIAAH continue to be reserved for a future transit line to the airport. It was anticipated that the future transit line would likely be an expansion of the Metrorail system.
Adopted Washington Regional Metrorail System (1969)	Serving Dulles Airport with rail transit was considered during WMATA's initial planning and construction of the Metrorail system. However, a Metrorail extension to Dulles Airport was not included in the original Adopted Regional System because the level of development in the corridor did not warrant an extension at that time.
Northern Virginia Light Rail, Inc. (1983)	In response to a perceived need for transit improvements in the Dulles Corridor, a private consortium known as Northern Virginia Light Rail, Inc. proposed to collect contributions from local developers to build a light rail line to Dulles Airport. Operation of the line would be turned over to WMATA following construction.
Dulles Corridor Transit Development Feasibility Study (1985)	For this study, private-sector strategies for funding transit improvements in the Dulles Corridor were examined. A number of private and public funding mechanisms were considered, and it was determined that a combination of these mechanisms could be used to develop funding for a Dulles Corridor rail line.
DartRAIL (1985 – 1992)	A private group named Dulles Access Rapid Transit (DartRAIL) proposed building a rail transit line between the West Falls Church Metrorail Station and Dulles Airport. Proposed funding sources included surplus Dulles Toll Road revenues and assessments and donations from interested parties, property owners, developers, and the operators of Dulles Airport.
Dulles Airport Access Road Corridor Transit Alternatives Analysis Study (1990)	To evaluate various transit options for the corridor, Fairfax County sponsored an alternatives analysis study that focused on the DIAAH (then called the Dulles Airport Access Road). Study recommendations included pursuing an enhanced express bus system to serve residential neighborhoods and a number of new park-and-ride lots throughout the corridor. The initial elements of the recommended system have since been implemented.
Dulles Corridor Plan (1992)	Recognizing the need for improved transit access in the Dulles Corridor, the CTB passed a resolution that led to the adoption of the *Dulles Corridor Plan*. The plan endorsed implementation of rail in the Dulles Corridor by 2005. Interim development of high-level bus service and park-and-ride lots were among the actions identified.

1.3.2 FUTURE PLANS

Several local and regional plans identify the Dulles Corridor Rapid Transit Project as an element of the future transportation network. The project is included in these plans as an essential element in meeting future transportation and development goals.

1.3.2.1 County Transportation and Comprehensive Plans

The planned improvements for the Dulles Corridor Rapid Transit Project, or supportive measures for the project, are included in the following plans, which identify needs and planned improvements for the counties as a whole:

- *Fairfax County Transportation Plan* (1995);
- *Fairfax County Comprehensive Plan* (2000);
- *Loudoun County Countywide Transportation Plan* (1995, revised 2001); and
- *Loudoun County Revised General Plan* (2001).

Because they were completed prior to the 1997 MIS and its 1999 Supplement, the two transportation plans include less specific actions relative to the Dulles Corridor. In the *Fairfax County Transportation Plan*, the corridor is referenced in the plan's transportation enhancement map, on which the corridor is highlighted. The *Loudoun County Countywide Transportation Plan* generally recognizes a need to plan for supportive land uses in the vicinity of future transit centers in specific corridors, including centers at the western end of the Dulles Corridor.

The county comprehensive plans, on the other hand, include much more specific measures in support of planned improvements in the Dulles Corridor. The Fairfax County plan calls for dense development in the corridor, ranging from 8 to 45 dwelling units per acre with a Floor Area Ratio (FAR) – a ratio of the gross floor area of a building to the total area of the site – in excess of 1.0. Higher-density, mixed-use development will be allowed in the core of Tysons Corner in conjunction with proposed rail stations. The Loudoun County plan allows for up to 50 dwelling units per acre to support proposed transit stations along the Dulles Greenway. The *Loudoun County Revised General Plan* also includes public support for transit services that would use the corridor, such as carpools, vanpools, bus and rail services, and other alternative modes, with specific funding support for bus services.

During work on the Draft EIS, the Dulles Corridor Land Use Task Force was appointed by the Fairfax County Board of Supervisors to review the *Fairfax County Comprehensive Plan* as part of the County's commitment to transit supportive policies in the corridor. The Task Force reviewed the plan's existing land use recommendations for the corridor and recommended changes to better support transit in the Dulles Corridor, such as density increases and mixed-use provisions triggered by the implementation of BRT or Metrorail, and a set of design guidelines that encouraged transit-oriented development. Fairfax County reviewed these changes, and a modified set of changes was forwarded to the County Board of Supervisors for approval. The resulting amendments to the Fairfax County Comprehensive Plan were formally adopted in June 2001 and are described in Chapter 3.

1.3.2.2 Regional Plans and Initiatives

The Dulles Corridor Rapid Transit Project, or supportive measures for the project, are also specifically identified in several regional plans. These regional plans, identified below, focus on issues and needs for the Washington metropolitan region as a whole, or for portions of the region.

- *Update to the Financially Constrained Long-Range Transportation Plan for the National Capital Region* (2003)
- *Transportation Improvement Program (TIP) for the Washington Metropolitan Region FY 2004-2009* (2003)
- *State Implementation Plan (SIP) Severe Area Attainment Plan for the Metropolitan Washington, D.C. Nonattainment Area* (2004)
- *WMATA 10-Year Capital Improvement Plan* (2002)
- *Northern Virginia 2020 Transportation Plan* (1999)

The National Capital Region Transportation Planning Board develops the constrained long-range plan (CLRP) and the TIP for the region. They include projects that are designed to ensure environmental quality and maintain the regional transportation system. All planned projects or studies included in the

CLRP are those for which funds are "reasonably expected to be available." Highway, transit, and pedestrian/bicycle projects, as well as regional transportation studies, are included. The TIP translates the CLRP into a program of action for the current six-year period. The Dulles Corridor Rapid Transit Project was initially identified in both plans as the phased implementation of rail service in the corridor between the existing Metrorail Orange Line and Route 772 in Loudoun County, with all phases included in the CLRP and the early phases of the project (express bus and fixed-guideway bus) programmed in the TIP. In January 2003, the 2002 CLRP was amended with a resolution to reflect the selection of the LPA for the Dulles Corridor Rapid Transit Project and the capital cost information for the LPA.

The SIP outlines measures and identifies projects intended to help the region achieve or maintain attainment status for six criteria pollutants. The *Severe Area Attainment Plan for the Metropolitan Washington, DC Nonattainment Area* was developed by the Metropolitan Washington Air Quality Committee (MWAQC), a multi-jurisdictional committee established by the governors of Maryland and Virginia and the mayor of Washington, D.C., to focus on air quality issues in the Washington metropolitan region. The plan, which was incorporated into the SIPs for Maryland, Virginia, and Washington, D.C., identifies transportation emissions control measures intended to bring the region into attainment for ozone. These measures should help reduce emissions by 2020. The Dulles Corridor Rapid Transit Project, as defined in the TIP, is considered one of these measures.

In November 2002, the WMATA Board approved the transit agency's 10-year Capital Improvement Plan (CIP). The CIP evolved from the *Metrorail Core Capacity Study,* WMATA, 2001; the Regional Bus Study; and the Infrastructure Renewal Program for Metrorail and Metrobus. Due to the fiscal constraints of the WMATA Compact member jurisdictions, the plan as a whole could not become a funded program. The WMATA Board did identify, by resolution in January 2003, the "unfunded urgent priorities" of the CIP. Those priorities became the basis of the current Metro Matters program, whereby WMATA has successfully garnered funding agreements among its Compact jurisdictions for the most crucial elements of the CIP's Infrastructure Renewal Program and its Systems Access Program. The Metrorail sub-element of Metro Matters is most important for the Dulles Corridor Rapid Transit Project since it implements eight-car train operations. Metro Matters would fund the Metrorail improvements of the No Build Alternative described in the FEIS. The evaluation of Build Alternatives in the Draft EIS, Supplemental Draft EIS, and this Final EIS have assumed that the No Build Alternative includes eight-car train operations.

The Metro Matters implementation of eight-car train operations involves the procurement of 26 rail cars, expansion of maintenance shops at three yards, upgrade to traction power, and upgrade of automatic train control. Implementation would provide eight-car train operations making up one-third of peak period Metrorail operations. The CIP's System Access Program also addresses the service reliability of the Metrorail System. Prior to the opening year of the Wiehle Avenue Extension, WMATA will reconfigure the Blue Line and other lines and increase headways from six to seven minutes.

The *Northern Virginia 2020 Transportation Plan* was developed by the Transportation Coordinating Council of Northern Virginia to meet the transportation needs of the western portion of the Washington metropolitan region. Because the proposed project is consistent with the Northern Virginia goals of reducing commute times, improving regional trip times, and increasing transportation options, the phased implementation of Metrorail in the Dulles Corridor (as recommended in the MIS Supplement) is included in the 2020 Plan.

1.3.3 RELATED STUDIES

The Dulles Corridor Rapid Transit Project is related to several recently completed or ongoing studies. Decisions to be made for this project may be affected by the outcomes and decisions associated with these related studies, and vice versa. These studies and their relationship to the Dulles Corridor Rapid Transit Project are summarized in Table 1.3-2.

Table 1.3-2: Related Studies

Study/Plan	Description and Recommendations	Relationship to Project
Metrorail Core Capacity Study, WMATA (2001)	Examined the capacity limits of the existing Metrorail system relative to projected ridership growth. Recommendations included improvements to maximize peak period capacity and the reliability of the existing system, such as the implementation of eight-car train operations, reconfiguration of Blue and Orange line service patterns, and associated improvements.	The baseline condition assumed for the Dulles Corridor Rapid Transit Project includes several improvements to the existing Metrorail system that would be required to meet growth in passenger demand by 2025 and the opening years. These improvements are identified in the Core Capacity Study, planned in the 10-Year CIP, and to be funded initially by Metro Matters.
Metro Matters, WMATA (2003)	The "unfunded urgent priorities" of the CIP became the basis of the current Metro Matters initiative, whereby WMATA seeks funding from federal sources and its Compact jurisdictions for the most crucial elements of the CIP's Infrastructure Renewal Program and its Systems Access Program.	The Metrorail sub-element of Metro Matters implements eight-car train operations.
Capital Beltway Study, Virginia Department of Transportation (VDOT) (ongoing)	Study to identify, design, and assess the best combination of improvements for the Capital Beltway in Virginia. The study area for the proposed improvements extends 14 miles, from Backlick Road in Springfield (the western limits of the Springfield interchange) to the American Legion Bridge, crossing through the eastern end of the Dulles Corridor. Proposed improvements are identified in the Capital Beltway Study Draft EIS (published in March 2002).	This project and the Dulles Corridor Rapid Transit Project will overlap in the vicinity of the Beltway/Route 123 interchange. Metrorail has a higher profile than necessary in order not to conflict with proposed directional ramps of the interchange. During preliminary engineering, both projects' staffs will continue to work together to coordinate engineering designs.
Capital Beltway Corridor Rail Feasibility Study, DRPT (2001)	Assessed the feasibility of a fixed-guideway service in the Beltway Corridor between Springfield and Tysons Corner. Several options in the Beltway Corridor were deemed feasible, and several modes and alignments were recommended for further analysis.	Any Beltway Corridor improvements extending into Tysons Corner would need to be coordinated with the planned Dulles Corridor Rapid Transit Project improvements in this area. Depending on the final alignment and timing of proposed improvements, it is anticipated that any further study of Beltway rail will take into account the results and design of the Dulles Corridor Rapid Transit Project. See **Figure 1.3-1** to view the intermodal connection between projects.

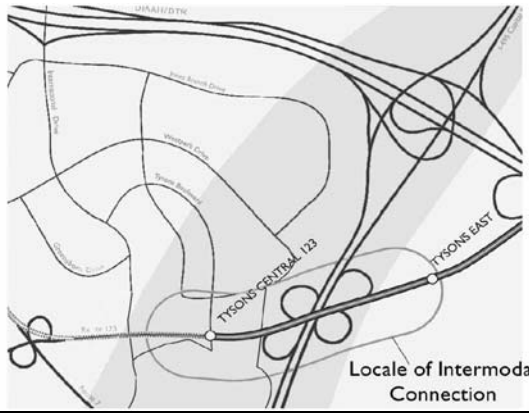

Figure 1.3-1
Capital Beltway Corridor Interface

Study/Plan	Description and Recommendations	Relationship to Project
I-66 EIS (Outside the Capital Beltway), VDOT/DRPT (ongoing)	MIS for I-66 corridor west of the Capital Beltway (completed January 1999). Recommendations included extension of the Metrorail Orange Line from Vienna to Centreville, improvements in bus and Virginia Rail Express (VRE) commuter rail service, and the addition of general purpose and High Occupancy Vehicle (HOV) lanes to I-66. Draft EIS was initiated in Fall 2001. Study team evaluated transportation conditions and developed initial concepts. The study was put on hold indefinitely in early 2003.	Any improvements examined in the I-66 EIS (if implemented) will have an effect on travel patterns and transit demand in the Dulles Corridor. Any future EIS activities will be coordinated with the Dulles Corridor Rapid Transit Project.
I-66 Feasibility Study (Inside the Beltway)	The Virginia Department of Transportation (VDOT) is cooperation with the Virginia Division of the Federal Highway Administration, has undertaken a review of I-66 westbound, between Rosslyn and the Dulles Airport Access Highway. The study was initiated in July 2004 and is scheduled to be completed by early 2005. Concepts to be studied, at a minimum, will include transit, roadway widening, High Occupancy Vehicle/High Occupancy Toll Lanes, as well as a No Build option.	Any improvements examined in the I-66 study (if implemented) will have an effect on travel patterns and transit demand in the Dulles Corridor. Future study activities will be coordinated with the Dulles Corridor Rapid Transit Project.
Metropolitan Washington Airports Authority (MWAA) Capital Improvement Program-Landside (2001-2011)	The $2.6 billion 10-year CIP includes projects designed to enhance the safety, security, and capacity of the Dulles International Airport. Among the improvements are widening and expansion of several roadways providing access to the airport including the DIAAH.	Improvements to the DIAAH, which would widen the facility from 4 lanes to 6 lanes, could require realignment of the Dulles Toll Road at the Herndon-Monroe and Route 28 stations. The design of the Dulles Corridor Rapid Transit Project will be coordinated with the MWAA design of the DIAAH widening.
Metropolitan Washington Airports Authority (MWAA) Capital Improvement Program-Airside (2001-2011)	FAA in association with MWAA is exploring ways that Dulles Airport can meet the projected demands for air transportation while minimizing impact on the environment through the construction of two new air carrier runways. This study, and preparation of the EIS, will take approximately three years and will include gathering public opinion, defining alternative solutions, and studying environmental and community impacts. A final public hearing is scheduled for the Fall 2004.	The runway approach zone of the proposed north-south runway is in proximity to the project's S&I Yard 15 on airport property.

1.3.4 ENVIRONMENTAL REVIEW AND PROJECT DEVELOPMENT PROCESS

The Dulles Corridor Rapid Transit Project is identified in the *Transportation Equity Act for the 21st Century* (TEA-21) as one of the candidate projects to receive federal funding from FTA. Under the *National Environmental Policy Act of 1969* (NEPA), as amended, federal agencies must consider the environmental consequences associated with all alternatives for a project involving federal action. This evaluation of environmental consequences is required to assist decision-makers and the public in evaluating the relative merits of the project (as compared to a No Build Alternative) and in selecting a preferred course of action from the alternatives evaluated.

NEPA requires that federal decision-making include consideration of the potential impacts of a proposed project and its alternatives on the natural and human environment. If substantial environmental impacts are anticipated and cannot be avoided, a plan for mitigating these impacts must be proposed. As part of the decision-making process, reasonable alternatives that would avoid or reduce adverse impacts must

be considered, analyzed, and documented. In addition, the public must be given adequate opportunity to comment on a proposed project, and the project must be coordinated with appropriate agencies.

The level of documentation required for compliance with NEPA varies depending on the class of the proposed action. Class I actions—such as construction of new highway or rail transit facilities, extensions of rail transit facilities, or construction of separate roadways for buses or HOVs—require the preparation of an EIS. An EIS describes in detail how project actions would affect the environment, as well as any proposed mitigation.

1.3.4.1 The Role of the Final EIS

The primary purpose of the Final EIS is to respond to comments and issues raised during the circulation of the Draft EIS and Supplemental Draft EIS and to provide more detailed information on the design of proposed mitigation for unavoidable impacts associated with the project. The information presented in the Final EIS is based on information developed for the Draft EIS and Supplemental Draft EIS and on numerous preliminary technical studies, and reflects comments or suggestions received in the course of public review and agency coordination activities conducted during the evaluation of alternatives.

This Final EIS presents responses to comments received on the Draft EIS and Supplemental Draft EIS and documents any additional analysis required by the comments on the selected LPA. The document will be circulated for agency review, then FTA, as the lead federal agency, will document the completion of the NEPA environmental review process for the project in a Record of Decision (ROD). The Record of Decision will identify the action to be undertaken, environmental findings resulting from the proposed action, and mitigation commitments associated with project implementation.

In addition to FTA, the Federal Aviation Administration (FAA) has been invited and has agreed to participate as a cooperating agency in the Project's NEPA review. A cooperating agency is an agency that has jurisdiction by law or special expertise regarding potential environmental impacts resulting from a proposed action. The FAA is participating as a cooperating agency because construction of project elements on airport property will require a revision to the Airport Layout Plan (ALP) for Washington Dulles International Airport and the use of airport property. An ALP is a planning document used by the FAA to identify proposed new runways, runway extensions, terminal buildings, and other major developments on airport property. A change to an approved ALP and transfer of airport property are considered a Federal action that requires FAA environmental review under NEPA.

The FAA will use this Final EIS to satisfy its NEPA responsibilities, including its approval of project elements shown on the March 2004 revision of the ALP for Washington Dulles International Airport, and its concurrence that it meets the environmental review requirements specified in FAA's Airport Environmental Handbook (Order 5050.4A).

The project elements include the project's alignment, station, ancillary facilities, and S&I yard located on airport property. These project elements have been shown on the ALP since February 2003, pending completion of the NEPA environmental review process.

Following completion of FTA's Record of Decision (ROD) on the project, the FAA will issue its own ROD based on the findings of this Final EIS. The FTA ROD signifies Federal environmental approval to construct the project itself, while the FAA ROD documents FAA's environmental approval of project-related changes to the ALP. FAA's provisions for any conveyance of airport land related to the project will also be addressed in its ROD. Together, the two RODs will document the project's compliance with

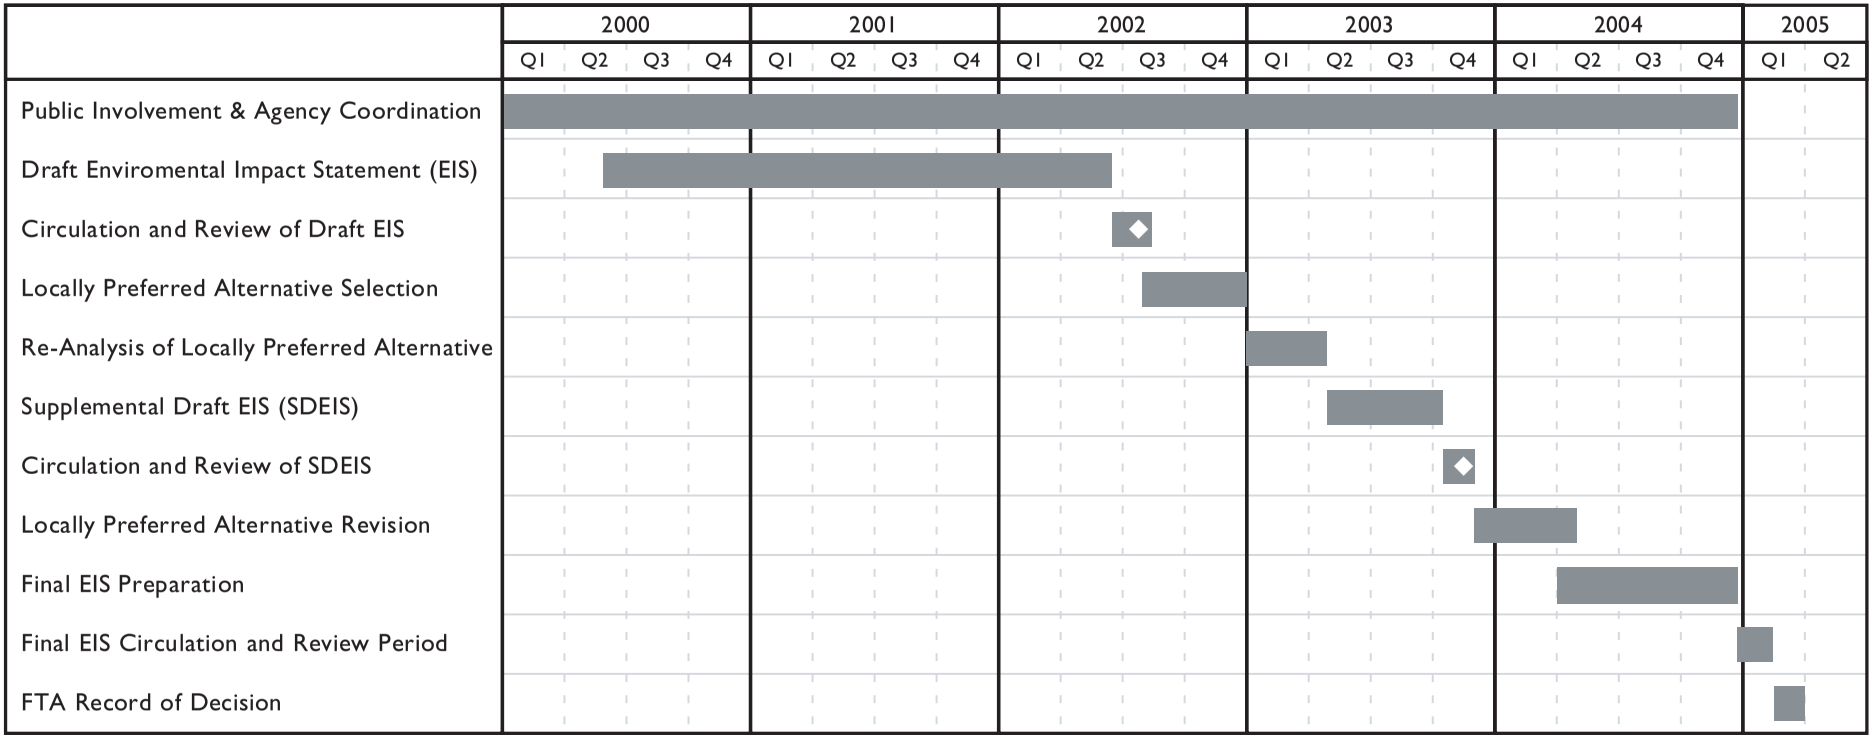
NEPA and outline any required mitigation measures. The overall environmental review process and schedule are shown in Figure 1.3-2.

1.3.4.2 Decision-Making Bodies and Required Approvals

Several local deliberative bodies are responsible for making decisions during the preliminary engineering and environmental review phase of project development. The CTB, a 17-member board appointed by the Governor of Virginia, is primarily responsible for locating routes, approving construction contracts, creating traffic regulations, naming highways, and administering and allocating transportation funds in Virginia. The CTB's role on the Dulles Corridor Rapid Transit Project is to select the LPA, as appropriate, prior to the issuance of the Records of Decision by FTA and FAA. Selection is in cooperation with state, regional, and local jurisdictions and agencies. At its December 19, 2002 meeting, the CTB selected the Metrorail Alternative, with Alignment T6 in Tysons Corner and with a S&I yard at Site 15, as the Locally Preferred Alternative based on the information contained within the Draft EIS. On March 18, 2004 the CTB approved the revision of the LPA to incorporate the elements required for phased construction and the design refinements as outlined in the Supplemental Draft EIS and recommended in the Public Hearings Report.

The WMATA Board of Directors is a six-member board consisting, in part, of two principal Directors from each signatory jurisdiction (Virginia, Maryland, and the District of Columbia). In addition, the Board includes six alternate Directors who may act in the absence of the Principal Director. The WMATA Board is responsible for the mass transit plan for the Washington Metropolitan Area Transit Zone, which includes the Dulles Corridor. Concurrent with the CTB's actions, the WMATA Board of Directors selected and revised the same LPA and amended the Adopted Regional System for Metrorail.

The Metropolitan Washington Airports Authority (MWAA) Board of Directors is a 12-member board whose mission is to direct the development and operation of Ronald Reagan Washington National Airport and Washington Dulles International Airport. In addition to Dulles Airport proper, MWAA operates the DIAAH under a long-term lease from the federal government. Use of the airport roadways and land will require approval of the MWAA Board of Directors and FAA. On November 6, 2002, the MWAA Board voted in favor of a Metrorail Alternative as the Locally Preferred Alternative.



1.3.4.3 Public Involvement

A comprehensive public involvement program has been implemented throughout planning and project development and the environmental review process to support decision-making. A summary of the public involvement process, including agency coordination to date, is included in Chapter 11.

1.4 DESCRIPTION OF THE REGION AND CORRIDOR

From a small collection of communities along the Potomac River, the Washington metropolitan region has grown to an internationally prominent region of more than 4 million people and 2 million jobs. The region has a diversified employment base, with the second-highest concentration of information technology firms in the United States. The region continues to experience growth with a population increase in the last decade of more than 8.5 percent, including more than 350,000 immigrants.

Much of the region's growth is occurring along suburban corridors in Maryland and Northern Virginia. One of the most important and rapidly developing areas in Northern Virginia is the Dulles Corridor, which is characterized by a variety of residential communities, office complexes, retail centers, and a mix of educational, recreational, and leisure facilities.

1.4.1 REGION AND CORRIDOR BOUNDARIES

For the purposes of discussion in this Final EIS, the "region" is defined as the District of Columbia; the Virginia jurisdictions of Arlington County, City of Alexandria, Fairfax County, City of Fairfax, City of Falls Church, Loudoun County, Prince William County, City of Manassas, City of Manassas Park, and Stafford County; and the Maryland jurisdictions of Calvert County, Charles County, Frederick County, Montgomery County, and Prince George's County (see Figure 1.4-1).

Northern Virginia forms the western portion of the Washington metropolitan region (see Figure 1.4-1). The Northern Virginia Transportation Coordinating Council defines Northern Virginia as the jurisdictions of Arlington, Fairfax, Loudoun, and Prince William Counties; the independent cities of Alexandria, Fairfax, Falls Church, Manassas, and Manassas Park; and the towns of Dumfries, Herndon, Leesburg, and Vienna.

The Dulles Corridor is located in Northern Virginia, and is defined as the east-west corridor extending from the vicinity of the West Falls Church Metrorail Station in Fairfax County to Route 772 in eastern Loudoun County. The 23-mile corridor is primarily located in the northern part of Fairfax County. Together, the Dulles Connector Road, DIAAH, Dulles Toll Road, and the Dulles Greenway serve as the corridor's central axis.

1.4.2 CORRIDOR ACTIVITY CENTERS

Several major activity centers are located throughout the Dulles Corridor (see Figure 1.4-2). These activity centers include major employment and commercial centers surrounded by low- to medium-density residential development, as well as tourist destinations and educational facilities.

1.4.2.1 Falls Church

The City of Falls Church is located nine miles west of Washington, D.C. and has well-established residential, shopping, and office developments. The Northern Virginia campuses of the University of Virginia and the Virginia Polytechnic Institute (Virginia Tech) Graduate Center are located near the West Falls Church Metrorail Station. Currently, the East Falls Church and West Falls Church stations on the Metrorail Orange Line provide transit access from Falls Church to the core of the region. However, transit access to the Dulles Corridor is limited to express and local bus service, mostly from the West Falls Church Station.

1.4.2.2 Tysons Corner

Tysons Corner, the "downtown" of Fairfax County, lies adjacent to the Capital Beltway (I-495) between the Dulles Toll Road and Leesburg Pike (Route 7). Today, Tysons Corner is larger, in both geographic size and employment, than many of the central business districts in major U.S. cities, and is one of the largest suburban business districts in the country. Approximately 87,000 people work and 26,000 people live in approximately 3 square miles at Tysons Corner. By 2025, Tysons Corner is projected to provide nearly 124,000 jobs and grow to 30,000 residents.

More than 41 million square feet of commercial and retail space has been developed in Tysons Corner. With Tysons Corner Center and Tysons Galleria as its centerpieces, Tysons Corner has emerged as a regional shopping center. These shopping complexes house more than 350 stores and 5.1 million square

feet of retail space, attracting 1.9 million visitors annually. Currently more than eight million square feet of new development is under construction or in the planning phase in the core of Tysons Corner.

1.4.2.3 Reston, Herndon, and Dulles Corner

The planned community of Reston is located in northwestern Fairfax County, five miles east of Dulles Airport. Reston encompasses 7,400 acres, and in 2000 had a population of more than 63,000 people. Commercial facilities are clustered along three main arteries—Reston Parkway, Sunrise Valley Drive, and Sunset Hills Road—all with easy access to the Dulles Toll Road. While Reston Parkway is a north-south road, Sunrise Valley Drive and Sunset Hills Road run parallel to the Dulles Toll Road, roughly between Hunter Mill Road and the Fairfax County Parkway.

Within the Dulles Corridor, Reston has emerged as a center for high-technology firms and residential development. The area has the second largest amount of office development in Fairfax County (Tysons Corner has the largest), and Reston Town Center has more than 50 shops and restaurants, a multiplex theater, an outdoor ice rink, a 514-room hotel, and almost 1 million square feet of office space. Additional high-intensity development is planned for the Town Center, including a significant increase in residential uses, much of which is currently under construction.

The Town of Herndon is located in northwestern Fairfax County, three miles east of Dulles Airport, and occupies 2,337 acres. Herndon has experienced increased growth in the last decade, and has maintained a balance of commercial, residential, and recreational components. Growth is projected to continue, with a build-out potential for Herndon commercial properties in excess of 30 million square feet of floor space.

Dulles Corner is an emerging activity center located at the interchange of the Dulles Toll Road and Route 28. New developments planned for the area include Dulles Station, a mixed-use development project located on 63 acres directly south of the Toll Road and east of Route 28. Fairfax County approved Dulles Station for transit-oriented development consisting of 1.5 million square feet of office space and 1.2 million square feet of space for multi-family residential use. The development will be centered on a planned transit parking area. In addition, more than nine million square feet of non-residential development is planned for Dulles Corner as part of the Dulles Suburban Center, which is identified in the adopted Comprehensive Plan for the area.

The Reston, Herndon, and Dulles Corner areas of Fairfax County are projected to grow to more than 119,000 residents and to provide 106,000 jobs by 2025. While many Herndon and Reston residents work in this growing technology hub, most still commute daily to other areas of the region, such as southern Fairfax County and the regional core (downtown Washington, D.C. and eastern Arlington, Virginia communities such as Rosslyn). In addition, many of the Reston-based businesses draw their employees from southern Fairfax County and the outer Northern Virginia suburbs.

1.4.2.4 Dulles Airport

Dulles Airport is an 11,000-acre, full-service, international airport with more than 370,000 annual domestic and international flights to accommodate passengers and air cargo. After several decades of steady growth, activity at the airport increased rapidly in the last several years of the twentieth century. From 1995 to 1998, the number of passengers using the airport increased by 28 percent, from 12.5 million to nearly 16 million. In 1999, Dulles was the fastest growing airport in the nation, serving 19.8 million passengers, a 26 percent increase from 1998, and handling 470,000 aircraft operations, a 23 percent increase from the previous year. More than 20 million passengers used the airport in 2000, including

more than 4 million international passengers. According to the MWAA website, the total number of passengers decreased in both 2001 and 2002 following the events of September 11, 2001. However, it is still anticipated that the airport will be able to accommodate 55 million annual passengers and more than 1 million metric tons of international and domestic freight when all planned facilities are built. Dulles Airport currently employs more than 18,800 people, and as airport passenger and cargo operations increase, employment is projected to increase as well.

Dulles Airport has expanded to accommodate the rapid increase in passengers, and more construction is planned in the future. Expansion of the terminal to twice its former size was completed in 1996, and two new concourses were opened in 1998 and 1999. In 2000, the MWAA launched a six-year, $2.6 billion capital construction program. The program includes construction of an underground people mover between the main terminal and concourses, additional public parking, a new concourse, and two new runways. At full build-out, Dulles will be able to handle 55 million passengers per year (150,000 per day).

The Smithsonian Institution's National Air and Space Museum Steven F. Udvar-Hazy Center is located on the south end of the airport property. The museum, which opened in December 2003, is a 700,000-square-foot facility on a 176-acre site. The Institution estimates that three million people will visit the museum annually. This number is projected to increase to five million annual visitors within a few years.

1.4.2.5 Eastern Loudoun County

Over the past ten years Loudoun County, in the westernmost portion of the Dulles Corridor, has experienced substantial growth spurred by the high-tech industry. America Online/Time Warner, MCI, and Orbital Sciences have added a total of 7,350 jobs to the eastern portion of the county. Nearly 50 percent of these jobs are located in Ashburn, home to the MCI campus. The campus is currently in the second phase of development and employs 3,300 people.

Most of the commercial development in Loudoun County is focused along Route 28, between Dulles Airport and Route 7. Due to its proximity to the airport, this area also includes a large amount of industrial development. In total, eastern Loudoun County is planned to include 9.2 million square feet of industrial space. There are a number of industrial parks to the north of Route 606 and the airport, the largest of which is the Beaumeade Corporate Park. This industrial park has more than 1.8 million square feet of office and industrial development already in place and is approved for a total of 3.5 million square feet in the future. A number of smaller office and industrial developments (existing and planned) are located closer to Route 606.

In addition to job growth, Loudoun County has been experiencing extensive population growth. Between 1990 and 1999, the county's population grew at a rate of roughly seven percent per year, making it the fastest-growing county in Virginia and one of the fastest growing counties in the nation. Much of this residential growth has occurred north of the Dulles Greenway and west of the Route 28 corridor.

Future development is planned for the residential communities of Ashburn Village and Ashburn Farm, which will have more than 9,000 homes and nearly 23,000 residents when completed. Other planned residential developments, which will include a mix of land uses, are Belmont, Broadlands, and Brambleton. Together these communities will include more than 11,000 homes, as well as substantial office and retail development. Much of this future development will be concentrated along the Dulles Greenway, west of the Route 28 corridor. In addition, two adjacent mixed-use developments, Loudoun

Station (awaiting site plan approval) and Moorefield Station, are planned for the areas north and south of the Route 772/Dulles Greenway interchange, near the proposed Route 772 Station.

1.4.3 CORRIDOR TRANSPORTATION SYSTEM

The transportation system in the corridor includes the existing roadway and transit networks. The diverse roadway network ranges from limited access highways to local streets. The transit network includes services from several providers, but is primarily limited to bus transit.

1.4.3.1 Roadway Network

The heart of the Dulles Corridor roadway network is the east-west transportation facility formed by the Dulles Connector Road, the DIAAH, the Dulles Toll Road in Fairfax County, and the Dulles Greenway in Loudoun County (see Figure 1.4-2).

The Dulles Connector Road is a four-lane facility that serves traffic using I-66 to and from the east, the Capital Beltway, Route 123, the Dulles Toll Road, and the DIAAH. In the eastbound direction, the shoulder of the Connector Road has been widened and reinforced, and buses are permitted to use it during periods of severe congestion. The Dulles Connector Road is owned by the federal government, leased by MWAA, and operated by Virginia Department of Transportation (VDOT).

The DIAAH is located in the median of the Dulles Toll Road and is reserved for travelers with business at Dulles Airport, including air passengers, air-freight customers, and employees. In peak periods, this roadway also provides access for express buses serving Fairfax County and Dulles Airport. The DIAAH is owned by the federal government, but is operated by MWAA under a long-term lease agreement with FAA.

The Dulles Toll Road is an eight-lane toll facility that provides direct access between the Capital Beltway, eastern Loudoun County, and various activity centers in between. The Dulles Toll Road is operated by VDOT.

The Dulles Greenway is a four- and six-lane privately owned toll facility that connects to the Dulles Toll Road at Route 28 and extends to the Route 7 Bypass east of Leesburg. Together, the Toll Road and the Greenway form Route 267.

Other regionally essential roadways include Interstate 66 (I-66), Interstate 495 (I-495, Capital Beltway), Route 7 (Leesburg Pike), Route 123 (Chain Bridge Road/Dolley Madison Boulevard), Route 193 (Georgetown Pike), Route 7100 (Fairfax County Parkway), Route 28 (Sully Road), Route 50 (Lee-Jackson Memorial Highway), and the Loudoun County Parkway. Route 7 and Route 193 form the northern boundary of the corridor, while I-66 and Route 50 form the southern boundary. These roadways are primarily oriented east-west. I-495, Route 123, Route 7100, and Route 28 provide north-south passage through the corridor, connecting to its northern and southern boundaries, and, in most cases, extending beyond the corridor.

With the exception of Route 193 and portions of the Loudoun County Parkway, which have two lanes in some locations, these regional roadways are limited-access freeways or arterial routes with at least four lanes. Portions of I-66, Route 7, Route 123, Route 50, and Loudoun County Parkway have six lanes, and Route 28 has six lanes throughout. I-495 is an eight-lane facility. Segments of several of these regional roadways are planned for expansion within the next ten years.

Other key roadways in the corridor that provide access to the DIAAH, the Dulles Toll Road, and the Greenway include Hunter Mill Road, Wiehle Avenue, Reston Parkway, Centreville Road, and Route 606. These roads primarily serve local travelers in north and central Fairfax County and eastern Loudoun County. Hunter Mill Road provides north-south access through most of the corridor, roughly extending between Route 7 in the north and I-66 in the south. Similarly, Reston Parkway allows north-south travel through the corridor, extending between Route 7 and the southern portion of Reston, where it briefly becomes Lawyers Road, then merges into Route 608 (West Ox Road), and eventually connects to Route 50 at the southern end of the corridor. Centreville Road and Route 606 serve travel in the vicinity of Dulles Airport, extending between the Town of Herndon and Route 50. Centreville Road serves travelers on the east side of the airport, whereas Route 606 runs along the northern and western edges of the airport.

Two other roadways of note are Sunset Hills Road and Sunrise Valley Drive. These collector roadways parallel the Dulles Toll Road, and provide access to neighborhoods and office complexes bordering the Toll Road. To some extent, Sunset Hills Road and Sunrise Valley Drive are alternative routes to the Toll Road through Reston.

1.4.3.2 Transit Network

Existing transit services within the Dulles Corridor include Metrorail and Metrobus operated by WMATA, express and local buses provided by Fairfax County, express and local buses provided by Loudoun County, and Washington Flyer buses provided by MWAA. These transit services are integrated with transit centers and park-and-ride lots throughout the corridor.

A. WMATA

WMATA is the Washington, D.C. metropolitan region's primary public transportation provider. Created in 1967 through a congressionally approved interstate compact, WMATA is the public agency responsible for planning, developing, constructing, and operating the regional rail, bus and paratransit systems. The agency now operates a multi-branch network stretching nearly 1,500 square miles of the District of Columbia, Arlington County, Fairfax County, the City of Alexandria, and the City of Fairfax in Virginia; and Montgomery and Prince George's counties in Maryland—an area encompassing approximately 3.2 million residents.

Metrorail is the rapid rail component of WMATA's public transportation system (see Figure 1.4-3). With 103 miles of track and 83 stations, the Metrorail system connects major activity centers within the region's urban core to those within and beyond the Capital Beltway. The system also links to the two regional commuter rail systems: Virginia Rail Express (VRE) and the Maryland Rail Commuter (MARC) service. In 2004, the Metrorail system carries approximately 650,000 weekday passengers. The Metrorail Orange Line serves the southeastern portion of the Dulles Corridor, with stations at East Falls Church, West Falls Church, Dunn Loring, and Vienna (see Figure 1.4-3). These stations primarily serve travel to and from the region's core, and do not adequately serve travel within the Dulles Corridor.

Metrobus, WMATA's regional bus system, operates 322 routes. Systemwide, Metrobus carries 510,000 daily passengers in 2004. Currently, 14 Metrobus routes operate in the Dulles Corridor, primarily providing service between Tysons Corner, the corridor Metrorail stations, and areas to the south and east. Several of the routes also provide feeder service to the Ballston and Rosslyn Metrorail stations in Arlington. One route provides express service between downtown Washington, D.C. and Dulles Airport, with stops at the Tysons-West Park Transit Station and the Herndon-Monroe Park-and-Ride, and another provides express service between downtown and Tysons Corner Center. Though some routes operate

with 20- or 60-minute headways, most operate with 30-minute headways during the peak period. Many corridor buses are frequently delayed by heavy traffic congestion in Tysons Corner and elsewhere in the region.

B. Fairfax County

Fairfax County provides public transportation via the Fairfax Connector bus system. The system includes 54 regular routes operating throughout the county, some of which provide connections to Falls Church, Arlington, and Alexandria. The Fairfax Connector service also includes four Reston Internal Bus Service (RIBS) routes, which provide circulator service within the Reston-Herndon area. Fairfax Connector had 27,800 average weekday boardings systemwide in 2004.

The Dulles Corridor is served by 28 of the Fairfax Connector routes. This service includes Express Bus Service operating in the DIAAH and Dulles Toll Road, RIBS circulator service in Reston-Herndon, and circulator services operating within Tysons Corner. In general, peak service frequencies range from 15 minutes to 30 minutes. In 2003, Fairfax Connector ridership in the corridor was on average approximately 13,800 weekday passengers.

C. Loudoun County

Currently, Loudoun County contracts to provide 16 peak-period express bus trips from the eastern part of the county to Rosslyn, the Pentagon, the State Department, and other locations in downtown Washington, D.C. The County also provides reverse-peak express trips from West Falls Church Metrorail Station to Dulles North Transit Center and the AOL/MCI campuses in the county (one trip in the a.m. peak, two trips in the p.m. peak). Recently, the County began offering local circulator services along Route 7, in the Sterling and Purcellville areas, and between Dulles Town Center and Dulles Airport. A major hub for the County's express and local service is the 750-space Dulles North Transit Center at the north end of Dulles Airport near the Route 606/Dulles Greenway interchange. In 2004, Loudoun County's Express Bus Service serves about 1,700 average weekday passengers.

D. Transit Centers

An important element of the existing Dulles Corridor transit service is the network of bus transit centers and park-and-ride lots. Overall, there are ten bus transit facilities in the corridor, including the Dulles North Transit Center, the Herndon-Monroe Park-and-Ride lot in Herndon, 3 park-and-ride lots in Reston (Reston South, Reston East, and Reston North), and the Tysons-West Park Transit Station in Tysons Corner, among others. Most of these transit centers provide short-term parking or Kiss & Ride spaces for passengers being dropped off or picked up, and seven centers also provide all-day parking for commuters. Commuter parking is in heavy demand at the eastern end of the corridor. As a result, the parking facilities at the East Falls Church and West Falls Church Metrorail stations, and at the Reston East Park-and-Ride near the Wiehle Avenue/Dulles Toll Road interchange are generally full on an average weekday.

1.4.4 TRAVEL PATTERNS

Historically, the largest segment of travel in the Washington metropolitan region consisted of work travel between suburban homes and jobs in the urban core, and discretionary trips within suburban residential areas. However, continuing growth in employment and retail development in the Maryland and Northern Virginia suburbs shows the changing patterns in which people commute, shop, and travel. Regional travel currently includes a growing number of suburb-to-suburb work trips, core-to-suburb work trips, and discretionary trips to regional entertainment and shopping centers in the suburbs.

As one of the major suburban employment and retail centers in the region, the Dulles Corridor attracts work trips from residences in the core and other suburban areas, as well as shopping and entertainment trips to venues such as Tysons Corner Center, Tysons Galleria, and Wolf Trap National Park. Corridor travel also includes traditional trips from residences in the corridor to jobs in the urban core, trips to work centers in other suburban areas, and discretionary trips from residences to nearby shopping and services.

Though corridor-related trips are projected to increase from 2.2 million to 3.2 million trips per day by 2025, only minor changes in travel patterns are expected within the corridor, because most of the employment and population growth in the corridor is planned for existing and emerging activity centers. The existing and expected patterns for corridor-related travel are summarized in Tables 1.4-1 to 1.4-3. These tables do not present information on travel to and from various areas within the corridor; rather, travel patterns are shown for the corridor as a whole.

Table 1.4-1: Total Weekday Corridor-Related Travel

Movement	2000		2025	
	Corridor Related Trips	Percent of Total	Corridor Related Trips	Percent of Total
Within Corridor	870,000	40%	1,300,000	40%

1.4.4.1 Overall Travel

The majority of travel in the Dulles Corridor is between points within the corridor or between the corridor and other parts of Northern Virginia. According to estimates prepared by the project team, based on MWCOG projections of population and employment, approximately 40 percent of all corridor-related travel in 2000 was between homes and activity centers within the corridor. An additional 30 percent of corridor-related travel was between the corridor and the southern portions of Fairfax County, and approximately 13 percent was from the outer Virginia suburbs (including western Loudoun, Prince William, Fauquier, and Stafford Counties, and other outlying jurisdictions) to the corridor. Approximately ten percent of corridor-related trips are to and from Arlington County and the regional core, while the remaining seven percent of trips are to and from the Maryland suburbs and Washington, D.C.

In the next 25 years, these patterns are expected to change very little, though the number of trips is expected to increase considerably, especially between the corridor and the outer Virginia suburbs. Travel within the corridor is projected to remain the largest share of corridor-related travel. The next largest share of corridor-related travel is expected to be to and from other parts of Northern Virginia, though the percentage of trips to other parts of Fairfax County is expected to decrease to 26 percent, while the share of trips to and from the outer Virginia suburbs is expected to increase to 18 percent.

Travel to and from the Dulles Corridor is currently spread fairly evenly among the various activity centers. Vienna and the southern parts of the corridor produce a slightly larger share of trips due to the greater concentration of residential developments in these areas. Trips go to and come from all parts of the corridor and the region, but most trips in the corridor begin and end within one activity center or involve travel between neighboring activity centers.

Dulles Airport draws travelers from the entire region, including air passengers, airport employees, and freight carriers. Based on 1998 MWAA traffic counts, approximately 60 percent of the airport traffic uses the DIAAH, and 40 percent of travelers access the airport via Route 28. As the overall number of trips to the airport vicinity increases, the share of traffic coming from the Route 28 corridor is also expected to increase.

1.4.4.2 Work Travel

A key component of the overall travel patterns for the Dulles Corridor is work travel. Work trips most directly influence the effectiveness of the transportation system, because they tend to be limited to the morning and evening peak periods, resulting in the maximum traffic volumes experienced by the system.

For current corridor-related work travel, the largest movements are between the corridor and the southern portions of Fairfax County (30 percent) and between residences and jobs within the corridor (24 percent). Nearly 60 percent of the trips between the corridor and southern Fairfax County are from residences in the county to jobs in the corridor; corridor residents who work in the county make up the remaining 40 percent. Approximately 18 percent of corridor-related work travel consists of trips between the outer Virginia suburbs and the corridor; most of these trips are from residences in the outlying areas to jobs in the corridor. Corridor residents who are employed in western Arlington and the regional core make up another 14 percent of corridor-related work trips, and the remaining 13 percent are between the corridor and the Maryland suburbs and non-core portions of Washington, D.C.

By 2025, it is expected that corridor-related work travel patterns would shift slightly. Jobs within the corridor are expected to attract an increasing share of corridor residents and residents of the outer Virginia suburbs. At the same time, the share of work trips between the corridor and other portions of Fairfax County is expected to decrease. Likewise, it is anticipated that the share of corridor residents attracted to jobs in the region's core would decrease.

In 2000, nearly 30 percent of all the work trips attracted to the Dulles Corridor went to Tysons Corner. The remaining trips were distributed uniformly between employment centers in Reston, Herndon, Dulles Airport, eastern Loudoun County, and the southern portion of the corridor near Vienna. By 2025, the anticipated growth in eastern Loudoun County is expected to cause a shift in the distribution of work travel within the corridor. The largest share of corridor work trips (28 percent) is expected to go to eastern Loudoun County and the Tysons Corner share of the market would decrease to 25 percent, though the absolute number of trips to both places are expected to increase substantially (from 45,000 to 132,000 daily trips in Loudoun County, and from 85,000 to 118,000 daily trips in Tysons Corner). Reston and Vienna are also expected to attract a smaller share of corridor work trips. The majority of the eastern Loudoun County employees are expected to live in that portion of the corridor or in the outer Virginia suburbs.

1.4.4.3 Work Travel by Transit

Currently, few corridor residents and employees use transit to travel to work. Based on estimates prepared using the Northern Virginia Major Investment Study Model (NVMISM) and the recent MWCOG population and employment forecasts, only 12 percent (30,000 trips) of the work trips beginning in the corridor are made using transit, and an even smaller percentage of travelers commuting to jobs in the corridor use transit (5 percent or 10,000 trips).

Corridor residents who work in western Arlington and the region's core are far more likely to use transit for their commute than other travelers in the Dulles Corridor. For work travel, residents of the Dulles Corridor who work in western Arlington and the core make 60 percent of all corridor-related transit travel. The next largest share of this travel market are work transit trips between the corridor and southern Fairfax County (15 percent), most of which are made by county residents who work in the corridor. Corridor residents who also work in the corridor make up an additional ten percent of work transit trips. This pattern is not expected to change considerably by 2025, in the absence of the proposed project.

About 53 percent of the corridor-related work transit trips are associated with the West Falls Church and Vienna areas, most likely due to the presence of Metrorail. Most of these trips are made by residents of these areas, rather than by employees. Approximately 23 percent of corridor-related work transit trips are to and from Tysons Corner; however, employees of Tysons Corner rather than residents mostly make

these trips. Residents in the Reston area generate an additional 11 percent of work transit trips in the corridor.

For the baseline condition in 2025, the overall number of work trips made by transit is expected to increase by close to 20,000 trips per day, but the patterns of transit travel are not expected to change substantially. Only 47 percent of the corridor-related work transit trips in 2025 are anticipated to be either to or from West Falls Church and Vienna, whereas Reston transit trips are expected to increase to 14 percent. The share of work transit trips bound for Tysons Corner is not expected to change in 2025.

1.5 NEED FOR IMPROVEMENTS

The transportation needs of the Dulles Corridor have been documented previously in numerous studies and plans (see Section 1.3). The analyses conducted for these studies focused on several interrelated elements.

- **Anticipated Population and Employment Growth.** Growth in the Dulles Corridor is expected to continue at higher rates than the region as a whole.
- **Future Land Use and Development Plans.** Local land use plans call for higher-intensity office, retail, and residential development at existing activity centers in the corridor, and allow for concentrated development on parcels at the emerging activity centers in Dulles Corner and eastern Loudoun County.
- **Increased Travel Demand.** More residents and more job opportunities, when combined with expected increases in passenger and freight operations at Dulles Airport, will result in higher travel demand on highways and streets in the Dulles Corridor and throughout the region.
- **Limitations of the Existing and Planned Roadway System.** Existing travel demand is straining the roadway system to its capacity, resulting in moderate to severe congestion throughout the Dulles Corridor. Despite planned capacity improvements for various corridor roadways, the future highway system will be unable to meet the anticipated increases in travel demand. However, with a limited amount of remaining right-of-way, the corridor will be unable to support further roadway capacity enhancements.
- **Limitations of the Existing Transit System.** Many existing transit services are a poor alternative to auto travel, because they are also affected by increasing roadway congestion and many services have higher travel times between key origins and destinations than travel by private auto. In the future, transit services that continue to operate on congested roadways will not effectively serve growth in travel demand.
- **Air Quality.** The inability to serve the anticipated demand will cause substantial deterioration in highway and transit operations in the Dulles Corridor, contributing to increased air quality problems in the Washington metropolitan region.

The combined effect of these elements creates a need for improved transportation alternatives and connections in the Dulles Corridor.

1.5.1 ANTICIPATED POPULATION AND EMPLOYMENT GROWTH

MWCOG expects that population and employment in the Dulles Corridor will increase more rapidly than the metropolitan regional averages. Analysis of MWCOG's Cooperative Forecast Data on population, employment, and household growth shows that by 2025, the corridor will experience a 63 percent increase in jobs, compared to an average increase of 41 percent throughout the region. Likewise,

population in the corridor is expected to increase 45 percent between 2000 and 2025, compared to 32 percent population growth in the region. MWAA projects that Dulles Airport will experience considerable increases in air travel patronage, air cargo operations, and employment. Growth in passenger use alone is projected to reach 55 million trips by 2035—more than twice the current level.

Given these projected levels of growth, improving corridor mobility and creating better intermodal connections will be key factors in meeting the transportation needs of residents and employees in the corridor, as well as the needs of increasing numbers of visitors to the region.

1.5.1.1 Population

Growth statistics for the Washington metropolitan region indicate that current and anticipated growth in suburban population centers far outpaces residential growth in the region's core, especially for centers in Northern Virginia. According to MWCOG and U.S. Census data, in 1960 Washington, D.C. was the region's largest population center with 764,000 residents, and Fairfax County was the region's fourth largest jurisdiction with 275,000 residents. By 2000 the two jurisdictions had switched places: Fairfax was the largest jurisdiction in the region, with almost 970,000 residents, compared to Washington, D.C.'s 572,000 residents according to census data. The latest MWCOG forecasts indicate that this growth trend is expected to continue, with Fairfax County population totals reaching about 1.2 million residents. This total exceeds not only Washington, D.C.'s projected total (666,000 residents), but also the total for Washington, D.C., Arlington County, and the City of Alexandria combined (1 million residents). Moreover, in this same time frame, the outer suburbs in Northern Virginia are expected to grow at a substantial rate. In Loudoun County alone, the population is expected to increase 150 percent from about 169,000 people to over 422,000 people.

Growth trends in Fairfax County and Loudoun County are reflected in the anticipated growth for the Dulles Corridor. As shown in Table 1.5-1, the regional population is expected to increase from nearly 4.5 million residents to around 5.9 million residents by 2025, an increase of about 32 percent. At the same time, the population in the Dulles Corridor is expected to grow by about 45 percent, from approximately 370,000 residents to about 540,000 residents.

Table 1.5-1: Population within the Region and the Dulles Corridor

	2000	2005	2010	2015	2025
Region					
Population	4,458,797	4,877,851	5,208,832	5,507,071	5,887,286
Persons/Acre	1.60	1.75	1.87	1.98	2.12
Corridor					
Population	371,578	425,295	469,787	500,716	539,294
Persons/Acre	3.23	3.70	4.09	4.36	4.69

Source: MWCOG, Round 6.3 Cooperative Forecasts

The bulk of the population growth in Fairfax County will be concentrated around Tysons Corner, Reston, and Herndon, with densities reaching greater than ten persons per acre. In the Loudoun County portion of the corridor growth is projected to occur primarily in the eastern portion of the county, along the Dulles Greenway and Route 28. Here, the number of residents is expected to increase to almost 167,000 from 2000 to 2025. This is an increase of more than 103,000 residents and represents more than 37 percent of all population growth in Loudoun County.

1.5.1.2 Employment

Despite strong employment growth in the Maryland and Northern Virginia suburbs, MWCOG Cooperative Forecasts show that, in 2000, Washington, D.C. had the single largest concentration of employment, with nearly 680,000 jobs. The urban core is expected to remain the largest regional employment center, as it continues to contain the seat of government and the headquarters of most federal agencies. The next largest employment centers were Montgomery County and Fairfax County, with approximately 545,000 jobs and about 573,000 jobs, respectively. Overall, the combined employment totals for the inner suburbs (1.4 million jobs in Montgomery, Prince George's, and Fairfax Counties, and Rockville, City of Falls Church, and City of Fairfax) were greater than those for the three central jurisdictions (about 978,000 jobs in Washington, D.C., Arlington County, and City of Alexandria).

In 2025, Washington, D.C. is expected to remain the region's largest employment center, with an increase of approximately 153,000 jobs. The largest absolute job growth is anticipated in Fairfax and Prince George's counties, with increases of approximately 205,000 jobs and 190,000 jobs, respectively. However, the largest percentage growth in employment, by far, is expected in Loudoun County with a 158 percent increase in jobs. Throughout the region, nearly two thirds of all new jobs are anticipated to be in the service industry, which includes professions related to engineering, computer and data processing, business services, and medical research, among others.

Reflecting the substantial employment increases in Fairfax and Loudoun counties, the Dulles Corridor is projected to have a similar increase in employment between 2000 and 2025. Table 1.5-2 shows that regional employment is forecast to grow by nearly 41 percent between 2000 and 2025—higher than the rate seen for population and household growth. The number of jobs in the Dulles Corridor is projected to increase by roughly 63 percent, adding nearly 185,000 jobs to the corridor.

Table 1.5-2: Employment within the Region and the Dulles Corridor

	2000	2005	2010	2015	2025
Region					
Employment	2,826,210	3,079,949	3,376,883	3,584,716	3,994,729
Jobs/Acre	1.02	1.11	1.21	1.29	1.44
Corridor					
Employment	292,067	339,679	387,332	413,549	477,047
Jobs/Acre	2.54	2.96	3.37	3.60	4.15

Source: MWCOG, Round 6.3 Cooperative Forecasts

The Fairfax County portion of the corridor is expected to have the largest absolute increase in number of jobs, but it is anticipated that the Loudoun County portion of the corridor will have the largest percent increase in employment. According to MWCOG data, it is anticipated that about 83,000 jobs will be added from 2000 to 2025 in the Loudoun County portion of the corridor, resulting in an average density of more than 4 jobs per acre in the employment zones along the Dulles Greenway, and accounting for almost 60 percent of all employment growth in Loudoun County. A major contributor to job growth in Loudoun County is Dulles Airport, which is one of the largest employers in the corridor with more than 18,800 employees. As passenger and cargo operations at Dulles Airport increase, employment is projected to increase to 65,000 employees by 2035.

1.5.2 FUTURE LAND USE AND DEVELOPMENT PLANS

The economic benefits of new development in the Dulles Corridor are influential not only for Fairfax and Loudoun counties, but for the region as a whole. Improved transportation alternatives and connections are needed to keep pace with the increased travel demand and the patterns of travel created by new development. In response to growing population and employment in the corridor, residential development and commercial real estate activity are occurring at a record pace. More than 23 million square feet of development has recently been constructed or approved for development. As noted in Section 1.4, much of this development is occurring in the vicinity of Dulles Airport at the western end of the corridor. Activity centers such as Dulles Corner and eastern Loudoun County are becoming known as technology and communications centers. Rapidly growing high-tech companies and professional service firms are purchasing and developing large amounts of land in these areas, fueling the region's largest commercial construction boom in a decade.

Most of the planned development in the corridor over the next 25 years is slated to occur in the existing and emerging activity centers. Development in Tysons Corner is expected to intensify, including higher-density infill development and redevelopment. Office development will be supported by retail and services, and in some cases will be intermixed with higher-intensity residential development. Undeveloped land in the Reston-Herndon area is planned for additional office, retail, and residential use. In the vicinity of key interchanges along the Dulles Toll Road, existing commercial development could be intensified. The current development activities in Dulles Corner and eastern Loudoun County will continue, including large-scale regional office development, hotels, industrial parks, higher-density residential development, and mixed-use development with office, residential, and retail space.

New development is also planned at Dulles Airport to accommodate the anticipated increases in passenger and cargo service. This development includes a new concourse, a new runway, and additional parking, all of which will increase travel demand in the corridor.

1.5.3 INCREASED TRAVEL DEMAND

Continued growth in the Dulles Corridor will result in noticeably higher travel volumes throughout the corridor and the region. Between 2000 and 2025, it is estimated that regional travel will increase by 29 percent, growing from 18.2 million person trips per day to 23.5 million person trips per day. Similarly, work trips in the region are expected to increase 32 percent, from 3.7 million trips per day to 4.9 million. The highest concentrations of travel growth for the region will occur in the Dulles Corridor and the outer Virginia suburbs, especially for trips to and from eastern Loudoun County. Between 2000 and 2025, the total number of corridor-related trips is expected to increase 45 percent (from 2.2 million trips to 3.2 million), while the total number of trips to and from eastern Loudoun County is projected to increase nearly 188 percent (from 400,000 trips to 1.1 million). Work trips to and from eastern Loudoun County are also expected to increase 191 percent (from 70,000 trips to 204,000). In addition, substantial growth is projected for work trips to Herndon and the northern Route 28 corridor (a 65 percent increase from 61,000 to 100,600 trips).

As discussed in Section 1.4.4, it is anticipated that eastern Loudoun County will attract a larger share of overall corridor-related travel, including an increasing number of trips made by residents from other parts of the corridor (from 50,000 daily trips in 2000 to 103,000 trips in 2025). However, other corridor activity centers will continue to attract and produce large numbers of trips. For example, employment and shopping opportunities in Tysons Corner and Reston will continue to attract numerous residents from the

Dulles Corridor, other parts of Fairfax County, and the outer Virginia suburbs (more than 550,000 daily trips). Jobs in the region's core will also continue to attract large numbers of corridor residents (nearly 95,000 residents).

The minor changes in corridor travel patterns, combined with increasing numbers of trips, will result in noticeably higher traffic volumes throughout the Dulles Corridor. Based on VDOT estimates and project team projections, it is expected that between 2000 and 2025, eastbound traffic volumes on the Dulles Toll Road will increase from 6,200 vehicles to 8,200 vehicles in the peak hour between Hunter Mill Road and Reston Parkway (excluding the high-occupancy vehicle lanes). Similarly, peak volumes at specific locations along other major arterials within the corridor are expected to increase substantially. For example, westbound volumes on the Dulles Connector Road are expected to increase from 3,600 to 6,200 vehicles, while eastbound traffic on the Dulles Greenway is expected to grow from 3,300 to 8,100 vehicles and westbound traffic on Route 50 is projected to increase from 5,700 to 8,300 vehicles. Increasing volumes on these regional routes will force more vehicles onto local roads, causing increases in delay at many key intersections throughout the corridor. For example, in Tysons Corner project team estimates indicate substantial increases in delay are likely along Route 7, International Drive, and Westpark Drive. For some of these locations, delay is expected to increase by nearly 300 seconds, indicating considerable growth in the number of vehicles on the roadways (see Chapter 6 for more detailed information on traffic volumes and intersection delay).

1.5.4 LIMITATIONS OF THE EXISTING ROADWAY SYSTEM

For much of the Dulles Corridor transportation network, current traffic volumes meet or exceed the capacity of roadways and intersections, causing severe congestion in the corridor. Typically, the level of congestion on a roadway or at an intersection is reflected by a qualitative measure called level of service (LOS). In general, LOS represents the average delay experienced by vehicles traveling along a road or through an intersection. Six letter designations (A through F) are used to represent different levels of service, with LOS A reflecting free flow conditions and LOS E and F representing very congested or gridlock conditions. Many of the facilities in the Dulles Corridor are currently at LOS E and F, and increasing demand is only expected to worsen conditions.

As part of efforts to ease congestion in the corridor several roadway expansion projects are planned over the next 20 years. Additional lanes are planned for many corridor routes—including the DIAAH, the Dulles Greenway, I-495, Route 7, Route 123, Route 7100, Route 28, and the Loudoun County Parkway. Most of these routes will be widened for much of their length through the corridor. Additional capacity enhancements include interchange improvements for I-66, the Dulles Toll Road, and I-495, and plans to convert the existing at-grade intersections along Route 28 into interchanges. All of these improvements are scheduled to be in place by 2025, and many will be implemented sooner.

Anticipated transportation improvements are not expected to improve overall travel conditions in the corridor. Forecasts for 2025, which take the planned improvements into account, show that I-66, I-495, the Dulles Connector Road, the Dulles Toll Road, and Route 50 are projected to continue to operate at LOS E or F in the peak hour. At the same time, traffic conditions on the DIAAH and the Dulles Greenway are expected to deteriorate (from LOS C to D and LOS D to F, respectively). Likewise, as detailed in Chapter 6, numerous intersections throughout Tysons Corner, Reston, and Herndon are expected to remain at, or worsen to, LOS E and F.

Though the transportation system requires additional capacity to serve the ever-increasing travel demands in the Dulles Corridor, expansions to the roadway network are constrained by limitations of right-of-way and development patterns. The existing and planned development in the corridor restricts the amount of land available for roadway expansion projects. The expansion of the Dulles Toll Road to an eight-lane facility in 1998 used its remaining right-of-way; as a result, adding new traffic lanes to the main east-west route through the Dulles Corridor is no longer viable. Other planned roadway improvements in the corridor will use the majority of the remaining right-of-way. Further roadway expansions would likely have impacts on a substantial number of businesses and residents.

1.5.5 LIMITATIONS OF THE EXISTING TRANSIT SYSTEM

Because the existing transit system in the Dulles Corridor operates on the congested roadways described above, it offers a limited alternative to auto travel. Congestion reduces the reliability of transit services and increases transit travel times because, in addition to traveling in slow-moving traffic, transit vehicles have to stop to pick up and drop off passengers. For travel between several key origins and destinations in the corridor and the region, current transit travel times are approximately 20 to 30 minutes more than those for travel by private auto. As a result, transit in the corridor is not an attractive travel alternative—as reflected by the nine percent transit share of all daily work trips (approximately 40,000 trips)—and does little to effectively serve the existing high levels of travel demand.

Over the next 25 years, the share of daily transit travel is expected to remain relatively low. Though the absolute number of corridor-related daily transit trips is projected to increase by more than 30,000 trips per day, the transit share of daily work trips is expected to remain at nine percent between 2000 and 2025. This share is much lower than the 16 percent transit share experienced region-wide for daily work travel.

Though transit improvements are needed in the corridor, the effectiveness of planned expansions to the corridor transit system—including enhancements to Fairfax County bus service and new Express Bus Service for Loudoun County—would be hampered by increasing roadway congestion. With the exception of several express routes that use the DIAAH, nearly all transit routes in the corridor travel on the same general-use traffic lanes and arterial routes that private vehicles use. As a result, many of the enhanced transit services in the corridor will continue to experience increased travel times and reduced schedule reliability, decreasing their attractiveness as an alternative to auto travel in the corridor and limiting their ability to adequately serve the anticipated growth in travel demand. (For some routes, however, increases in express and local service are expected to reduce wait times, improving overall travel times for these routes by five to ten minutes.)

Consequently, in order for transit to be effective in the corridor, it would need to operate in a separate or restricted right-of-way. Through operation in a dedicated right-of-way, transit service would be able to bypass much of the congestion in the corridor, offering travel time savings and providing a viable alternative to auto travel on congested roadways.

The DIAAH is an underutilized transportation resource in the corridor, with the potential for developing additional capacity in a separate or restricted right-of-way. The roadway extends through most of the corridor, is close to all the key activity centers in the corridor, and has limited access with reasonably free-flowing traffic, which aids the existing Express Bus Service. In addition, the median of the DIAAH has been reserved for the last 35 years for a future transit line and is capable of supporting a rail line.

1.5.6 AIR QUALITY

Current traffic congestion in the Dulles Corridor contributes to air quality problems in the Washington metropolitan region. The region has been designated a severe non-attainment area for ozone, one of the six criteria pollutants monitored by the U.S. Environmental Protection Agency (EPA). A severe non-attainment designation indicates that the measured ozone levels exceed the National Ambient Air Quality Standards (NAAQS) for this pollutant. As a severe non-attainment area, the Washington DC region is required to meet standards defined by the Clean Air Act by November 2005.

To ensure compliance with the NAAQS, each state must develop a State Implementation Plan (SIP) demonstrating that every effort is being made to achieve or maintain attainment status. New programs or projects must be in compliance with this SIP. Because emissions from autos are major components in the formation of ozone, the SIP for Virginia includes transportation control measures to reduce vehicle miles traveled. Reducing vehicle miles traveled should lead to a decrease in emissions and, over time, contribute to the attainment of air quality standards in the region.

Accordingly, there is a need to develop improvements along the Dulles Corridor that would reduce vehicle miles traveled and emissions. The transportation improvements currently planned for the corridor will be unable to effectively serve the anticipated increases in demand and, as a result, congestion and emissions would likely increase. To help attain regional air quality goals, additional transportation improvements in the corridor must be able to move high volumes of travelers while generating low pollutant emissions and reducing vehicle miles traveled.

1.6 GOALS AND OBJECTIVES

The LPA evaluated in this Final EIS was developed to meet a specific set of goals and objectives designed to address the transportation needs of the corridor, as well as the transportation goals of the region. Accordingly, the LPA was assessed to determine how well it would:

- Improve transportation service;
- Increase transit ridership;
- Support future development;
- Support environmental quality;
- Provide cost-effective, achievable transportation solutions; and
- Serve diverse populations.

These goals for the Dulles Corridor Rapid Transit Project were originally developed as part of the 1997 MIS. The goals and objectives were reviewed, discussed, and adjusted in response to stated public concerns over the course of project development throughout the MIS process and as part of the preliminary environmental review process for the Draft EIS. The goals and current objectives for the Dulles Corridor Rapid Transit Project are outlined in Table 1.6-1 on the following page. Because several of the goals are interrelated, some of the objectives apply to more than one goal.

Based on these goals and objectives, a set of specific evaluation criteria were developed to determine the relative advantages and disadvantages of each alternative proposed for the Dulles Corridor Rapid Transit Project. The four basic categories of evaluation criteria were: social, environmental, economic, and transportation. In this Final EIS, these criteria and the results are documented to help decision-makers

understand and identify similarities, differences, and trade-offs between the Locally Preferred Alternative and the No Build Alternative and how the LPA was selected.

Table 1.6-1: Goals and Objectives

Goals	Objectives
Goal 1 Improve Transportation Service	▪ Provide more frequent service for trips to the core of the region, Tysons Corner, Reston/Herndon, Dulles Airport, and eastern Loudoun County. ▪ Provide multi-modal access. ▪ Improve travel times within the corridor and the region. ▪ Provide integrated, seamless transit service to Tysons Corner and other major activity centers. ▪ Provide improved transit service in the corridor in the near term.
Goal 2 Increase Transit Ridership	▪ Provide more frequent service for trips to the core of the region, Tysons Corner, Reston/Herndon, Dulles Airport, and eastern Loudoun County. ▪ Provide multi-modal access. ▪ Improve the amenities of the existing transit service within the corridor and the region. ▪ Improve travel times within the corridor and the region. ▪ Provide integrated, seamless transit service to Tysons Corner and other major activity centers. ▪ Provide improved transit service in the corridor in the near term.
Goal 3 Support Future Development	▪ Provide improved accessibility to existing and planned activity centers in the corridor and the region. ▪ Provide transit service that supports and is consistent with the character of the existing and future land use and development. ▪ Provide stations that are compatible with the character of the surrounding neighborhoods and encourage transit use.
Goal 4 Support Environmental Quality	▪ Contribute to the attainment of regional air quality standards. ▪ Minimize negative impacts to traffic patterns. ▪ Minimize negative impacts on neighborhoods and residential land uses. ▪ Minimize negative impacts to ecologically sensitive areas. ▪ Minimize negative impacts to historic and cultural resources. ▪ Minimize negative visual and aesthetic impacts.
Goal 5 Provide Cost-effective, Achievable Transportation Solutions	▪ Develop transportation improvements that are consistent with the funding and financial capacity of the region. ▪ Minimize project-operating costs. ▪ Optimize cost-effectiveness.
Goal 6 Serve Diverse Populations	▪ Balance benefits and impacts to all residents within the corridor. ▪ Improve accessibility to existing and planned employment centers from low-income and minority areas. ▪ Provide transportation improvements that comply with the Americans with Disabilities Act standards. ▪ Minimize and mitigate negative impacts to low-income and minority populations.

2 ALTERNATIVES CONSIDERED

This chapter provides background information on the range of alternatives considered in the Draft Environmental Impact Statement (Draft EIS) and Supplemental Draft Environmental Impact Statement (Supplemental Draft EIS) for the Dulles Corridor Rapid Transit Project, and a definition of the alternatives evaluated in this Final EIS.

The alternative formerly known as "LPA Phase 1" in the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* has been renamed the Wiehle Avenue Extension in this Final EIS and is expected to begin operations in 2011. This change reflects the federal approach to the project's funding under the Federal Transit Administration's New Starts program. It will assure consistency among the environmental, engineering and financial documents during the project's development.

In the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* as well as this Final EIS, the term "full LPA" represents the Wiehle Avenue Extension and the second phase of the Dulles Corridor Rapid Transit Project. This second phase would extend west from Wiehle Avenue to Washington Dulles International Airport and Route 772 and is expected to begin operations in 2015.

The term "LPA", "proposed action", or "selected LPA" refers to both the Wiehle Avenue Extension and the full LPA collectively.

Section 2.1 provides an overview of preliminary alternatives previously considered but eliminated from further consideration early in the evaluation process.

Section 2.2 provides an overview of the alternatives considered in the Draft EIS and a summary of the Draft EIS findings and recommendations.

Section 2.3 provides an overview of the alternatives considered in the Supplemental Draft EIS and a summary of the Supplemental Draft EIS findings and recommendations.

Section 2.4 presents a description of the alternatives evaluated in this Final EIS, including a comparative summary of the anticipated effects for each alternative.

2.1 ALTERNATIVES PREVIOUSLY CONSIDERED

This section presents an overview of the process that led to the selection of alternatives and includes a brief summary of the reasons why particular alternatives were eliminated from further consideration.

Numerous alternatives were evaluated throughout the environmental review phase of the Dulles Corridor Rapid Transit Project. Consistent with the approach outlined in the *Evaluation Methodology Report* (November 2000), the effectiveness of each alternative was assessed based on social, environmental,

economic, and transportation factors. The evaluation process applied increasingly detailed and comprehensive measures of effectiveness to a decreasing number of alternatives. This process allowed decision-makers to identify similarities, differences, and trade-offs between each alternative, and to carry forward those alternatives that were determined to best achieve the following:

- Improve transportation service;
- Increase transit ridership;
- Support future development;
- Support environmental quality;
- Provide cost-effective, achievable transportation choices; and
- Serve diverse populations.

The initial set of alternatives considered for the Dulles Corridor Rapid Transit Project included various rapid transit modes, alignments, station locations, and ancillary facilities. These alternatives were developed based on recommendations from the *Dulles Corridor Transportation Study* (1997), the *Supplement to the Dulles Corridor Transportation Study* (1999), and the scoping process for the Draft EIS. These initial alternatives were subjected to a two-phase screening process to determine which should be advanced for more detailed evaluation in the Draft EIS. For the initial screening process, most measures were qualitative. Criteria included consistency with land use plans, order of magnitude capital costs, access to activity centers within the Dulles Corridor and the region, and compatibility with existing infrastructure, among others. Alternatives carried forward from initial screening were subjected to a more rigorous evaluation in intermediate screening. In this phase of evaluation, many of the criteria applied during initial screening were measured more quantitatively. Alternatives that performed well were advanced for more detailed evaluation in the Draft EIS. The results of the screening evaluation are documented in detail in the *Final Alternatives Analysis Report* (May 2001).

During the preparation of the Draft EIS and the subsequent public review and comment period, the ongoing development and review of alternatives resulted in several design refinements of existing alternatives, as well as the identification of new alternatives. These refinements and alternatives were evaluated using the methodology developed for the project, and decisions regarding further analysis were based on the same social, environmental, economic, and transportation factors used for initial and intermediate screening. The results of these analyses are documented in post-screening technical memoranda and detailed information on alternatives considered before and after publication of the Draft EIS can be found in the *Addendum to the Final Alternatives Analysis Report* (November 2004).

Based on public comments received, agency coordination, and the evaluation of alternatives documented in the Draft EIS, the Commonwealth Transportation Board (CTB) and the Washington Metropolitan Area Transit Authority (WMATA) Board of Directors selected the Metrorail Alternative as the Locally Preferred Alternative (LPA) for the Dulles Corridor Rapid Transit Project. Later, the two Boards revised the LPA.

Tables 2.1-1 through 2.1-5 present a summary of alternatives that were previously considered during the two-phase screening process, and during the ongoing EIS and public review process. The tables identify the consideration points for the various alternatives and reasons for their elimination from further consideration. Additional information can be found in Appendix H of this Final EIS. More detail about the alternatives considered and the rationale for advancing particular alternatives is presented in the *Final Alternatives Analysis Report*, its *Addendum to the Final Alternatives Analysis Report*, and Attachment A to the *Public Hearings Report Supplement* (November 2002).

Table 2.1-1: Modes Considered

Alternative	Phase During Which Considered	Reason for Elimination
Personal Rapid Transit	Initial Screening	Not a technology intended to provide the long-distance, high-speed service required in the Dulles Corridor.
Light Rail Transit	Initial Screening	Would not be as cost-effective as Metrorail. Would require a transfer, which would reduce ridership. Would have costs similar to Metrorail because it would also require grade separation in Tysons Corner and at Dulles Airport.
Monorail	Initial Screening	Would not be as cost-effective as Metrorail. Would require a transfer, which would reduce ridership. Would have comparable or higher costs than Metrorail.
Feeder System to Metrorail Stations in Tysons Corner (LRT, People Mover)	Initial Screening	Would not be cost-effective. Previous analysis showed feeder system would not enhance ridership on mainline and would substantially add to the cost of the project.
Bus Rapid Transit (BRT) or Express Buses in a Dedicated Lane on the Dulles International Airport Access Highway (DIAAH)	Initial Screening	Current and future traffic projections do not warrant construction of a dedicated lane as part of the project. At worst, during peak periods, traffic flow is expected to be moderately congested.
BRT	Initial Screening, Draft EIS	Would not provide same degree of improvements in transportation service or overall transit ridership as Metrorail. Would be less likely to support focused development patterns. Overall, would not satisfy long-term travel demand in corridor.
Dulles Plan B Proposed a combination of BRT and increased use of the high-occupancy lanes along the Dulles Toll Road, as well as several forms of "private transit," including just-in-time ridesharing (i.e., casual carpooling, slug lanes) and high-occupancy toll lanes.	Public Review and Comment Period	Increased use of High Occupancy Vehicle (HOV) lanes would have benefits, but such an increase would not dramatically increase the person-moving capacity of the corridor. HOV incentives could reduce, rather than enhance, demand for transit in the corridor. "Private" transit modes were determined to be either infeasible in the corridor, or not as beneficial as suggested in Dulles Plan B.

Table 2.1-2: Alignments Considered (Metrorail Only)

Alternative	Phase During Which Considered	Reason for Elimination
Route 7 (T7)	Initial Screening	Would not serve the eastern part of Tysons Corner area as effectively as other alternatives.
Tysons DIAAH Station with Feeder System (T8)	Initial Screening	Previous analysis showed forced transfer would lower ridership, and alternative may have impacts on residences and historic resources near proposed median station.
Partial Double-Track Loop (T10)	Initial Screening	Could provide operational flexibility, but flexibility could be provided by lower-cost options. Additional costs and impacts would yield little or no additional benefits.
Large Aerial Loop (T11) and Beltway Access through Tysons (B1)	Initial Screening	Alignments would have higher costs but no greater benefits than other alternatives. B1 would require substantial right-of-way acquisition, and T11 would provide inferior service coverage compared to other loop alternatives.
Direct Service to Reston Town Center (D2)	Initial Screening	Not consistent with existing or planned land use, and would also preclude continued use of Section 4(f) parkland (Washington and Old Dominion Trail [W&OD Trail]) in certain areas. The DIAAH median is a prudent and feasible alternative to park use.

Alternative	Phase During Which Considered	Reason for Elimination
Dulles, I-66, Route 50, and Route 28 Connection (S1)	Initial Screening	Large loop inconsistent with federal guidelines for defining scope of project. The various segments of proposed alignment should be studied as separate projects.
Western Leg with Service to West Falls Church (O2)	Initial & Intermediate Screening	Would have substantially higher costs, but negligible increases in ridership. Would also have greater impacts on adjacent communities.
Tysons Aerial Loop (T2) and Tysons Underground Loop (T5)	Initial & Intermediate Screening	T2 would have greater potential for noise and visual impacts than a similar alignment. T2 would also have operational difficulties and higher costs, but would offer modest ridership benefits. T5 would have fewer impacts, but much higher costs and greater risk of cost escalation due to extensive underground construction.
Interface with Beltway Rail Line (T3)	Initial & Intermediate Screening	Beltway rail line not developed at a level of detail that would make it appropriate or feasible to conduct detailed coordination efforts. As work progresses, project team will coordinate to the extent feasible on a connection between systems.
Split Service with Local Tysons Leg and Express Leg to Rest of Corridor (T12)	Public Review and Comment Period	Would have greater costs and impacts than Draft EIS alternatives, would not effectively serve corridor activity centers, and would likely result in ridership reductions. Service would be difficult to integrate with existing Metrorail operations.
Underground Version of T6 (T13)	Public Review and Comment Period	Would have much greater costs than Draft EIS alternatives, with no additional transportation service benefits. Reduction of visual and noise effects can be achieved through much lower cost mechanisms.
Variation of T4 with Two Underground Segments (T14)	Public Review and Comment Period	Would have greater costs, increased risks, no additional ridership benefits, and the same operational complexities as T4. However, it is a viable approach for mitigating visual effects of T4. Was eliminated because T4 was not selected as the LPA.
Alignment T1	Initial & Intermediate Screening, Draft EIS	Would have similar impacts to T6, but would include fewer stations and provide less service within the core of Tysons Corner.
Original Alignment T9	Initial & Intermediate Screening, Continued Development of Draft EIS	Revised version of Alignment T9 was carried forward in lieu of alignment advanced from screening. Revised alignment offered cost savings, enhanced structural efficiencies, and reduced visual effects. Though noise effects and right-of-way requirements for revised alignment were greater, it allowed for a wider range of Tysons Corner configurations to be considered in detail.
Alignment T9	Continued Development of Draft EIS, Draft EIS	Would have greater visual effects and less operational flexibility than T6. Would also potentially conflict with improvements planned at the Route 123/Capital Beltway interchange.
Alignment T4	Initial & Intermediate Screening, Draft EIS	Would attract less ridership than T6 (due to one-way track segments in core of Tysons Corner) and would have much greater visual effects.

Table 2.1-3: Station Options Considered

Alternative	Phase During Which Considered	Reason for Elimination
Stations that were only associated with Alignments T7, T8, T11, and D2	Initial Screening	Eliminated because alignments were eliminated.
Addition of Hunter Mill Road Station	Initial Screening	Not consistent with existing or planned land use, and low-density development at proposed site would not generate enough ridership to support station. Strong opposition from public and Land Use Task Force.
Platform connection to West Falls Church Station for O2	Initial & Intermediate Screening	Eliminated because alignment was eliminated.
The MIS Tysons Central Station for T1	Initial & Intermediate Screening	Location proposed in MIS eliminated because shifting station to east would reduce costs, have better connections to existing and planned development, and higher potential for joint development.
Wolf Trap Station as a Special Use Station	Initial & Intermediate Screening	Based on agency coordination, station and access facilities were eliminated. However, project will include provisions to accommodate a station in the future.
Relocation of Wiehle Avenue and Reston Parkway Stations Under or Near Highway Overpasses	Initial & Intermediate Screening	Shifting the stations would increase costs and have substantial impacts, but would offer few benefits. Proposed land use density bonuses would move with stations, therefore ridership potential would not increase above levels for previously proposed station locations.
Accommodation for Route 28 LRT	Initial & Intermediate Screening	Plans for a Route 28 LRT system not developed at a level of detail that would make it appropriate or feasible to conduct detailed coordination efforts. Study for such a system not underway or planned in future.
Five Median Station Convertibility Concepts for Phased Implementation Alternative	Continued Development of Draft EIS	Three concepts eliminated because they violated station width criteria used for analysis. Two other concepts eliminated because they would require reduced running speeds, have the potential to damage the third rail during BRT operations, and would limit rail testing and startup to non-revenue hours.

Table 2.1-4: Yard Locations Considered

Alternative	Phase During Which Considered	Reason for Elimination
Nine potential yard sites in Loudoun County	Initial Screening	Inconsistent with local land use plans or zoning, or constrained/crossed by important water resources.
Two sites for BRT maintenance facility and rail yard near Route 606 interchange (Y6, Y10)	Initial & Intermediate Screening	Topography and presence of water resources restrict suitability of Y6, and Y10 would require extensive property acquisition.
Rail yard site at south end of Dulles Airport property (Y13)	Initial & Intermediate Screening	Inconsistent with approved Airport Layout Plan and may affect environmental resources. Would also result in significantly higher capital and operating costs due to length of yard lead.
Two potential yard sites in Loudoun County and three potential yard sites on Dulles Airport Property	Continued Development of Draft EIS/ Supplemental Rail Yard Study	Eliminated based on environmental constraints, inconsistencies with land use plans, or operational constraints.
Yard Site 7	Initial & Intermediate Screening, Draft EIS	Would be least consistent with existing land use, future land use plans, and existing zoning requirements, and would have greater negative effects on economic development in Loudoun County.

Alternative	Phase During Which Considered	Reason for Elimination
Yard Site 20	Supplemental Rail Yard Study, Draft EIS	Would be less consistent than Y15 with existing land use and future land use plans and would have greater negative effects on economic development in Loudoun County.

Table 2.1-5: Alternatives Considered

Alternative	Phase During Which Considered	Reason for Elimination
Baseline Alternative	Draft EIS	Would not provide improved transit service in the Dulles Corridor as well as Build Alternatives. Would offer lower level of transit service, so would not provide same mobility benefits. Would also be inconsistent with local and regional comprehensive plans, which specifically call for rapid transit improvements in Dulles Corridor.
BRT Alternative	Draft EIS	Would not provide same degree of improvements in transportation service or overall transit ridership as Metrorail. Would be less likely to support focused development pattern. Overall, would not satisfy long-term travel demand in corridor.
BRT/Metrorail Alternative	Draft EIS	Would not perform as well as Metrorail in terms of transportation and land use benefits.
Phased Implementation Alternative	Draft EIS	Would have greater costs, and would not offer a substantial increase in benefits because end state would be identical to Metrorail Alternative.
Original LPA (Metrorail T6/Y15)	Supplemental Draft EIS	Would not include design refinements suggested by the public and by federal, state and local agencies.

2.2 DRAFT EIS ALTERNATIVES AND RECOMMENDATIONS

The Draft EIS evaluated the potential effects of several alternative transit improvements for the Dulles Corridor. In addition to a No Build Alternative, four Build Alternatives that primarily ran along the Dulles Connector Road, the DIAAH, and the Dulles Greenway were evaluated. The alternatives included:

- **No Build (Baseline) Alternative.** The No Build Alternative was consistent with the "no-action alternative" required by the Council of Environmental Quality's (CEQ's) regulations for implementing the *National Environmental Policy Act of 1969* (NEPA), as amended, and provided a baseline for comparison against which the other alternatives were evaluated in the Draft EIS. The No Build Alternative included existing highway and public transportation infrastructure in the Dulles Corridor, and transportation system improvements that were included in the Washington metropolitan region's constrained long-range transportation plan and committed to be implemented by 2025, aside from the Dulles Corridor Rapid Transit Project.
- **Bus Rapid Transit (BRT) Alternative.** BRT is a bus-based transit system that operates like a rail system. Passengers on BRT are provided rail-like amenities such as off-board fare collection, level boarding, enhanced stations, and platforms. Because it often takes advantage of roadway facilities, BRT is generally a lower-cost transit technology than rail. Three alignment options were considered for the BRT Alternative in the Draft EIS.
- **Metrorail Alternative.** Metrorail is the region's rapid rail system. It is powered by an electrified third rail and operates in exclusive rights-of-way. By using multiple-car trains, Metrorail is capable of moving high volumes of passengers. Key features of the Metrorail system include fixed stations, dedicated rights-of-way, advanced fare collection, relatively simple transfers between

different lines, and multiple-door boarding from level platforms. For the Metrorail Alternative, several alignment options were considered in Tysons Corner, and three sites were considered for a Metrorail Service & Inspection (S&I) Yard in Loudoun County.

- **BRT/Metrorail Alternative.** This alternative combined the BRT and Metrorail alternatives. Metrorail would be constructed in the eastern part of the Dulles Corridor as far as Tysons Corner, and BRT would be constructed in the western part of the corridor to Route 772 in Loudoun County.
- **Phased Implementation.** This alternative combined the other three Build Alternatives into a program of rapid transit improvements that would be implemented in stages (BRT, then BRT/Metrorail, then Metrorail). This approach would allow decision-makers to begin to address the travel needs in the corridor with rapid transit in the near term, while allowing for future development of rail.

Each of the Build Alternatives included several stations located in the median of the DIAAH, which were similar to stations on the existing Metrorail system. The BRT stations were designed to allow future conversion to rail stations. The alternatives also included the development of station and ancillary facilities such as parking and bus transfer facilities, a bus maintenance and storage facility, a rail S&I Yard, rail traction power substations and tie-breaker stations, and stormwater management facilities.

Evaluation of alternatives in the Draft EIS showed that the No Build Alternative would not provide the same level of transit benefits to address needs in the Dulles Corridor as the Build Alternatives. Depending on the mode selected, the Build Alternatives would provide a range of transit services with different "trade-offs" relating to quality of service, benefits, and impacts. The advantages of BRT relative to Metrorail included improvements in corridor transit service at an earlier date, fewer impacts on the natural environment, fewer noise and visual impacts to communities, lower traffic impacts in the vicinity of stations (though still higher than the No Build Alternative), lower costs, and higher cost-effectiveness. Metrorail had several benefits relative to BRT, including greater improvements in transportation service and capacity, greater increases in overall transit ridership, more focused support for future development, and enhanced service to diverse populations. While the Metrorail Alternative was predicted to attract more riders than the BRT Alternative overall, the BRT Alternative was found to be less costly to build than the Metrorail Alternative, and therefore the BRT Alternative had a higher cost-effectiveness. The BRT/Metrorail Alternative would have some of the advantages and disadvantages of both BRT and Metrorail, and the Phased Implementation Alternative would have all of the benefits and impacts of BRT and Metrorail combined, at a higher cost due to incremental implementation.

The Metrorail Alternative was the most preferred by citizens submitting comments for the public record. While the BRT and BRT/Metrorail Alternatives would perform better in terms of cost-effectiveness and implementation time, the BRT Alternative would not provide direct service connections to Tysons Corner, and the BRT/Metrorail Alternative would require a mode transfer in Tysons Corner for service to the western portion of the corridor. The Phased Implementation Alternative could be implemented sooner than Metrorail, but would have higher capital costs and no additional ridership or economic development benefits relative to the Metrorail Alternative.

As a result of the Draft EIS technical analysis, public comment, and agency coordination, the Metrorail Alternative on Alignment T6 and with S&I Yard Y15 was selected as the Locally Preferred Alternative (LPA) in late 2002. On November 21, 2002 WMATA's Board of Directors amended the Adopted Regional System (ARS) to include the Metrorail Alternative (T6/Y15), contingent upon the fulfillment of six conditions (a seventh was added April 2004) as noted below:

- Satisfactory completion of the Final Environmental Impact Statement;
- Issuance of a Record of Decision by FTA;
- Board approval of a final financial plan for the construction, acquisition and operation of the new facilities;
- Execution of implementing financial commitments between Virginia Department of Rail and Public Transportation (DRPT) and funding sources in the form of local funding agreements and the Federal full funding agreement;
- WMATA's determination that the project has been completed in accordance with the Final Environmental Impact Statement, approved General Plans and all WMATA system requirements and that the project, as built and tested, is suitable for acceptance into the Adopted Regional System;
- Conveyance to WMATA by DRPT of a property interest in the project property adequate to assure WMATA's continuing control of the project property throughout the useful life of the project; and
- Any indemnification obligation from WMATA to Toll Road Investors Partnership II, the Metropolitan Washington Airports Authority, or any other entity associated with the project is subject to Board approval and any indemnification obligation provided by DRPT to Toll Road Investors Partnership II, Metropolitan Washington Airports Authority, or any other entity associated with the project will be subject to a determination by WMATA that such indemnification does not create a liability or potential liability for WMATA.

On December 19, 2002, the CTB concurred with the WMATA Board and formally selected the Metrorail Alternative (T6/Y15) as the LPA for the project. The Metropolitan Washington Airports Authority (MWAA) endorsed the Metrorail Alternative in late 2002, and the Boards of Supervisors for Fairfax and Loudoun Counties and the Town of Herndon also endorsed the selection of the Metrorail Alternative.

The Metrorail Alternative was recommended as the LPA because relative to the other alternatives, it would:

- Provide for higher ridership and new transit riders, as well as higher transit mode share for most of the corridor;
- Provide better access to corridor activity centers and increase overall mobility in the corridor;
- Offer shorter travel times for trips within the corridor;
- Support the comprehensive plans of Fairfax and Loudoun Counties in a manner consistent with existing transportation infrastructure and planned improvements;
- More likely to support focused transit-oriented development;
- Reduce the potential for neighborhood effects through Tysons Corner;
- Support the region’s air quality plans by contributing to the reduction in emissions thereby improving the region’s air quality; and
- Provide more operational flexibility in Tysons Corner.

2.3 SUPPLEMENTAL DRAFT EIS ALTERNATIVES AND RECOMMENDATIONS

Based on subsequent public and agency coordination after the completion of the Draft EIS and after an LPA was recommended, DRPT and WMATA identified a series of modifications to the project to resolve outstanding design issues, reduce environmental and community impacts, and allow for construction of the project in two phases. The Supplemental Draft EIS was prepared to assist decision-makers and the

public in understanding the effects of the proposed modifications to the selected LPA. A comparative evaluation was presented for the following alternatives:

- **No Build Alternative.** The No Build Alternative for the Supplemental Draft EIS was the same as the Baseline Alternative defined in the Draft EIS. The alternative included existing transportation infrastructure and services, as well as improvements included in the region's constrained long-range plan and planned to be implemented by 2025. The No Build Alternative provided a baseline for comparison against which the other alternatives were evaluated.
- **Metrorail Alternative (T6/Y15).** This alternative was the Metrorail Alternative evaluated in the Draft EIS and originally selected as the LPA (with Alignment T6 through Tysons Corner and a new S&I Yard at Site 15). The alternative would generally follow an alignment between the Metrorail Orange Line near West Falls Church Station and Route 772 in Loudoun County, using the median of the Dulles Connector Road, the DIAAH, and the Dulles Greenway. It would include 11 new stations and ancillary facilities, such as a new Metrorail S&I Yard, traction power substations, tie-breaker stations, and stormwater management ponds. The Metrorail Alternative (T6/Y15) was included in the Supplemental Draft EIS to facilitate understanding of the changes in effects associated with the proposed modifications to the LPA.
- **Proposed LPA.** The proposed LPA would be similar to the Metrorail Alternative (T6/Y15) in terms of alignment, stations, facilities, and operating characteristics. The primary difference between the two alternatives is that the LPA would be implemented in two phases. For the Wiehle Avenue Extension, Metrorail would be constructed from the Metrorail Orange Line through Tysons Corner to Wiehle Avenue, with interim express bus service in the western portion of the corridor until rail service could be extended. The Wiehle Avenue Extension is anticipated to open in 2011 with the full LPA opening in 2015. Other differences between the proposed LPA and the Metrorail Alternative (T6/Y15) include additional improvements at West Falls Church S&I Yard to accommodate operation of the Wiehle Avenue Extension or the full LPA; adjustments to alignment plans and profiles for a variety of purposes including reducing potential noise impacts, visual impacts, costs, or to improve operational efficiency; and design modifications of station site plans and ancillary facilities to address operational changes or to respond to concerns of local jurisdictions and landowners.

Evaluation of alternatives in the Supplemental Draft EIS showed that many of the benefits and potential effects of the proposed LPA were similar to those presented for the Metrorail Alternative (T6/Y15) in the Draft EIS. The proposed LPA would provide a greater degree of improvement in Dulles Corridor transit services than the No Build Alternative, and overall would provide similar support for future development in the Dulles Corridor to the Metrorail Alternative. Relative to the Metrorail Alternative, the design modifications for the proposed LPA would result in slightly higher ridership, reduced visual impacts at the eastern end of the corridor, and an increase in impacts on streams and water quality in the western end of the corridor. The full LPA would provide higher transportation and economic development benefits than the Wiehle Avenue Extension, and the Wiehle Avenue Extension would not be consistent with future land use designations or future land development patterns west of Wiehle Avenue. Although implementation of more express bus service in the western end of the corridor for the Wiehle Avenue Extension would typically have minimal physical effects, this service would also result in fewer transportation and development benefits.

General consensus among elected officials, public agencies, and the general public held that Metrorail should be ultimately extended for the full length of the Dulles Corridor from the existing Orange Line through Tysons Corner to Route 772 in Loudoun County. The proposed LPA was supported by the

majority of the public submitting comments for the public record, although a number of commenters expressed concerns about project phasing, Wiehle Avenue as the interim end-of-the-line station under the Wiehle Avenue Extension, and noise and visual mitigation measures.

Based on the analysis contained in the Supplemental Draft EIS, public comments received on the document, and agency coordination, the CTB approved the revision of the LPA in March 2004 to incorporate the elements required for phased construction and the design refinements outlined in the Supplemental Draft EIS and recommended in the Public Hearings Report. On April 15, 2004 the WMATA Board also approved the revision of the LPA as outlined in the Supplemental Draft EIS and recommended in the Public Hearings Report.

2.4 FINAL EIS ALTERNATIVES

This Final EIS was developed to respond to comments and issues raised during the circulation of the Draft EIS and the Supplemental Draft EIS and to provide more detailed information on the design of proposed mitigation measures for unavoidable impacts associated with the project. This Final EIS presents an evaluation of the following alternatives:

- The No Build Alternative (the baseline for comparison); and
- The Wiehle Avenue Extension and the full LPA, which are assumed to open by 2011 and 2015, respectively.

These alternatives are described in more detail in the following sections.

2.4.1 NO BUILD ALTERNATIVE

2.4.1.1 Introduction

The No Build Alternative includes all existing highway and transit infrastructure and services within the corridor and any that are committed to be implemented by 2025, aside from the Dulles Corridor Rapid Transit Project. The following elements are included:

- Existing highways;
- Existing Metrorail infrastructure;
- Existing WMATA, Fairfax Connector, and Loudoun County bus services;
- Planned highway and transit improvements through 2025 included in the 2003 update to the Metropolitan Washington Council of Government (MWCOG) financially constrained long-range plan (CLRP), which was adopted on December 17, 2003;
- Marginal increases in local transit service and capacity commensurate with forecast population growth in the corridor through 2025; and
- Implementation of eight-car train operations, reconfiguration of lines and longer headways in the Metrorail system to meet travel demand and to improve reliability.

The highway and transit networks defined for the No Build Alternative are also used as a starting point for the LPA. The No Build network differs from the LPA network by the amount of proposed investment in transit services and facilities.

The No Build Alternative evaluated for this Final EIS is an updated version of the No Build Alternative evaluated in the Draft EIS and reflects changes in the existing highway and transit networks and changes in future plans for infrastructure and services. Since the publication of the Draft EIS, several of the

planned projects included in the Baseline Alternative were completed and some transit services have been modified. In addition, plans for future improvements have been amended due to recent events, budget concerns, and changes in priorities.

2.4.1.2 Detailed Description of the No Build Alternative

This section provides a detailed description of the transportation facilities and services associated with the No Build Alternative. As indicated in Section 2.3, the No Build Alternative includes all existing highway and transit infrastructure and services within the corridor and any that are committed to be implemented by 2025, aside from the Dulles Corridor Rapid Transit Project.

The No Build Alternative for the Final EIS is an updated version of the No Build Alternative evaluated in the Draft EIS. Several recent events have affected the range of planned improvements included in the No Build Alternative.

In November 2002, the transportation sales tax referendum that was put to the Northern Virginia voters failed to pass, making funding questionable for some of the projects previously included in long-range plans. The Virginia Department of Transportation (VDOT) and the counties were forced to rethink their long-range plans, and some of the projects included in the Draft EIS No Build Alternative are no longer expected to be implemented by 2025.

Through the current Metro Matters initiative, WMATA is seeking funding from federal sources and its compact jurisdictions for the most crucial elements of the CIP's Infrastructure Renewal Program and its Systems Access Program. The Metrorail sub-element of Metro Matters is most important for the Dulles Corridor Rapid Transit Project since it implements eight-car train operations. Metro Matters would fund the Metrorail improvements of the No Build Alternative for the opening years of the Wiehle Avenue Extension and the full LPA. The evaluation of Build Alternatives in the Draft EIS, Supplemental Draft EIS and this Final EIS have assumed that the No Build Alternative includes eight-car train operations.

The Draft EIS No Build Alternative was based on the projects included in the 2000 CLRP, which was the last comprehensive update of the CLRP (including financial analysis). Federal planning regulations require that the long range plan be updated every three years to reflect changes in funding capacities and anticipated needs. The Final EIS No Build Alternative reflects the planned projects included in the 2003 update to the CLRP, which was adopted in December 2003.

A. No Build Alternative Transit Network

The No Build Alternative includes all existing transit facilities in the region, as well as transit improvements included in local transit plans and in the 2003 update to the CLRP through 2025. The following section summarizes existing and planned transit services and facilities for both the corridor and the greater Washington metropolitan region. The bus network for the No Build Alternative within the Dulles Corridor is shown in Figure 2.4-1 with routes identified by transit service provider. Additional information on planned transit improvements is provided in Chapter 6 of this Final EIS.

This Page Intentionally Left Blank

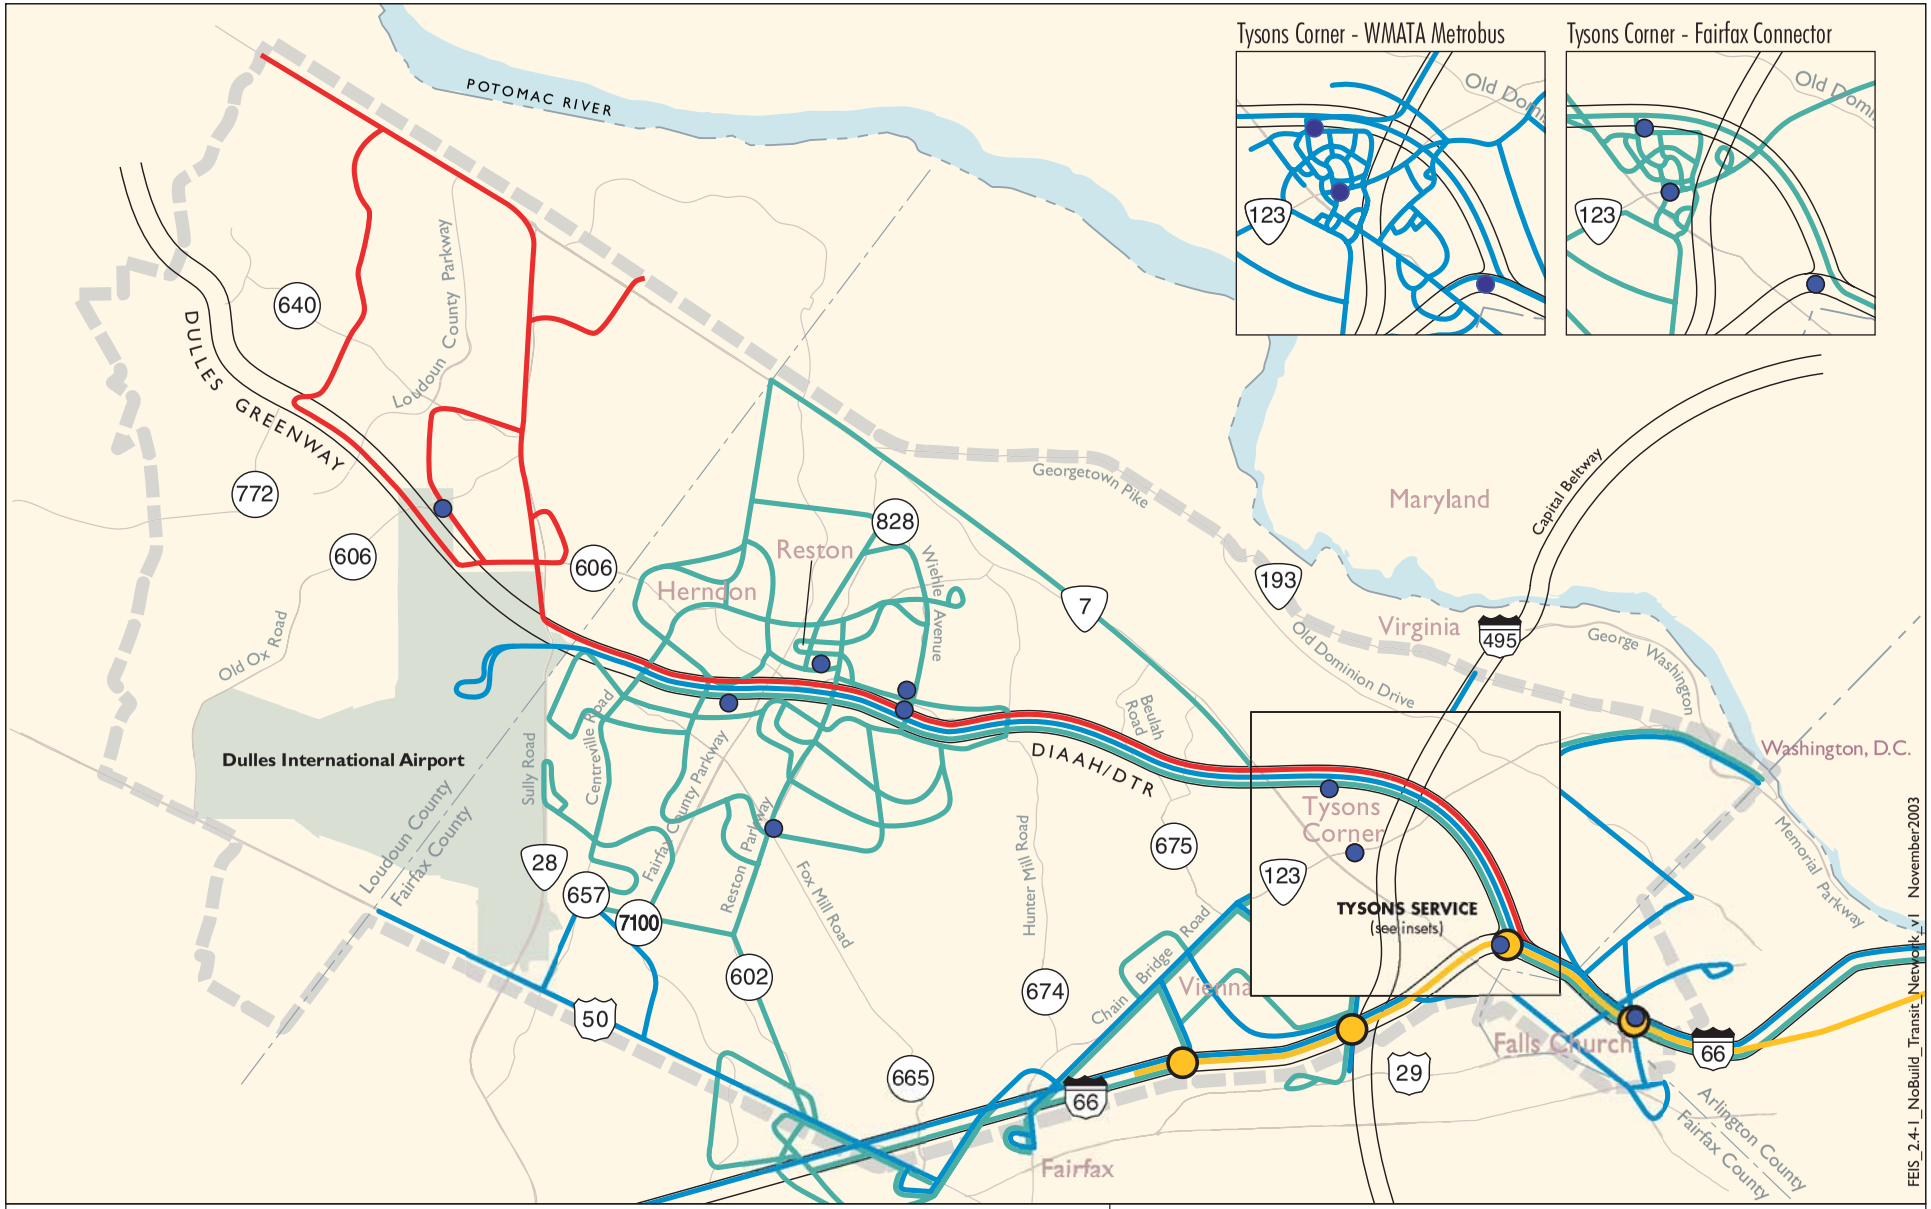

Figure 2.4-1

No Build Transit Network within the Dulles Corridor (2025)

Dulles Corridor Rapid Transit Project

Corridor Transit Services and Facilities

Three transit providers currently serve the Dulles Corridor: Fairfax County, Loudoun County, and WMATA. The range of services in 2003, which are included in the No Build Alternative, are outlined below.

Fairfax County's Connector service operates 28 routes in the corridor, including a) express bus service operating in the Dulles Toll Road and DIAAH, connecting major park-and-ride facilities and other areas of Herndon and Reston with Tysons Corner, the West Falls Church Metrorail Station, and the Pentagon Metrorail Station; and b) feeder bus and circulator services operating within Herndon, Reston, and Tysons Corner. In 2002, Fairfax County enhanced its bus service in the Dulles Corridor by improving peak and midday headways for Reston circulator services, and by increasing peak-period service from Reston to Tysons Corner Center and the West Falls Church Metrorail Station. Fairfax Connector operates approximately 166,000 revenue hours annually in the corridor, with a peak-period requirement of 65 buses. Current service represents a significant increase over 1998 service (65,000 hours of annual revenue service, 43 peak-period buses). Fairfax Connector ridership in the corridor averages approximately 13,800 weekday passengers.

Loudoun County contracts with a private provider to operate express bus trips during the peak period each weekday from communities within the county to Rosslyn, the Pentagon, and Washington, D.C. There are 16 peak-direction trips during the a.m. peak and 15 trips during the p.m. peak. The County recently expanded service to include peak-period, reverse commute trips from West Falls Church Metrorail Station to Dulles North Transit Center and the MCI/AOL campuses (one trip in the a.m. peak, and two in the p.m. peak). New service also includes new local circulator routes: one in the Sterling area, one along Route 7, one between Dulles Airport and the Dulles Town Center, and one in the Purcellville area. Current service results in approximately 12,000 annual hours of revenue service and 1,700 average weekday passengers.

WMATA operates 14 regional bus routes that either begin or end in the Dulles Corridor. Most of this service provides connections to Tysons Corner, with some circulation within the Tysons area.

Several major intermodal facilities are located in the corridor, including the Dulles North Transit Center in Loudoun County at the Route 606/Dulles Greenway interchange; the Herndon-Monroe Park-and-Ride lot in Herndon; three park-and-ride lots in Reston (Reston South, Reston East, and Reston North); and the Tysons-Westpark Transit Station in Tysons Corner, which provides Kiss & Ride access to Fairfax Connector and WMATA service, but no parking. In addition, the Metrorail Orange Line serves the eastern end of the corridor and would have eight-car trains operating at seven-minute headways during the peak period in year 2025, and in the opening year. Parking and bus transfer facilities are located at the East Falls Church and West Falls Church Metrorail Stations. Additional Metrorail Orange Line facilities—the Dunn Loring and Vienna Stations—are located farther west along I-66.

The eastbound shoulder on the Dulles Connector Road between Magarity Road and the West Falls Church Metrorail Station has been reinforced and widened to allow buses to bypass congestion to improve service reliability. Three at-grade ramps allow for bus access between the DIAAH and the Dulles Toll Road to improve safety and schedule reliability. These ramps, located near Beulah Road and Hunter Mill Road, are used by Fairfax Connector and Loudoun County services.

Planned transit improvements in the corridor include all bus and ancillary facilities (e.g., park-and-ride lots) in the update to the 2003 CLRP, minus the Dulles Corridor Rapid Transit Project. The No Build

Alternative also includes bus service enhancements proposed for Fairfax and Loudoun Counties to meet forecast growth in population and employment.

Specific improvements include the Reston Town Center Transit Center, a proposed new transit center for Fairfax Connector service to be located on the south side of Bluemont Drive, between Explorer Street and Library Street. Construction is expected to be completed in the next three to five years.

Loudoun County's longer-term transit expansion plans include the addition of two local routes to improve circulation within the county. In addition, the County plans to add more capacity to their existing express bus routes as demand warrants.

With the exception of the Reston East Park-and-Ride lot, the existing park-and-ride facilities in the corridor will remain at their current size. Fairfax County plans to expand the Reston East Park-and-Ride to include a multi-level garage with 2,300 spaces by 2010.

Regional Transit Services and Facilities

The No Build Alternative also includes several public transportation systems and services that operate outside of the Dulles Corridor. These services and facilities include the 103-mile Metrorail system with 8-car trains, (and line reconfiguration and longer headways), and commuter rail service operated by Virginia Railway Express (VRE) and Maryland Commuter Rail (MARC).

Local bus service provided by WMATA, Montgomery County, MD (Ride-On), the City of Alexandria, VA (DASH), the Prince George's County Bus; and Arlington County Transit are also included in the No Build Alternative.

Transit improvements planned for the larger Washington metropolitan region are also part of the No Build Alternative. Some of these projects are listed below:

- New Metrorail Station at New York Avenue in Washington, D.C.;
- New Metrorail/VRE station at Potomac Yards in Arlington, VA;
- Blue Line Metrorail extension to Largo, MD;
- New VRE station in western Fairfax County, VA;
- New MARC station at Route 355/Randolph Road in Rockville, MD; and
- Bi-County Transitway from Bethesda to Silver Spring to New Carrollton in Maryland.

The proposed extension of the Metrorail Orange Line from Vienna to Centreville, recently studied by VDOT and DRPT, is not in the 2003 update to the CLRP. Therefore it is not included in the No Build Alternative.

Assumed Operational Improvements for Regional Rail

Assumptions for Metrorail operating conditions under the Final EIS No Build Alternative are different than those for the Draft EIS Baseline Alternative. For the Draft EIS, it was assumed that, in the future, Orange Line, Blue Line, and Orange Line Supplemental services would continue to operate with existing service patterns and frequencies (six-minute headways in the peak period, 12-minute headways in the off-peak period). For the Final EIS No Build Alternative, Metrorail services were adjusted.

Peak-period service frequencies on the Orange and Blue lines would be reduced from six-minute headways (ten trains per hour) to approximately seven minutes (eight to nine trains per hour), and half of the peak-period Blue Line trains would be diverted from the Rosslyn tunnel to the Yellow Line to

accommodate additional Orange Line service from Vienna. Supplemental Orange Line service would continue to operate from Vienna and West Falls Church. The four to five diverted Blue Line trains would continue to Greenbelt, while four to five Orange Line trains would be diverted to Largo and the eastern end of the Blue Line.

Supplemental peak hour service on the Orange Line would be modified to operate to Stadium-Armory rather than New Carrollton. Service would operate in both directions between West Falls Church and Stadium-Armory and Vienna and Stadium-Armory, rather than in the peak direction only. In addition, service would be expanded to operate for the full peak period, rather than in the peak hour only.

In addition, the No Build Alternative assumes improvements that would allow the regional Metrorail system to continue to meet passenger demand for rail transit service through 2025, with passenger loads as close as possible to desired standards. These improvements, which are in WMATA's adopted 10-Year Capital Improvement Plan (CIP), include the expansion of train operations from six- to eight-car trains for 75 percent (by the year 2025) of the trains operating in the peak period, the associated upgrade of traction power systems, and the upgrade of train control systems to allow for precise stopping of eight-car trains at stations. For the No Build Alternative in 2011, Metro Matters, which is a subset of the CIP, would fund the expansion of trains to eight cars for 33 percent of trains operational in the peak period.

At the time the Draft EIS was published, it was anticipated that the CIP would also include an upgrade of the train control system that would allow trains to run closer together along the mainline tracks in the system's core. However, it was determined that the funding capacities of WMATA Compact member jurisdictions could not support this system upgrade and as a result, WMATA adjusted its planned future operating plans for the Metrorail system.

B. No Build Highway Network

The baseline highway network includes existing highways and other major roadways in the region, as well as all regionally significant highway capacity improvements currently included in the approved list of projects for the region's 2003 update to the CLRP. This baseline highway network is assumed for the No Build Alternative, the Wiehle Avenue Extension and the full LPA. The following sections summarize the major highways, arterials, and other important roadway facilities within the Dulles Corridor. These roadways are depicted in Figure 2.4-2. Additional information regarding existing roadways and planned improvements is provided in Chapter 6 of this Final EIS.

Existing and Planned Highway Facilities in the Corridor

The major highway facilities within the Dulles Corridor, their existing capacity, and planned improvements included in the 2003 update to the CLRP are outlined in Figure 2.4-2.

Interstate 66 – Inside the Capital Beltway, I-66 is a four-lane, limited-access facility connecting Washington, D.C. with Arlington and eastern Fairfax County. High Occupancy Vehicle restrictions (HOV-2) are in effect on both inbound lanes each weekday morning and on both outbound lanes each evening peak period. Outside of the Beltway, I-66 is a six-lane facility in non-peak periods. The shoulder of the roadway is open to traffic in the a.m. (inbound) and p.m. (outbound) peak periods. HOV-2 restrictions (two persons per vehicle) are also in effect for one lane in the a.m. (inbound) and p.m. (outbound) peak periods. The I-66/I-495 and I-66/US 29 interchanges are planned to be reconstructed by 2011.

This Page Intentionally Left Blank

Figure 2.4-2

Major Roadways in Baseline Highway Network (2025)

Dulles Corridor Rapid Transit Project

Dulles Connector Road – This four-lane facility serves traffic using I-66 to and from the east, the Capital Beltway, Route 123, the Dulles Toll Road, and the DIAAH. In the eastbound direction, the shoulder of the Connector Road has been widened and reinforced, and buses are permitted to use it during periods of severe congestion. The Dulles Connector Road is owned by the federal government, leased by MWAA, and operated by VDOT.

Interstate 495 (the Capital Beltway) – This is an eight-lane circumferential facility serving the entire metropolitan area. Within the corridor, I-495 links Tysons Corner with westbound I-66, the Dulles Toll Road, and with communities to the south and east of the corridor. Widening of the I-495/Dulles Toll Road interchange was completed in 2003. Capacity improvements, including the addition of an HOV lane in each direction, are planned for I-495 between the American Legion Bridge and the I-395/I-495/I-95 interchange, including ramps providing direct HOV access through Tysons Corner at Route 123. HOV improvements are expected to be implemented between the Dulles Toll Road and I-66 by 2011, between I-66 and the I-395/I-495/I-95 interchange by 2012, and between the American Legion Bridge and the Dulles Toll Road by 2013.

Dulles Toll Road – This eight-lane toll facility serves the communities of Vienna, Reston, and Herndon between Tysons Corner and the Fairfax/Loudoun County border. Peak-period HOV-2 restrictions are in effect on one lane in the a.m. (inbound) and p.m. (outbound) peak periods. Toll collection improvements were implemented at the Spring Hill Road interchange in 2003, and interchange improvements are planned at Hunter Mill Road by 2010. The current toll on the Toll Road ranges from $0.25 to $0.85 for passenger vehicles. Bonds used to construct the Toll Road are set to expire in 2016.

Dulles International Airport Access Highway (DIAAH) – This is a four-lane facility in the median of the Dulles Toll Road. The DIAAH is owned by the federal government and operated by MWAA. Use of the DIAAH is restricted to passengers, customers, and personnel of Dulles Airport. MWAA is planning to add an additional lane in each direction on the DIAAH after 2010, or when average daily traffic on the facility reaches an unacceptable level of service; the improvements have not yet been programmed.

Dulles Greenway – This is a four- to six-lane privately owned and operated toll facility extending west to Route 7 in Leesburg, Virginia. Tolls on the Greenway range from $0.75 to $2.00, depending upon point of entry and method of payment. A third lane in the eastbound direction between Route 772 and the mainline toll plaza opened in December 2000, and a third lane in the westbound direction was completed in 2003. Construction of two new interchanges at Route 653 and Battlefield Parkway is expected to be complete by 2004, and the Greenway will be widened to six lanes between Route 901 and its western terminus at the Routes 7/15 Bypass by 2006.

Other Significant Regional Roadways

In addition to the highways described above, several other major arterials serving regional travel patterns are located within the Dulles Corridor.

Route 7 (Leesburg Pike) – This is a four- to six-lane facility generally parallel with the Dulles Connector Road from the West Falls Church Metrorail Station into and through Tysons Corner, where it interchanges with the Dulles Toll Road and continues northwest into northern Fairfax and Loudoun Counties. Route 7 within Tysons Corner is planned for expansion from six to eight lanes by 2013. Route 7 is also planned for expansion from four to six lanes between Reston Parkway and the Dulles Toll Road by 2009, and Rolling Holly Drive and Reston Parkway by 2015.

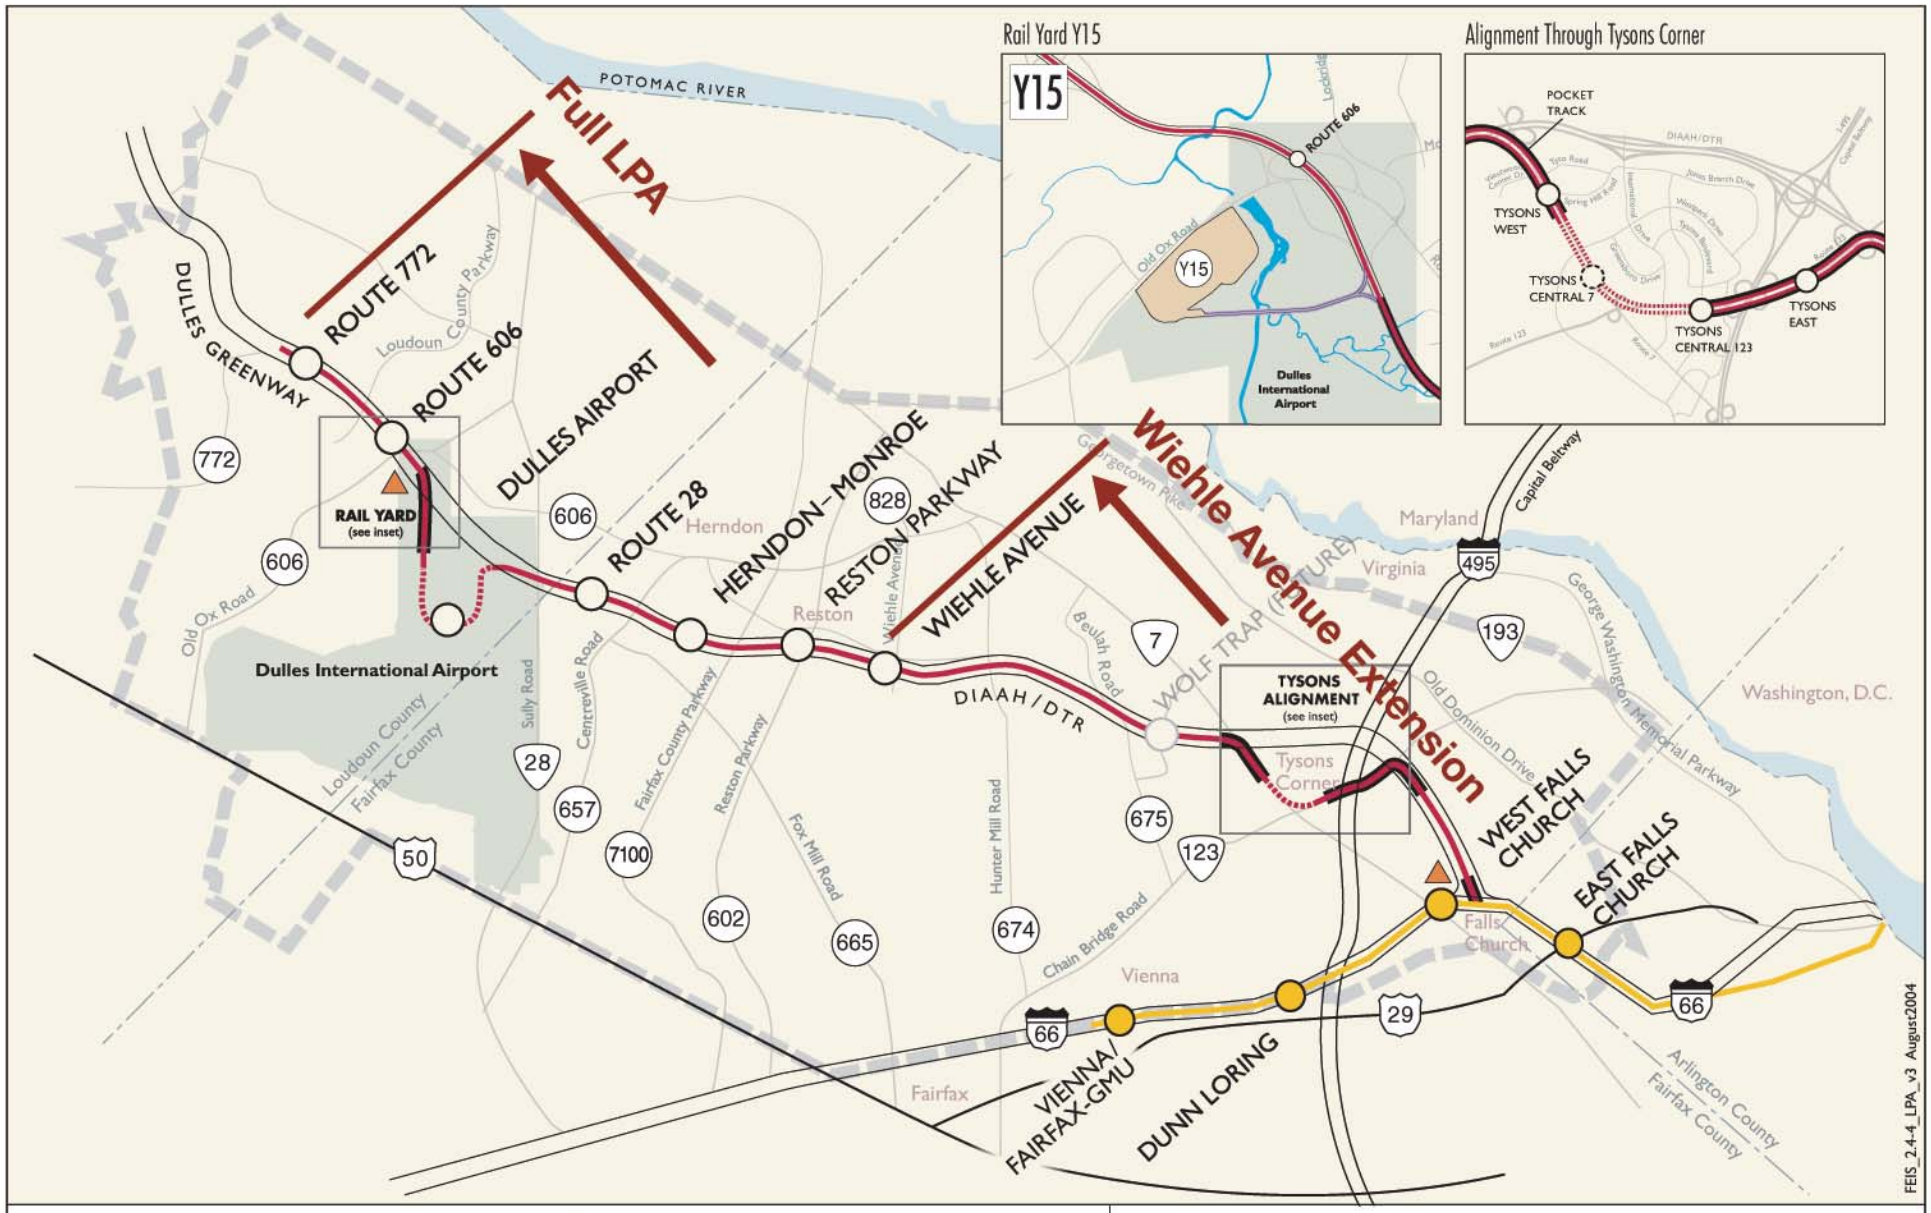
Route 123 (Chain Bridge Road/Dolley Madison Boulevard) – This is a four- to six-lane facility linking Tysons Corner with the communities of McLean to the east and Vienna to the west. Within Tysons Corner, Route 123 is planned for expansion from six to eight lanes between Route 7 and I-495 by 2010.

Route 193 (Georgetown Pike) – This is a two- to four-lane facility connecting Route 123 in eastern McLean with Route 7 in Great Falls. Route 193 serves as the northern boundary of the corridor study area.

Route 7100 (Fairfax County Parkway) – This is a four-lane arterial that runs north-south through the corridor study area between I-66 and Route 7. Route 7100 is planned for expansion from four to six lanes between I-66 and Sunrise Valley Drive by 2015. Additional lanes will function as HOV lanes in the peak period.

Route 28 (Centreville Road/Sully Road) – This is a six-lane, north-south arterial running parallel to the eastern boundary of Dulles Airport between Route 50 and the Dulles Toll Road, continuing north to Route 7. Several improvements are planned on Route 28 within the corridor by 2015, including widening the road to eight lanes and upgrading it to a freeway between Route 7 and I-66. New or upgraded grade-separated interchanges at Route 625, Sterling Boulevard, Route 606, McLearen Road, the National Air and Space Museum, and Westfields Boulevard are expected to be complete by 2006.

Route 50 (Lee-Jackson Memorial Highway) – This is a four- to six-lane, east-west arterial running between I-66 and Route 28, forming the far southwest boundary of the corridor study area.



Loudoun County Parkway – This is a two- to four-lane, north-south roadway, which will link the Dulles Greenway and Route 7, and be widened to a four- to six-lane facility, by 2007. The road will also be extended south, connecting the Greenway to I-66 and Route 234. This southern extension is expected to be complete by 2025.

2.4.2 LOCALLY PREFERRED ALTERNATIVE

2.4.2.1 Introduction

The LPA for the Final EIS generally follows an alignment between the Metrorail Orange Line near the West Falls Church Station and Route 772 in Loudoun County, using the median of the Dulles Connector Road, the DIAAH, and the Dulles Greenway (see Figure 2.4-3). The alignment diverges from these routes to serve Tysons Corner and Dulles Airport. The LPA would include 11 new stations, as well as ancillary facilities, such as a new Metrorail S&I Yard on Dulles Airport property, traction power substations, tie-breaker stations, and stormwater management ponds.

Initially, Metrorail service would be provided from the existing Orange Line (between the East Falls Church and West Falls Church stations) through Tysons Corner to Wiehle Avenue (the Wiehle Avenue Extension) (see Figure 2.4-4). Interim express bus service, operated by Fairfax and Loudoun counties, would be provided between Wiehle Avenue and the western portion of the corridor. It is anticipated that the Wiehle Avenue Extension would begin operations in 2011. As part of the full LPA, Metrorail service would be extended west of Wiehle Avenue to Dulles Airport and Loudoun County and is expected to begin operations by 2015.

Figure 2.4-3

Locally Preferred Alternative

Dulles Corridor Rapid Transit Project

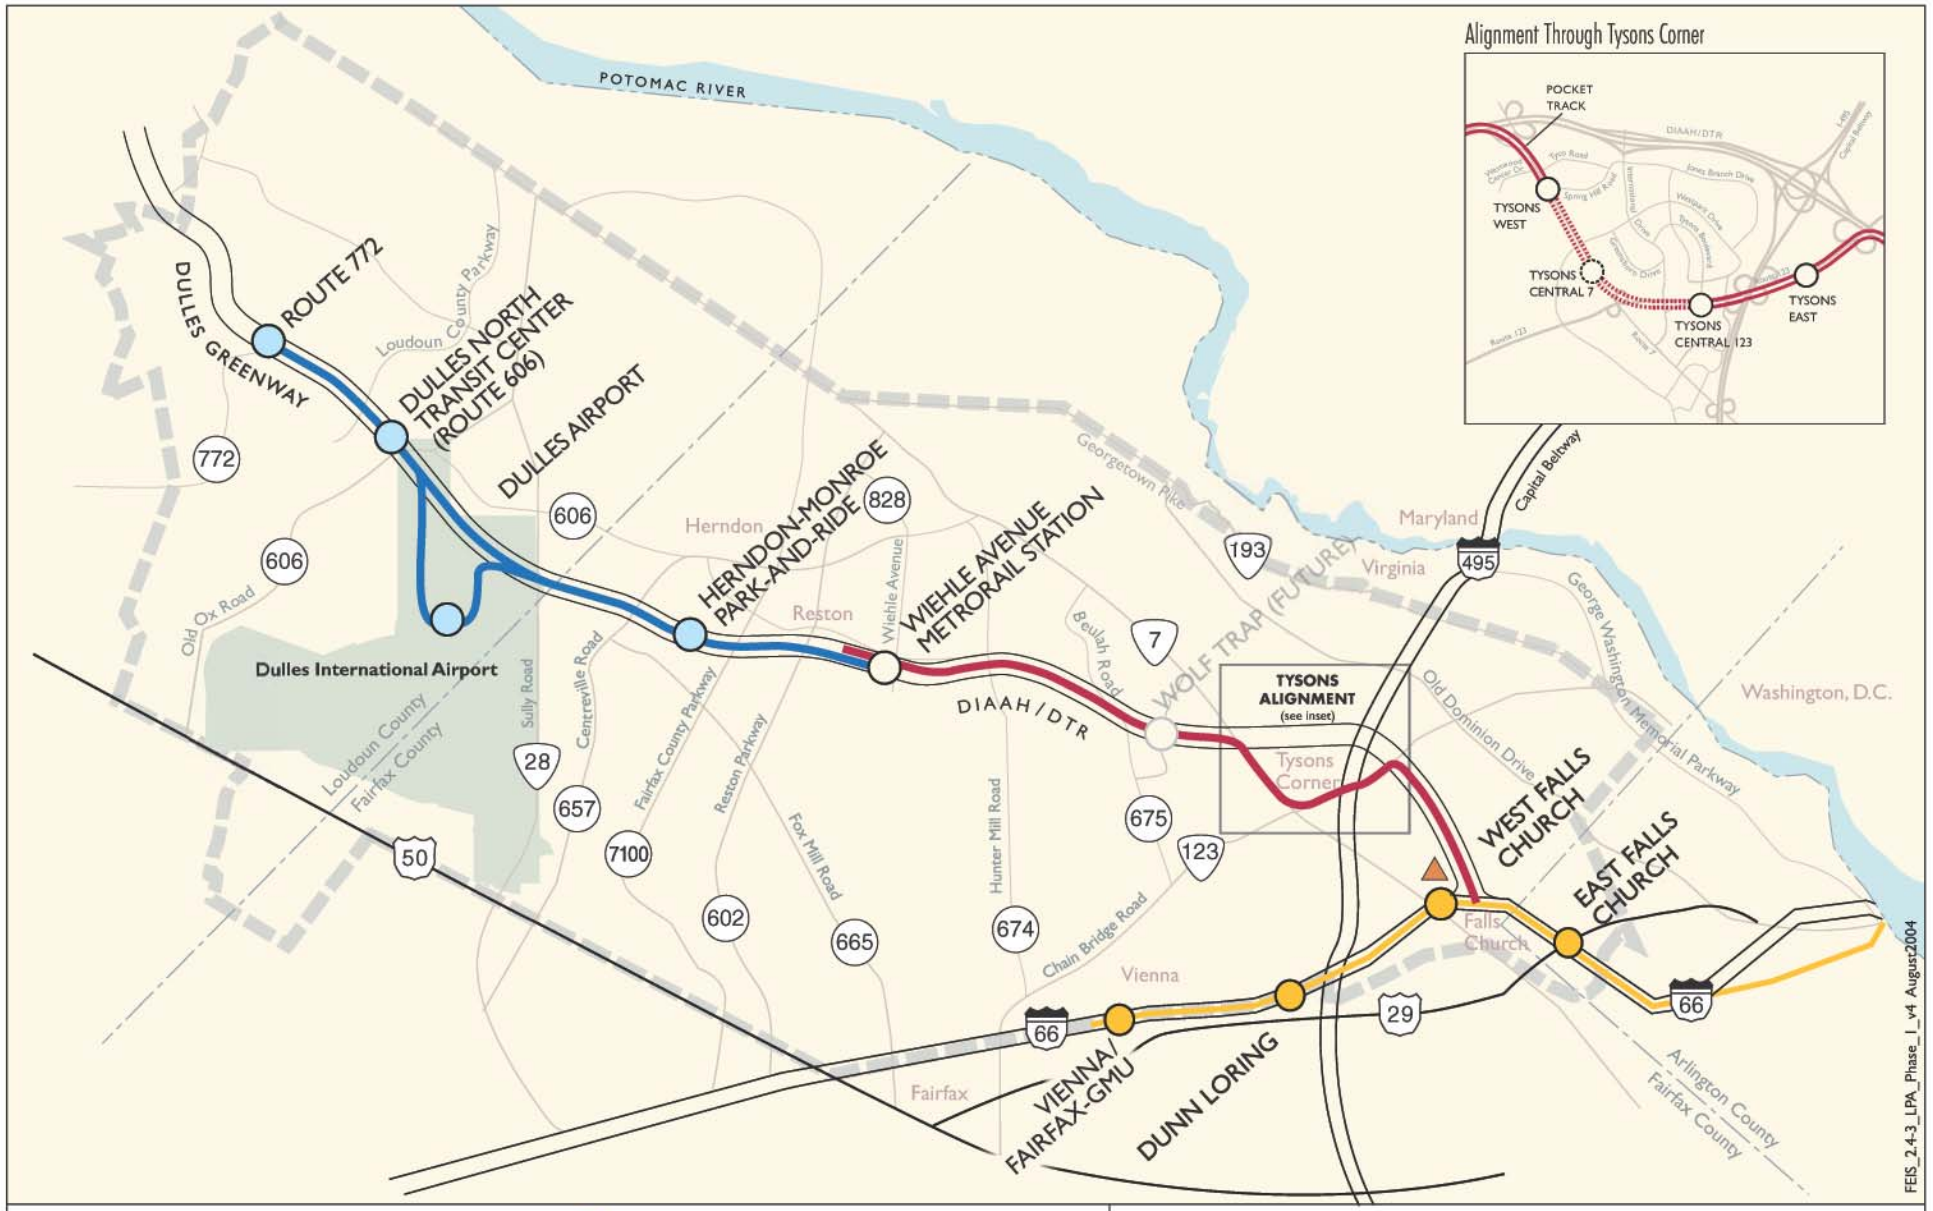

Figure 2.4-4

Wiehle Avenue Extension

Dulles Corridor Rapid Transit Project

This implementation schedule assumes that the remainder of Federal funding for the Wiehle Avenue Extension is provided in the pending Congressional transportation reauthorization; that Federal funding for the remainder of the LPA is provided in the subsequent transportation reauthorization; that all State and local funding is fully available when needed to meet the construction schedule; that there would be timely FTA approvals to advance to final design and construction for each phase; and that Virginia's design-build approach Public-Private Transportation Act of 1995 (PPTA) for project delivery would be used. The schedule for the Wiehle Avenue Extension and full LPA requires a period of up to 12 months for DRPT conveyance, WMATA acceptance, and WMATA operations start-up and testing, after substantial completion of PPTA construction activities. A more detailed implementation schedule will be developed during preliminary engineering for each project phase.

A. The Wiehle Avenue Extension Summary

Metrorail stations associated with the Wiehle Avenue Extension would include the following:

Tysons East Station would be an aerial facility located at the intersection of Scotts Crossing Road/Colshire Drive and Route 123.

Tysons Central 123 Station would be an aerial facility located in the central core of Tysons Corner at the intersection of Route 123 and Tysons Boulevard.

Tysons Central 7 Station would be an underground facility located near the Pike 7 Plaza between the Route 7/Westpark Drive intersection and the Route 123/Route 7 interchange.

Tysons West Station would be an aerial facility located on Route 7 between Westwood Center Drive/Tyco Road and Spring Hill Road.

Wiehle Avenue Station would be an at-grade facility in the median of the DIAAH west of the Wiehle Avenue overpass.

For the Wiehle Avenue Extension, the Wiehle Avenue Station would serve as an interim terminal station. The number of bus bays at the station would be increased, and Kiss & Ride spaces may be increased. No additional long-term parking would be provided for the interim terminal station beyond the 2,300 spaces included in the full LPA. The Wiehle Avenue Extension would include construction of interim tail tracks with a pocket track located west of Wiehle Avenue Station.

The Wiehle Avenue Extension would operate with a mix of six- and eight-car trains at approximately seven-minute headways during the peak period (eight to nine trains per hour), and four-car trains at 12-minute headways in the off-peak period (five trains per hour). To accommodate these operations, the Wiehle Avenue Extension would require improvements to the West Falls Church S&I Yard including construction of eight storage tracks and expansion of the maintenance building. Improvements to the maintenance building include the addition of two service tracks with four maintenance bays, which can service up to eight rail cars. Improvements at West Falls Church S&I Yard would also include a new yard lead from the Dulles Corridor Metrorail line and construction of a sound attenuation box over the existing yards loop track and a portion of the new yard lead. All improvements would be developed within the public right-of-way.

The Wiehle Avenue Extension would also include express bus service between Wiehle Avenue Station and transit centers/stops in the western end of the corridor, providing a level of service meant to closely

replicate Metrorail service. Five routes or route families would provide service at frequencies comparable to Metrorail headways to the following stations/stops:

Wiehle Avenue Station would be an at-grade facility in the median of the DIAAH west of the Wiehle Avenue overpass.

Reston Town Center Transit Center is a new transit center by Fairfax County on the south side of Bluemont Drive, between Explorer Street and Library Street.

Herndon-Monroe Park-and-Ride is an existing facility located adjacent to the Dulles Toll Road between the Fairfax County Parkway and Monroe Street overpasses.

Dulles Airport Stop would consist of a curbside bus stop located along the existing ground transportation roadway in front of the terminal.

Dulles North Transit Center is an existing facility located north of the Dulles Greenway near the Route 606 interchange.

Route 772 Stop would consist of a curbside stop and a 300 space park-and-ride facility located along new roadways to be provided by development. In combination with the existing 750 spaces located at the adjacent Dulles North Transit Center, total parking after the completion of the Wiehle Avenue Extension would be 7,632 spaces.

The Wiehle Avenue Extension would also include operating plans for bus routes feeding into rail stations within the corridor, as well as regional routes running the full length of the corridor.

B. Full LPA Summary

Completion of the full LPA would extend Metrorail service from Wiehle Avenue Station through Dulles Airport to Route 772 in Loudoun County (see Figure 2.4-4). Metrorail operations for the full LPA would be the same as those for the Wiehle Avenue Extension. The following stations would be developed during the second phase of construction:

Reston Parkway Station would be an at-grade facility located in the median of the DIAAH, west of the Reston Parkway overpass.

Herndon-Monroe Station would be an at-grade facility located in the median of the DIAAH adjacent to the existing Herndon-Monroe Park-and-Ride.

Route 28 Station would be an at-grade facility located in the median of the DIAAH, between Centreville Road and the Dulles Toll Road/Route 28 interchange.

Dulles Airport Station would be an underground facility located beneath the surface parking in front of the airport's main terminal.

Route 606 Station would be an at-grade facility located in the Greenway of the DIAAH, west of the Route 606/Dulles Greenway interchange.

Route 772 Station would be an at-grade facility located in the median of the Dulles Greenway, east of the Route 772/Dulles Greenway interchange.

Under the full LPA, the Herndon-Monroe Park-and-Ride facility would be expanded from the existing 1,750 spaces to 3,500 spaces by 2025. A new parking structure, with 2,000 spaces, would also be constructed at the proposed Route 606 Station for the full LPA. Total parking under the full LPA would be 16,382 spaces by 2025.

The new S&I Yard would be constructed on Dulles Airport property. The yard would occupy roughly 70 to 90 acres and would be designed for 250 rail vehicles but initially built for 184.

As shown in Figure 2.4-5, both construction phases would include construction staging areas at multiple locations throughout the Dulles Corridor, as appropriate to the portion of the alignment under construction.

2.4.2.2 Detailed Description of the LPA

This section provides a detailed description of the alignment and facilities associated with the Wiehle Avenue Extension and the full LPA. As described in previous sections, DRPT intends to construct the LPA in two major phases (see Figure 2.4-6). The Wiehle Avenue Extension would be constructed from the Metrorail Orange Line in the vicinity of the West Falls Church Station to Wiehle Avenue, which would function as an interim terminal station. The remainder of the LPA would be constructed from Wiehle Avenue Station to Dulles International Airport and Loudoun County. The Wiehle Avenue Extension is anticipated to be completed by 2011, and completion of the full LPA is anticipated by 2015.

A. The Wiehle Avenue Extension

This section provides a detailed description of the alignment and facilities included in the Wiehle Avenue Extension, as well as Metrorail operations and capital and operating costs associated with the alternative. Engineering and architectural drawings showing the LPA alignment, stations and facilities, including the phasing of construction, are presented in the *Final General Plans Line and Systems & Facilities, FEIS Volumes IV and V* (General Plans). The Metrorail operating plan reflects the WMATA Capital Improvement Plan (November 2002), described in Section 1.3.2.2, and thus differs from the operating plan of the Supplemental Draft EIS.

The Wiehle Avenue Extension Metrorail Alignment and Stations

The Wiehle Avenue Extension would connect to the Orange Line between the East Falls Church and West Falls Church stations. The tracks would diverge from the Orange Line tracks on flyover structures, turning north and first passing over the westbound lanes of I-66, then over the outbound bus ramp between the West Falls Church Station and the Dulles Connector Road. The tracks would continue on an aerial structure to the median of the Dulles Connector Road, returning to grade just south of Idylwood Road.

The Wiehle Avenue Extension would diverge from the Dulles Connector Road at the Route 123 interchange, transitioning to an aerial structure near Chain Bridge Road and passing through the Route 123 interchange on flyover bridges. The aerial alignment then proceeds along the north side of Route 123 to the Capital Beltway, with an aerial station (Tysons East Station) located in the northwest quadrant of the intersection of Scotts Crossing Road/Colshire Drive and Route 123. The Tysons East Station would be accessible from the street level on the north side of Route 123, and from a pedestrian bridge touching down on the south side of Route 123 near Colshire Drive. The station facilities along Colshire Drive would include bus bays and Kiss & Ride spaces.

Figure 2.4-6

Schematics of Alternatives

Dulles Corridor Rapid Transit Project

From the Tysons East Station, the Wiehle Avenue Extension alignment would proceed west, passing over the Capital Beltway and continuing to the core of Tysons Corner. The alignment would include two stations in the central core of Tysons Corner: Tysons Central 123 and Tysons Central 7. Neither of these stations would have Kiss & Ride or park-and-ride facilities, because the stations are intended to facilitate pedestrian access to and from the surrounding activity centers in the core of Tysons Corner and reduce automobile dependence.

The Tysons Central 123 Station would be located along Route 123 at the intersection with Tysons Boulevard and would operate partially aerial and partially on retained fill. The station would have two entrances, one in the northwest quadrant of the intersection of Tysons Boulevard and Route 123 and one at Tysons Corner Center mall on the south side of Route 123. The north station facilities would include bus bays and a new bus-only turn lane along the west side of Tysons Boulevard. The south station facilities would include bus facilities on the north side of the mall to provide feeder bus service to the station.

The Wiehle Avenue Extension alignment would transition underground approximately 400 feet west of the Tysons Central 123 Station. It would travel underground along the north side of Route 123 to the Route 123/Route 7 interchange, curve westward, and then continue underground along the south side of Route 7 to the Tysons Central 7 Station. The Tysons Central 7 Station would be underground near Pike 7 Plaza on the south side of Route 7, between the Route 7/Westpark Drive intersection and the Route 123/Route 7 interchange. The station would be approximately 75 feet below ground with entrances on the north and south sides of Route 7. Underground walkways would provide access to the station. The Tysons Central 7 Station does not include off-street bus bays.

West of Westpark Drive, the Wiehle Avenue Extension would transition from an underground to an aerial alignment, running along the south side of Route 7 to an aerial station, Tysons West Station, at the western edge of Tysons Corner. The Tysons West Station would be located on the south side of Route 7 between Westwood Center Drive and Spring Hill Road with station entrances at the south end of the station near Spring Hill Road with a pedestrian overpass over Route 7. Bus bays and the Kiss & Ride would be located between Tyco Road and Spring Hill Road, with access into the facilities via Tyco Road. This would be a new entrance and would be protected by a new traffic signal on Tyco Road.

A 500-space park-and-ride facility may be constructed near the bus bays and short-term parking as part of future redevelopment. The specific location and design of the park-and-ride facility is not known at this time. The Tysons West Station would also include a pocket track west of the station platform. Pocket tracks are located between the main tracks and are used to store out-of-service trains or equipment, and to provide trains turn-around capability for short-run service.

West of the Tysons West Station, the Wiehle Avenue Extension aerial alignment would continue along Route 7. At the DIAAH, the alignment would pass over the interchange ramps and continue west on the DIAAH, transitioning to grade approximately 1,600 feet west of Route 7.

The Wiehle Avenue Extension would continue west at-grade in the median of the DIAAH. In the vicinity of Trap Road, the alignment would include provisions to accommodate a future median station at Wolf Trap National Park for the Performing Arts (Wolf Trap) to minimize the cost of construction and disruptions to transit operations should a station be built in the future. The initial design and construction of the Dulles Corridor Rapid Transit Project would incorporate a 1,700-foot-long section of retained fill to support the tracks.

The Wiehle Avenue Extension would continue at-grade in the DIAAH median to the Wiehle Avenue Station; a median station located approximately 500 feet west of the Wiehle Avenue overpass, where the Dulles Toll Road was previously realigned to accommodate a transit station. The DIAAH would be similarly realigned for the station and its tail tracks. Station facilities on the south side of the Dulles Toll Road would include five bus bays on the eastbound exit ramp, an entrance pavilion and a paved walkway extending from the pavilion to Wiehle Avenue. On the north side of the Dulles Toll Road, the pedestrian bridge would connect to station facilities including twelve revenue bus bays, Kiss & Ride spaces, and a multi-level park-and-ride structure with 2,300 spaces. The station facilities would use the Reston East Park-and-Ride and would be designed to accommodate future development. A second vehicular entrance to the station facilities would be provided by an extension of the present access road and conversion of a private road to public use.

Fairfax County will solicit joint development proposals that may modify the site plan of the station facilities but not the requirements of the bus bays, Kiss & Ride, and park-and-ride spaces.

The Wiehle Avenue Extension alignment would end at a point approximately 2,000 feet west of the Wiehle Avenue Station. This section includes tail tracks with pocket track.

The Wiehle Avenue Extension Metrorail Yard Facilities

The Wiehle Avenue Extension would include a new yard lead into the West Falls Church S&I Yard. The yard lead would connect to the loop track on the north side of the yard, extending eastward and passing under the eastbound travel lanes of the Dulles Connector Road before surfacing in the median of the Connector Road. Here, the lead would be located between the inbound and outbound revenue tracks.

In addition, for the Wiehle Avenue Extension, eight storage tracks would be added within the loop track of the existing West Falls Church S&I Yard, and a sound attenuation “cover box” would be constructed over the yard’s existing loop track and a portion of the new yard lead. The storage tracks would have the capacity to store 42 rail cars, with room to maneuver an additional 6 cars, for Metrorail operations in the Dulles Corridor. The Wiehle Avenue Extension would also require expansion of the maintenance building. Improvements to the maintenance building include the addition of two service tracks with four maintenance bays, which can service up to eight rail cars. Expansion of the maintenance building would require relocation of the current vehicle access road and construction of a retaining wall adjacent to the westbound lanes of I-66. Some employee parking, loading docks, and ramps would also be relocated within the yard. These yard improvements would be located within existing public right-of-way.

The Wiehle Avenue Extension Metrorail Ancillary Facilities

The Wiehle Avenue Extension would include additional ancillary facilities, such as traction power substations, tie-breaker stations, and stormwater management facilities. Traction power substations are typically one-story buildings of approximately 8,100 square feet that house facilities to supply direct current power for the rail system. Tie-breaker stations are one story buildings of approximately 900 square feet that house equipment to break the rail line into sections, allowing power in one or more sections to be shut down for maintenance without affecting the power supply to the rest of the system.

The traction power substations and tie-breaker stations included in the Wiehle Avenue Extension were sited based on systems engineering requirements, environmental, and right-of-way constraints. A power analysis was conducted to determine the number and size of substations required and the optimal spacing for these stations. Based on this analysis, the Wiehle Avenue Extension would include 11 traction power substations and 4 tie-breaker stations (see Figure 2.4-7).

Figure 2.4-7

Traction Power Substations, Tie Breaker Stations and Proposed Storm Water Management Facilities

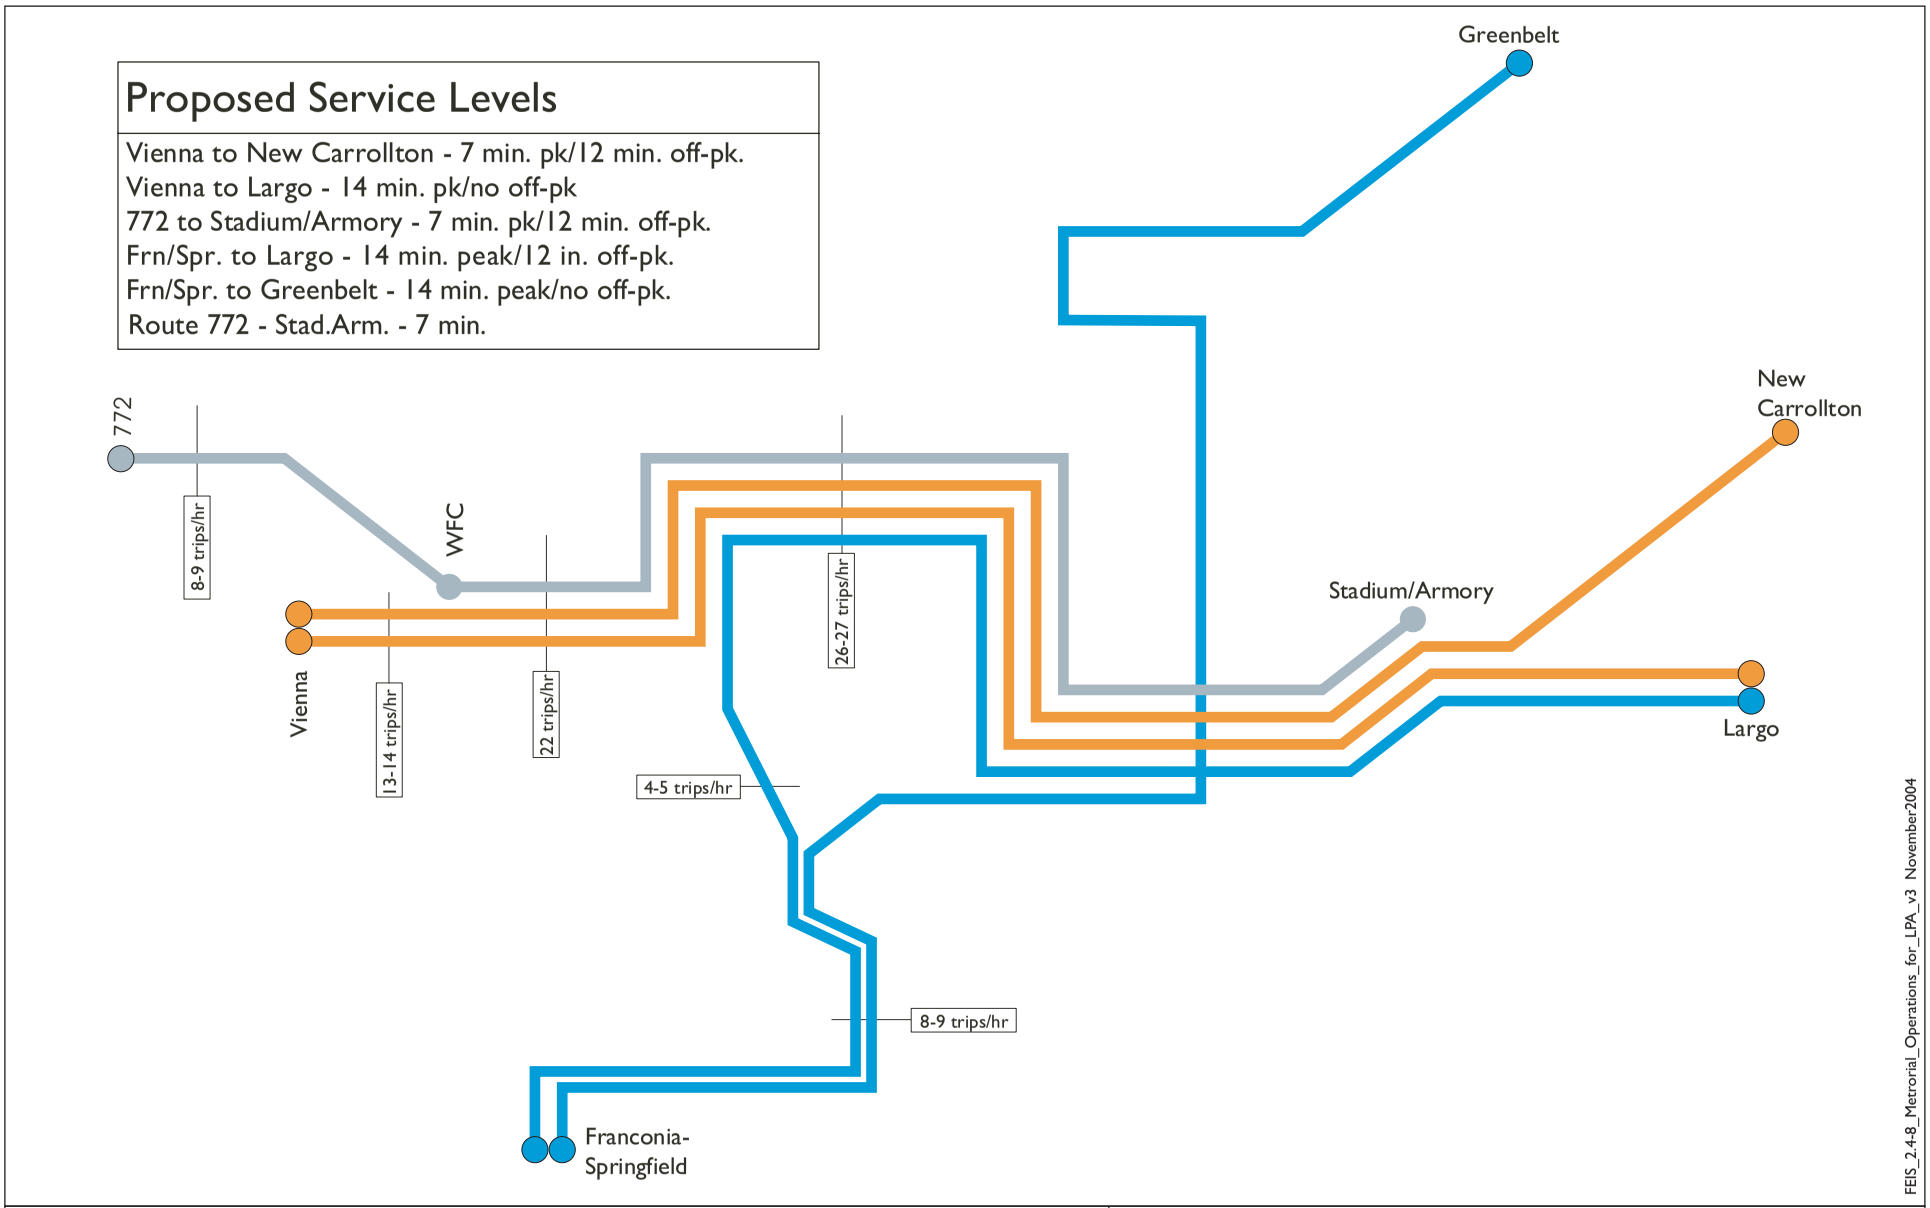
Dulles Corridor Rapid Transit Project

The Wiehle Avenue Extension would also require 11 stormwater management facilities, most located along the Dulles Toll Road. The locations of these facilities are also shown in Figure 2.4-7.

The Wiehle Avenue Extension Operations

The Wiehle Avenue Extension would include operating plans for trains running on the Dulles Line, on the existing Orange Line between Vienna and New Carrollton, and on the Orange Line between West Falls Church and New Carrollton. It would also include operating plans for bus routes feeding into rail stations within the corridor, as well as regional routes running the full length of the corridor.

Dulles Corridor Metrorail service would operate between Stadium-Armory Station on the Orange Line in the region's core and Wiehle Avenue in Fairfax County and would be integrated with the existing Orange Line service.



Orange Line trains currently operate between Vienna and New Carrollton on six-minute headways (ten trains per hour) in the peak hours (6:00 to 9:30 a.m. and 3:30 to 6:30 p.m. weekdays) and 12-minute headways (five trains per hour) during off-peak hours, except after 10 p.m., when trains run every 20 minutes. Orange Line service is supplemented by a peak-hour service in the morning and afternoon peak direction, to provide extra capacity during the "peak of the peak" when the heaviest passenger volumes on the Orange Line occur. These supplemental trains, or "trippers," also operate with six-minute headways (ten trains per hour), some between Vienna and New Carrollton and some between West Falls Church and New Carrollton. The combination of Orange Line, Blue Line, and tripper service results in approximately 29 to 30 trains per hour through the Rosslyn portal into the region's core in the a.m. and p.m. peak hour (for a combined two-minute headway, on average).

In the future, peak period service on the Orange and Blue lines would be reduced to approximately seven-minute headways (eight to nine trains per hour), and approximately half of the Blue Line trains would be diverted to the Yellow Line, resulting in four to five Blue Line trains per hour continuing to Rosslyn. When operations begin on the Dulles Corridor line, supplemental Orange Line service would be discontinued and Dulles Corridor trains would operate with approximately seven-minute headways. The combination of Orange Line, Blue Line, and Dulles Corridor service would result in approximately 26 to 27 trains per hour through the Rosslyn portal during peak periods (approximately two- to three-minute headway, on average) (see Figure 2.4-8). During the off-peak hours and over weekends, Orange Line, Blue Line, and Dulles Corridor service would run on 12-minute headways (five trains per hour).

Dulles Corridor service would be different than the existing supplemental service because it would enter the Orange Line between the West Falls Church and East Falls Church stations and would terminate at the Stadium-Armory Station rather than running all the way to New Carrollton, as the supplemental service now does. Moreover, this service would operate in both directions throughout the entire day, as opposed to operating only in the peak direction during the peak hour, as is the case today.

In the peak period of the opening year of 2011, Orange Line, Blue Line and Dulles Corridor service would operate with a mix of six- and eight-car trains. In the off-peak period, Dulles Corridor and Blue Line service would use four-car trains, and the Orange Line would use a mix of four- and six-car trains. Service would operate during the same hours of the day as current Metrorail service. The Dulles Corridor service would not require changes to the existing Metrorail system that are not included in the No Build Alternative. The No Build has changes funded by the Metro Matters, namely eight-car train operations.

This Page Intentionally Left Blank

LEGEND

- Orange Line
- Blue Line
- Silver Line

Figure 2.4-8

Metrorail Operations for LPA (2025)

Dulles Corridor Rapid Transit Project

The Wiehle Avenue Extension would also include an interim, more express bus service for the western end of the corridor to provide enhanced transit service to travelers that would be ultimately served by the full LPA. The operating plan would consist of several routes that provide connections between Wiehle Avenue Station, Herndon-Monroe transit center, Dulles Airport ground transportation, Dulles North transit center and a new transit center in the locale of the future Route 772 Station. Service would have frequencies comparable to proposed Metrorail headways. These routes would feed the interim terminal station at Wiehle Avenue and in lieu of service to Reston Parkway, the operating plan for express bus service would connect to the planned transit center at Reston Town Center. No service would be provided to the Route 28 Station included in the full LPA because access to the proposed station facilities from the highway is indirect, making it very difficult to serve this area effectively with rail-like bus service.

The feeder and corridor bus network for the Wiehle Avenue Extension consists of a complex system of routes that would be run by WMATA, Fairfax County, Loudoun County and possibly MWAA's Washington Flyer. The routes operated by each provider are shown in Figure 2.4-1 in Section 2.4.1 for the No Build Alternative. The existing bus network would be modified to accommodate the Wiehle Avenue Extension. Several routes would be realigned to provide better service to the proposed Metrorail stations in the corridor, and numerous routes would be eliminated and replaced by the modified routes or the Wiehle Avenue Extension service. The service frequencies would be modified for other routes to be more consistent with the new transit service in the corridor, reduce duplication of service, and in some cases to better coincide with Metrorail headways.

The Wiehle Avenue Extension Construction Activities

The Wiehle Avenue Extension would connect with the Orange Line at a point between the East and West Falls Church Metrorail stations. This connection would require new special track work including turnouts and a double crossover, and some realignment of the existing Orange Line track. Due to the proximity of the new track construction to the eastbound lanes of I-66, during construction there may be limited closures of the inside shoulder and potentially the inner lanes of I-66 during off-peak and overnight periods. WMATA would be able to maintain Orange Line operations by single-tracking trains to implement such improvements. If construction would require closure of both tracks, most likely on weekends, then bus service would be provided between East Falls Church and West Falls Church stations.

Improvements at the West Falls Church S&I Yard would affect yard operations during construction. In addition, yard modifications would require work within the north concrete embankment of I-66; however, use and conveyance of I-66 right-of-way would not preclude potential improvements for I-66. The new yard lead for the Wiehle Avenue Extension would cross under the eastbound lanes of the Dulles Connector Road and connect to the Dulles main line in the median of the Connector Road (roughly 1,000 feet north of the West Falls Church Station). Construction of this lead track would most likely use a cut-and-cover technique that would require building a Dulles Connector Road temporary detour for the eastbound lanes.

At the eastern edge of Tysons Corner, construction of the aerial structure transitioning from the Dulles Connector Road to Route 123 would require temporary lane closures on both the Connector Road and Route 123. The pier placements for the aerial structure crossing Route 123 will be coordinated to not preclude future improvements to Route 123.

In Tysons Corner, the Wiehle Avenue Extension requires 1.1 miles of underground structure (including the Tysons Central 7 Station). This underground section may be mine-tunneled or excavated using cut-

and-cover techniques, except at the underground station, which would be constructed with cut-and-cover techniques only. Maintenance of traffic plans for cut-and-cover construction would require significant staging to limit extended lane closures and keep as many lanes open to traffic as possible. Temporary roadways, structures, and detours may be required to direct traffic through this area during construction along Route 7. Construction of the western portal for the underground section would require detouring the service roadway adjacent to Route 7 during construction and realigning the service road after the portal is built.

Construction of feeder bus bays and Kiss & Ride facilities associated with the Tysons Corner area Metrorail stations is expected to have minimal impacts. Construction of Kiss & Ride and bus facilities on the south side of Route 123 at the Tysons East Station may require occasional lane closures on Route 123 and Colshire Drive. At Tysons Central 123 Station, the construction of the bus bays and the bus lane on the north side of Route 123 may require brief closures of some lanes of Route 123 and Tysons Boulevard. Similarly, construction of facilities at the Tysons West Station could require occasional lane closures on Tyco Road. For all stations in Tysons Corner, construction of pedestrian bridges would include some temporary closures of lanes in the vicinity of stations. The construction of the aerial flyover segment across the eastbound lanes of the DIAAH and Dulles Toll Road would also involve limited partial closures of these roadways.

Construction of the Wiehle Avenue Extension between the DIAAH/Route 7 interchange and Wiehle Avenue would require DIAAH realignment at both the Wiehle Avenue Station and its tail track. Realignment activities, as well as construction of pedestrian bridge and station site facilities, would require occasional lane closures along the DIAAH. West of the Wiehle Avenue Station, construction of facilities for express bus service would have limited transportation effects. The Route 772 transit center would have no significant construction effect. In the long-term, if the LPA is not implemented in its entirety, the expansion of parking at the Herndon-Monroe Park-and-Ride could cause temporary disruptions to adjacent roadways and access to these facilities. Additional bus facilities at Dulles Airport would have minor disruptions to adjacent roadways.

The Wiehle Avenue Extension Costs

The estimated total capital costs (excluding any required financing costs) of the Wiehle Avenue Extension are approximately $1.5 billion (Year of Expenditure [YOE]). The incremental annual operations and maintenance costs for the Wiehle Avenue Extension in 2011 and 2025 (over the No Build Alternative) are estimated to be $47.47 million and $67.64 million in YOE, respectively. The costs for the Wiehle Avenue Extension would be less than those for the full LPA due to the shorter alignment under this phase.

B. Full LPA

This section provides a detailed description of the alignment and facilities included in the full LPA, as well as Metrorail operations and capital and operating costs associated with the alternative. Engineering and architectural drawings showing the full LPA alignment, stations and facilities, including the phasing of construction, are presented in the *General Plans: Line and Facilities, July 2004, FEIS Volume IV and V* (General Plans).

Full LPA Metrorail Alignment and Stations

The full LPA Metrorail alignment, stations and facilities are the same as those described for the Wiehle Avenue Extension for the area east of and including the Wiehle Avenue Station.

From the Wiehle Avenue Station, the full LPA would proceed west, at-grade in the median of the DIAAH, with median stations at Reston Parkway, Herndon-Monroe, and Route 28. There would be small areas of cut and fill along the alignment, predominantly in the vicinity of these stations, to allow for level platforms. In addition, portions of the DIAAH would need to be realigned to accommodate the median stations. At Herndon-Monroe and Route 28, the Dulles Toll Road would be realigned once the DIAAH was widened to six lanes.

The Reston Parkway Station would be located where the Dulles Toll Road was previously realigned to accommodate a transit station, approximately 1,000 feet west of the Reston Parkway overpass. The station would include a pedestrian bridge to pavilions on the north and south sides of the Toll Road with feeder bus bays and Kiss & Ride spaces. No park-and-ride spaces would be provided at the Reston Parkway Station.

The Herndon-Monroe Station would be located east of the Monroe Street overpass. The project would provide a pedestrian walkway between Herndon Parkway and the north entrance pavilion. On the south side of the Dulles Toll Road, an entrance pavilion would be located at the existing Herndon-Monroe Park-and-Ride, which includes feeder bus bays, Kiss & Ride spaces, and a parking structure with 1,750 park-and-ride spaces. The structure would be expanded to approximately 3,500 spaces as part of the full LPA. The DIAAH realignment would cause the reconstruction of one pier and two spans of the existing bridge that serves Herndon-Monroe.

The Route 28 Station would be located east of the Dulles Toll Road/Route 28 interchange, north of the proposed Dulles Station development along Fox Mill Road. Fairfax County has proposed an overpass at a location just west of the station site. The location of this future overpass has been coordinated with Fairfax County to accommodate the entrance pavilions for the station. Station facilities on the north side of the Dulles Toll Road would include feeder bus bays and Kiss & Ride facilities. The facilities on the south side would cover a larger area and would include bus bays, Kiss & Ride spaces, and a park-and-ride structure of 2,000 spaces.

At Dulles Airport, the full LPA would transition underground in the median of the DIAAH west of the Route 28 overpass. The underground alignment would turn south toward the terminal, then turn west to access an underground station located in front of the terminal and under its surface parking lot, then turn north and rise to the surface, transitioning to an aerial structure between Package Court and Rudder Road. The elevated tracks would follow Autopilot Drive, heading toward the northwest corner of Dulles Airport property and the Dulles Greenway in the vicinity of Route 606. This section includes an aerial pocket track.

The underground station at the airport terminal will be designed to not preclude future construction of a station for an airport landside people-mover planned by MWAA. Access to the Metrorail station mezzanine would be provided via existing pedestrian tunnels that extend from the center of the existing terminal to the parking structure north of the surface parking lot.

In Loudoun County, the full LPA would extend along the Dulles Greenway to a point near the Route 772 interchange. From the Dulles Airport area, the alignment would transition to grade in the median of the Greenway just east of the Route 606 overpass. The at-grade tracks would extend westward, crossing Broad Run on an elevated structure between the existing Dulles Greenway bridges. The tracks would continue westward to the west side of the Route 772 overpass. A tail track, which would be available for

storage and maneuvering of vehicles outbound of the Route 772 Station, would extend beyond the Route 772 overpass.

The full LPA's two stations along the Dulles Greenway would be located in the median, with pedestrian bridges connecting to station facilities. To accommodate these median stations, portions of the Greenway would need to be realigned.

The Route 606 Station would be located just west of the Route 606 overpass and the Dulles North Transit Center. The at-grade station would connect to new station facilities on the north side of the Greenway, including bus bays, Kiss & Ride spaces, and a park-and-ride structure of 2,000 spaces. In addition, the LPA would include a pedestrian connection to a proposed transit-related employment center north of the station facilities.

The Route 772 Station would be located one-half mile east of the Route 772 overpass and would connect to station facilities on the north and south side of the Dulles Greenway. Both the north and south facilities would include an entrance pavilion, a feeder bus loop, Kiss & Ride spaces, and a park-and-ride structure. Combined, the north and south parking structures would have 3,300 spaces. New roads, to be built by the sites' developers, would provide access to the station facilities.

Full LPA Metrorail Yard Facilities

Improvements at the West Falls Church S&I Yard would be the same as those discussed for the Wiehle Avenue Extension. In addition, the full LPA includes a new Metrorail S&I Yard, located south of Route 606 and west of Horsepen Lake. The site—evaluated as Site 15 in the Draft and Supplemental EIS—is on Dulles Airport property, north of an existing and a future runway. Approximately half of the site is within designated runway approach surfaces. To be consistent with MWAA policies, occupied buildings on the yard site would be located outside the approach surface.

S&I Yard Site 15, which would occupy roughly 70 to 90 acres, would be used for storage, maintenance, inspections, and repairs of Metrorail vehicles. The S&I Yard would be designed to accommodate 250 rail vehicles but initially built for 184. It would have several buildings, including an operations and field base building, a service and inspection shop, and a car wash. The yard would also include a traction power substation, a tie-breaker station, stormwater management facilities, and storage areas for materials. Metrorail vehicles would access the proposed yard sites via lead tracks from the mainline.

Full LPA Metrorail Ancillary Facilities

The LPA would include 21 traction power substations, 7 tie-breaker stations, and 24 stormwater management ponds. The locations of these facilities are shown in Figure 2.4-7.

Full LPA Metrorail Operations

Metrorail operations under the LPA would be similar to those discussed for the Wiehle Avenue Extension, except that service would be provided between the Stadium-Armory Station on the Orange Line and the Route 772 Station, and Dulles Corridor service would use a mix of six- and eight-car trains during the peak period and a mix of four- and six-car trains during the off-peak period.

Full LPA Construction Activities

Construction of the full LPA, east of and including the Wiehle Avenue Station, would be the same as the construction activities described for the Wiehle Avenue Extension. Construction of the full LPA beyond the Wiehle Avenue Station would require road realignment in the vicinity of the DIAAH median stations,

as well as construction of pedestrian bridge and station site facilities. These activities would occasionally close lanes in off-peak hours.

The full LPA would include an underground alignment at Dulles Airport with a portal well north of the terminal so as not to interfere with airport vehicular traffic. However, construction would displace parking spaces close to the airport terminal during construction of the underground station and alignment. The current assumption is that construction would proceed using cut-and-cover methods. Under this approach, construction would affect parking, some vehicular and pedestrian traffic, and the Signature Flight Support facilities. Minor disruptions would be expected to continue for at least two years. Temporary roadways, structures, and detours will be used during this period to maintain traffic. The possibility of using mined-tunneling methods for constructing the underground alignment will be studied during preliminary engineering. Regardless of which method is selected for the underground alignment, the underground station is likely to be constructed using the cut-and-cover method.

The western end of the Dulles Airport section is an aerial segment with a pocket track and crosses from the airport property into the Dulles Greenway median. Construction of this elevated structure is not anticipated to impact Greenway operations except for minimal off-peak lane closures of eastbound lanes during work over and adjacent to this area.

Realignment of the lanes on the Dulles Greenway would be necessary around the Route 606 and Route 772 stations and where the yard lead tracks connect, possibly causing some disruption of traffic. If the Dulles Greenway were realigned to accommodate stations prior to construction of the Route 606 and Route 772 stations, temporary lane closures along the Dulles Greenway would be minimized during construction of these stations.

Full LPA Costs

The estimated total capital costs (excluding any required financing costs) of the full LPA are estimated to be $3.5 billion (YOE). The incremental annual operations and maintenance costs for the LPA in 2015 and 2025 (relative to the No Build Alternative) are estimated to be $93.92 million and $117.88 million, respectively, in YOE dollars, respectively.

2.4.3 COMPARATIVE EVALUATION OF ALTERNATIVES

All the alternatives have been evaluated for the forecast horizon year of 2025. Because certain predicted effects of the Wiehle Avenue Extension vary depending on the year in which they are analyzed, the impacts and benefits of the Wiehle Avenue Extension are described for both opening year (2011) and the forecast horizon year (2025) to facilitate comparison across all alternatives.

Table 2.4-1 summarizes the major characteristics of these alternatives. The alignment, stations, ancillary facilities, operational characteristics, and costs associated with each of the alternatives are discussed in more detail in the following sections.

Table 2.4-1: Alternatives Evaluated

Characteristics	No Build Alternative (2025)	Locally Preferred Alternative		
		Wiehle Avenue Extension Opening Year (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
New Metrorail Line	–	11.6 miles	11.6 miles	23.1 miles
New Metrorail Stations	–	5	5	11
Yard Facilities	–	Improvements to West Falls Church S&I Yard	Improvements to West Falls Church S&I Yard	Site Y15 and Improvements to West Falls Church S&I Yard
Ancillary Facilities	–	11 substations, 4 tie-breaker stations, 11 stormwater facilities	11 substations, 4 tie-breaker stations, 11 stormwater facilities	21 substations, 7 tie-breaker stations, 24 stormwater facilities
Metrorail Operating Characteristics	7 minute peak period service	7 minute peak period service	7 minute peak period service	7 minute peak period service
	12 minute off- peak period service	12 minute off- peak period service	12 minute off- peak period service	12 minute off- peak period service
Capacity and Reliability Improvements to Metrorail System	8-car train operations, line reconfiguration, longer headways	No improvements beyond those included in the No Build Alternative	No improvements beyond those included in the No Build Alternative	No improvements beyond those included in the No Build Alternative
Express Bus Service	Fairfax and Loudoun Counties planned transit improvements (Express Bus) in the Dulles Corridor to West Falls Church Station	More Express Bus Service provided between Wiehle Avenue and points west	More Express Bus Service provided between Wiehle Avenue and points west	No Express Bus Service provided
Highway	Existing highways and planned highway improvements through 2025 included in the 2003 update of the MWCOG constrained long-range transportation plan (CLRP)	No improvements beyond those included in CLRP	No improvements beyond those included in CLRP	No improvements beyond those included in CLRP
Other Bus Service	Existing Metrobus, Fairfax Connector and Loudoun County Bus Services; marginal increases in local transit service to meet demand	Bus Service improvements provided	Bus Service improvements provided	Bus Service improvements provided

Table 2.4-2 provides a summary of the anticipated effects of the alternatives evaluated in the Final EIS. Results are summarized for the No Build Alternative and the LPA, including the Wiehle Avenue Extension. These effects and proposed mitigation measures are discussed in more detail in Chapters 3 through 9. Table 2.4-3 provides a summary of mitigation measures proposed to address the anticipated effects identified in Table 2.4-2.

Table 2.4-2: Summary of Effects

	No Build Alternative (2025)	Locally Preferred Alternative		
		Wiehle Avenue Extension Opening Year (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)

1 Average weekday riders.

2 Includes 3,800 express bus riders with no transfer to Metrorail.

3 "B" – Billions, "M" - Millions.

4 Non federal refers to monies that would come from local jurisdictions as well as the Commonwealth of Virginia.

5 Likely that resources destroyed by previous construction. Potential effects if resources remain.

6 Prime uplands include areas of mature or pristine deciduous or other forest types that support wildlife populations.

7 Planned mitigation measures will reduce impacts below FTA criteria.

8 Changes in population, employment, and development potential calculated for areas within 1/2-mile radius of proposed stations except in Tysons Corner, where a 1,600-foot radius was used. Changes added to totals for all TAZs in corridor.

9 LOS - Level of Service; Measure of performance of intersections: A being the best and F being the worst.

Table 2.4-3: Summary of Proposed Mitigation Measures

Area	Proposed Mitigation Measures
Land Use and Socioeconomics	Continue coordination with Fairfax County, Loudoun County and Town of Herndon to encourage appropriate transit-oriented development. Incorporate Tysons West park-and-ride requirements (500 spaces) into Fairfax County Comprehensive Plan. Assist Fairfax County in pursuing joint-development opportunities at the Wiehle Avenue station.
Neighborhood, Community Services, and Community Cohesion	See proposed mitigation measures for Noise, Visual, Traffic, and Construction effects.
Property Acquisition and Displacements	All property acquisitions would be conducted in accordance with the Uniform Relocation Assistance and Real Property Acquisition Act, as amended.
Visual and Aesthetic Conditions	Consider designs for Metrorail stations, aerial structures, and portals that are compatible with the surrounding environment. Provide landscaping at stations. Using established WMATA designs, design traction power substations and tie-breaker stations to be compatible with surrounding environment.
Cultural Resources/Section 4(f)	Lower the at-grade Metrorail alignment in the DIAAH median to preserve historic "peekaboo" view sequence of main terminal control tower. Develop treatment plan and implement specific measures (e.g., interpretive exhibits, public artwork, or photo documentation) to highlight Dulles Airport's unique historic characteristics. Consider the historic characteristics and other contributing elements of the Dulles Airport historic district in the design of the tunnel portals and their security barriers.
Parklands	Design and construct Metrorail overpass of the W&OD Railroad Regional Park in accordance with the *NVRPA Guideline for the Development of W&OD Trail Bridge Crossings*. Maintain use and access to the W&OD Railroad Regional Park during construction. Minimize disruption to Pimmit Run Stream Valley Park, Scotts Run Stream Valley Park, and Difficult Run Stream Valley Park during construction.
Safety and Security	Update WMATA Safety and Security Program with elements required by Transportation Security Administration or the Metropolitan Washington Airports Authority. Develop mutual aid agreements for emergency response with local jurisdictions. Locate tunnel exits of any kind, including vent shafts, emergency access shafts or any other kinds of openings outside the secure zone of the airport.
Environmental Justice	No mitigation measures are proposed.
Geological Resources	No mitigation measures are proposed.
Water Resources	**Surface Waters/Water Quality** Plant riparian buffers near the affected areas for two streams [Tributaries W-50 and W-51] converted to culvert or pipe. **Wetland Systems** Provide compensatory mitigation for unavoidable wetlands impacts associated with the S&I Yard on Dulles Airport property and at the Route 28 station by purchasing additional credits at an existing regional wetland bank. A 1:1 replacement ratio for impacts to emergent wetlands and 2:1 replacement ratio for impacts to forested wetlands would be used. **Floodplains** Avoid changes in floodplain elevation(s) of more than 1 foot. **Critical Areas** Coordinate design of new crossings with Fairfax and Loudoun Counties to ensure consistency with stream protection policies. **Other**

Area	Proposed Mitigation Measures
	Coordinate with the Federal Aviation Administration to ensure compliance with FAA Advisory Circular No. 150/5200-33 and control potentially hazardous wildlife from interfering with airport operations and safety.
Aquatic Biota and Habitat	See proposed mitigation measures for Water Resources, above.
Terrestrial Biota and Habitat	No mitigation measures are proposed.
Rare, Threatened, and Endangered Species	No mitigation measures are proposed.
Air Quality	No mitigation measures are proposed.
Noise	Install parapet and trackside noise barriers at locations near sensitive receptors to address noise impacts from Metrorail operations. Extend 4-foot noise barrier 1,000 feet near Baldwin Drive to reduce noise due to Metrorail passbys over 2 single switches west of Pimmit Run. Enclose new lead track and existing loop track at the West Falls Church Yard to reduce noise impacts from yard operations. Analyze reflective highway noise impacts to the Hallcrest Heights residential community during preliminary engineering and/or final design. Comply with WMATA guidelines, Federal law (for Wolf Trap Farm Park) and local noise ordinances during construction activities.
Vibration	Utilize dampening materials or devices under switches and crossovers near sensitive receptors.
Economic Effects	No mitigation measures are proposed.
Transportation Effects	**Station Access** Construct roadway improvements specified in the General Plans necessary for access to stations and facilities: *Tysons Central 123 Station* – Dedicated right turn lane for buses on Tysons Boulevard and acceleration lane on Route 123. *Wiehle Avenue Station* – New left turn lane northbound on Wiehle Avenue; new left turn lane to the eastbound Dulles Toll Road exit ramp at Wiehle Avenue; widen eastbound Sunset Hills Road between Wiehle Avenue and Isaac Newton Square and provide new left turn lane; and improve private roadway south of Sunset Hills Road to VDOT standards. New entry for bus ingress to the northside station facilities from the westbound Dulles Toll Road entry ramp; new acceleration lane for bus egress from the station facilities onto the westbound Dulles Toll Road; addition of bus bays on eastbound Dulles Toll Road exit ramp. *Route 606 Station* – New left turn lane to northbound Route 789 at both the north and south station entrances. *Yard Site 15* – New right turn and acceleration lanes on Route 606 for vehicular access to yard facilities. **Station Vicinity** Construct additional roadway improvements to mitigate opening year traffic impacts in the vicinity of Metrorail stations: *Tysons East Station* – Add second left turn lane from Old Meadow Drive to southbound Route 123. *Wiehle Avenue Station* – Improve right turn lane from eastbound Sunset Hills Road to southbound Wiehle Avenue and improve right turn lane from westbound Sunrise Valley Drive to northbound Wiehle Avenue. *Reston Parkway Station* – Add northbound through lane on Reston Parkway at Sunrise Valley Drive intersection and improve right turn lane from southbound Reston Parkway to westbound Sunrise Valley Drive. *Herndon-Monroe Station* – Add left turn lane from southbound Monroe Street to eastbound Sunrise Valley Drive; improve right turn lane from eastbound Sunrise Valley Drive to southbound Fairfax County Parkway; and modify lane configuration at the Van Buren (Monroe) Street and Herndon Parkway intersection.

Area	Proposed Mitigation Measures
	Route 606 Station – Add right turn lane from southbound Route 789 to westbound Route 606.
Secondary and Cumulative Effects	Any secondary or cumulative effects to the built and natural environment resulting from additional station area development would be mitigated through compliance with Fairfax and Loudoun counties' land use policies and development permitting processes.
Construction Effects	Develop Erosion and Sediment Control Plan. Develop Stormwater Management Plan and comply with applicable federal, state and local regulations and ordinances. Use Best Management Practices for stormwater management and groundwater protection during construction. Comply with federal, state, and local regulations governing construction in floodplains. Comply with the terms of the federal Coastal Zone Management Act consistency determination. Comply with local regulations governing noise and vibration during construction and use construction methods that minimize vibration. Comply with VDEQ requirements for fugitive dust and emissions outlined in 9 VAC 5-50-90. Prepare maintenance of traffic plans to address construction-related traffic management and detours. Maintain access (pedestrian and vehicular) to existing businesses during construction. Communicate with affected businesses and residents in order to minimize construction effects. Engage affected stakeholders to participate in the development of mitigation measures for construction effects and maintenance of traffic plans. Coordinate construction activities with VDOT for Commonwealth-owned roadways and MWAA for the Dulles Airport property, including the DIAAH. Comply with federal, state, and local regulations governing the use and handling of hazardous materials during construction.

3 SOCIAL EFFECTS

This chapter provides a general description of the existing demographics of the study area, and the living and working environments of people within it. The social aspects and built environment of the Dulles Corridor were studied in detail, and the project's No Build Alternative and the Locally Preferred Alternative (LPA) were analyzed to identify and assess the potential effects of each on the study area's population, housing, places of employment, land use, neighborhoods, and community services and facilities.

The alternative formerly known as "LPA Phase 1" in the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* has been renamed the Wiehle Avenue Extension in this Final EIS and is expected to begin operations in 2011. This change reflects the federal approach to the project's funding under the Federal Transit Administration's New Starts program. It will assure consistency among the environmental, engineering and financial documents during the project's development.

In the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* as well as this Final EIS, the term "full LPA" represents the Wiehle Avenue Extension and the second phase of the Dulles Corridor Rapid Transit Project. This second phase would extend west from Wiehle Avenue to Washington Dulles International Airport and Route 772 and is expected to begin operations in 2015.

The term "LPA", "proposed action", or "selected LPA" refers to both the Wiehle Avenue Extension and the full LPA collectively.

Each section in this chapter defines a study area, the methods used to make the assessments, and the existing conditions in each area. Study area definitions vary according to the issues under evaluation. For topics such as displacements and relocations, the study area is the limit of disturbance for the proposed improvements. For visual effects, the extent of the study area changes along the corridor depending on the nature of views and the locations of those viewsheds.

The LPA is evaluated against the No Build Alternative in terms of potential long-term and construction (short-term) effects and, where appropriate, measures to mitigate effects are identified. The assessment includes the following elements:

Section 3.1 provides a description of existing and planned land uses within the Dulles Corridor. Regional, county, and local land use characteristics are presented and corresponding regulations and county plans are described. In addition, projections of population, household, and employment growth due to land use changes in the corridor are assessed.

Section 3.2 provides a description of each neighborhood in the corridor and its associated community facilities (schools, places of worship, and recreation areas, etc.).

Section 3.3 provides a discussion of the residential, commercial, and institutional properties that are likely to be displaced or relocated by construction of the proposed alternatives.

Section 3.4 provides a description of the existing views and aesthetic conditions in the corridor and the potential of the alternatives to affect the visual character of the corridor.

Section 3.5 documents the historic and archeological resources in the study area. The discussion includes regulations that govern cultural resources, an overview of the history of the study area, identifies archaeological and historic resources within the study area, and the status of each resource. This section also presents the effects of each of the alternatives on these cultural resources.

Section 3.6 provides a physical and graphic description of the publicly owned parklands and recreation areas in the study area and assesses the potential effects of the proposed alternatives on these facilities.

Section 3.7 provides a description of the safety and security issues with the existing Metrorail system, and how these issues would be addressed for the LPA to provide a safe and secure environment for transit patrons in the Dulles Corridor.

In **Section 3.8**, to comply with Executive Order 12898, this section provides a description of minority and low-income populations, their location relative to the alternatives, and the results of the analysis. Particular focus is placed on any minority or low-income group or neighborhood that would be disproportionately affected by the project.

3.1 LAND USE AND SOCIO-ECONOMICS

As described in Chapter 1, population, housing, and employment in the Dulles Corridor are growing rapidly. This section discusses existing and future land use, major development activities, and land use controls within the Dulles Corridor. It also addresses changes in current land use that would result from the direct conversion of land within the corridor as well as changes in population, household characteristics, and employment that would occur in the corridor as land is developed. Changes in the corridor associated with increased densities or changes in the land use mix that are permitted under the *Fairfax County Comprehensive Plan* and the *Loudoun County Revised General Plan* if transit improvements are made, are discussed in Chapter 5.

3.1.1 METHODOLOGY

Potential changes in land use were determined by interpreting aerial photographs and reviewing comprehensive plans. Land use data provided by Fairfax and Loudoun counties were incorporated into a Geographic Information System (GIS) database for the project and then updated through field verification.

The study area for this analysis was defined as land within 300 feet of either side of the centerline of the No Build Alternative and the LPA and within a half-mile radius of the proposed station areas. This area was selected based on review of the anticipated limit of disturbance of the proposed improvements and was determined to be of sufficient size to capture the potential land use effects. Land use was assessed at the regional, county, and corridor level. Projections of land use changes included direct conversion of land for transit facilities.

Historic U.S. Census data, including data from Census 2000, were reviewed to obtain population and employment information. The Metropolitan Washington Council of Governments' (MWCOG) forecasts of growth in population, households, and employment documented in Round 6.3 Forecasts (Round 6.3) were used to project growth through year 2025. MWCOG is the Metropolitan Planning Organization (MPO) for the Washington metropolitan region. The Round 6.3 data are provided in regular intervals through year 2025. The Round 6.3 forecasts do not provide data for the opening year of the Wiehle Avenue Extension in 2011, however data for the year 2010 and for the opening year of the full LPA in 2015 is included.

The effects of secondary development within the half-mile station areas associated with the No Build Alternative, the Wiehle Avenue Extension, and the full LPA are described in Chapter 5. Chapter 5 also includes the effects of population and employment changes within the station areas.

3.1.2 EXISTING CONDITIONS AND FUTURE PROJECTIONS

This section describes current land use, population, housing, and employment characteristics within the Dulles Corridor and is divided into regional and corridor-level analyses. The regional-level discussion includes analyses for the Washington, D.C. metropolitan area and for Fairfax and Loudoun counties. The corridor-level analysis focuses on the land use characteristics of the Dulles Corridor.

3.1.2.1 Regional Characteristics

Land use within the Washington metropolitan region follows the same pattern found in many major U.S. metropolitan areas. At the heart of the region is downtown Washington, D.C. Surrounding this urban core is a series of rings of suburban development with decreasing densities, surrounded by a series of outer suburbs that are rural in nature.

While every major classification of land use exists within the region, some characteristics are unique to specific geographic areas. To meet its high employment and space requirements in the vicinity of the nation's capital, the federal government has more land defined as government or publicly owned than most other regions. Although the majority of federally owned land lies within Washington, D.C., government uses have recently expanded into Arlington County, the City of Alexandria, and Fairfax County. Metrorail corridors, such as the Rosslyn-Ballston Corridor in Arlington County, have extensive mixed-use land classifications. These mixed-uses have developed over time as the land around Metrorail stations has been developed according to local comprehensive plans that support increased densities and a mix of uses.

Regional activity centers are located throughout the Washington metropolitan region. Major regional activity centers include the District of Columbia, Bethesda, Chevy Chase, and Silver Spring in Maryland; and Tysons Corner, Springfield, Centreville, and Reston in Virginia. Each of these activity centers contains a mix of retail, office, industrial, commercial, and residential land uses that support major employment and residential bases. Several of these major regional activity centers are located within the Dulles Corridor, including the City of Falls Church, Tysons Corner, Reston, Herndon, Dulles Corner, Dulles International Airport and Eastern Loudoun County.

Development in the region over the last 50 years has occurred along radial transportation corridors, such as I-270, I-95, I-66 and the Dulles Toll Road, and along the Capital Beltway. Activity centers, such as Tysons Corner and Springfield, have developed at major crossroads. As development along these corridors has intensified, suburban development has spread to fill in the areas between these corridors.

MWCOG is responsible for maintaining and updating the regional population and employment model, which is used by the region for planning purposes. MWCOG has defined the region to include Washington, D.C., Montgomery, Prince George's, Arlington, Fairfax, Loudoun, Prince William, Frederick, Charles, Calvert, and Stafford counties; and the cities of Alexandria, Fairfax, Falls Church, Manassas, and Manassas Park. For air quality conformance, this definition of the region and the MWCOG model projections are used throughout this Environmental Impact Statement (see section 4.6).

As shown in Table 3.1-1, the region's population is expected to grow steadily through year 2025, at an average of approximately 58,000 more persons per year. Population growth is expected to be spurred by the long-term strength of the region's economy, high rates of migration into the region from other U.S. and international locations, and less-rapid declines in average household size than were previously anticipated in prior forecasts. The region's population that is 65 years of age and older will more than double between 2000 and 2025, while the number of children will increase by approximately 30 percent during the same period.

Table 3.1-1: Expected Growth in Regional and County Population

	2000	2005	2010	2015	2025	Total Change (2000 - 2025)	Percent Increase
Region							
Population	4,458,797	4,877,851	5,208,832	5,507,071	5,887,286	1,428,489	32%
Persons/Acre	1.60	1.75	1.87	1.98	2.12	0.52	32%
Fairfax County							
Population	987,919	1,065,896	1,136,325	1,172,569	1,210,815	222,896	23%
Persons/Acre	3.72	4.01	4.28	4.42	4.56	.84	23%
Loudoun County							
Population	168,748	238, 409	299,571	350,333	422,190	253,442	150%
Persons/Acre	0.51	0.71	0.90	1.05	1.27	0.76	150%

Source: MWCOG Round 6.3 Forecasts; MWCOG projections for Fairfax County include the cities of Fairfax and Falls Church.

The greatest population growth in the region will be in Loudoun, Fairfax, and Montgomery counties. Outer jurisdictions that will experience the fastest rates of growth and greatest total amounts of growth are led by Loudoun (150 percent), Charles (62 percent), and Frederick (55 percent) counties. The region's central jurisdictions will grow more slowly. In Arlington County and the City of Alexandria, population will increase by 16 and 17 percent, respectively. Washington, D.C. will experience an end to its recent short-term population loss and is expected to grow by 24 percent during the 2000 to 2025 forecast period.

MWCOG predicts an increase of more than 587,000 households in the region during the 2000 to 2025 forecast period, reflecting the growth in jobs and the migration of new residents moving into the region. The largest number of new households will be in Loudoun and Fairfax counties (shown in Table 3.1-2), and Montgomery County, which collectively will contribute nearly 50 percent of the household growth during the forecast period. Loudoun County will grow the most rapidly of all corridor jurisdictions, adding approximately 90,000 households to a year 2000 base of 59,900 households.

Table 3.1-2: Expected Growth in Regional and County Households

	2000	2005	2010	2015	2025	Total Change (2000 - 2025)	Percent Increase
Region	1,710,808	1,868,254	2,005,977	2,132,867	2,298,269	587,461	34%
Fairfax County	363,734	395,433	422,869	436,373	449,885	86,151	24%
Loudoun County	59,900	84,855	106,572	124,553	149,985	90,085	150%

Source: MWCOG Round 6.3 Forecasts; MWCOG projections for Fairfax County include the cities of Fairfax and Falls Church.

Regional employment projections, shown in Table 3.1-3, predict an increase of 41 percent from 2000 to 2025, with employment experiencing a slightly higher rate of growth than both population and households.

Table 3.1-3: Expected Growth in Regional Employment and Employment within Corridor Juridisctions

Area	2000	2005	2010	2015	2025	Total Change (2000 - 2025)	Percent Increase
Region							
Employment	2,826,210	3,079,949	3,376,883	3,584,716	3,994,729	1,168,519	41%
Jobs/Acre	1.02	1.11	1.21	1.29	1.44	0.42	41%
Fairfax County							
Employment	573,027	635,428	694,622	720,163	778,498	205,471	36%
Jobs/Acre	2.16	2.39	2.62	2.71	2.93	0.77	36%
Loudoun County							
Employment	87,044	109,926	137,083	166,214	224,453	137,409	158%
Jobs/Acre	0.26	0.33	0.41	0.50	0.67	0.41	158%

Source: MWCOG Round 6.3 Forecasts: MWCOG projections for Fairfax County include the cities of Fairfax and Falls Church

Fairfax County, Prince George's County, Loudoun County, and Washington, D.C. are projected to add the largest numbers of new jobs to the region's employment base during the 2000 to 2025 forecast period, followed by Montgomery, Arlington, Frederick, and Prince William counties. As with population and household growth, the largest percentage increases in employment will occur in the outer suburbs of Virginia and Maryland. Despite the tremendous growth in suburban employment indicated in the forecasts, Washington, D.C. will continue to have the largest number of jobs of any single jurisdiction and will account for more than one-fifth of the region's employment.

3.1.2.2 Local Characteristics

Land use along the Dulles Corridor is controlled by Fairfax County, the Town of Herndon, and Loudoun County.

A. Fairfax County

Fairfax County encompasses 399 square miles. Over the past 50 years, Fairfax County has changed from a rural and agricultural area to an urbanized metropolitan area. The county, particularly the eastern portion, is now largely developed and includes a mixture of low-density residential, commercial, industrial, and public land uses. About 54 percent of the land in Fairfax County is used for residential purposes. Industrial and commercial land uses each account for almost 4 percent of the total developed acreage. Other major land uses include parklands (12 percent) and public facilities or institutions (11 percent). About 16 percent of the land in Fairfax County is now vacant or undevelopable open space.

With more than 100 million square feet of office space, and more than 500,000 employees, Fairfax County is one of the nation's largest commercial real estate markets (Fairfax County Economic Development Authority, 2003). The majority of this development has taken place along the major transportation corridors in the county: the Dulles Toll Road, I-66, I-495 (Capital Beltway), I-395/I-95, and Route 28.

The highest growth rates in Fairfax County occurred during the 1940s and 1950s. While the rate of growth has slowed since that time, the county is continuing to grow and is home to more than one million residents, making it the most populous jurisdiction in the region. MWCOG projections show the county population increasing by approximately 15 percent between 2000 and 2010, and 24 percent between 2000 and 2025. In 2025, Fairfax County will still be the most populous jurisdiction in the region and will be one of only two in the region with more than one million residents.

Fairfax County has more than 380,000 housing units, of these, approximately 50 percent are single-family homes, 26 percent are multi-family units, and 24 percent are townhouses.

Employment in Fairfax County has increased and will continue to increase rapidly. As shown in Table 3.1-3, employment in Fairfax County is estimated to increase by 36 percent between 2000 and 2025, adding more than 200,000 jobs and outpacing population in the county.

B. Loudoun County

Loudoun County encompasses 517 square miles and is much more rural than Fairfax County. More than 60 percent of the total land area in the county is used for agricultural purposes, and 24 percent is in residential use. Industrial and commercial uses account for 6 percent of the total acreage, with public and open space uses accounting for the remaining 9 percent.

Like Fairfax County, commercial development is focused along the county's major transportation corridors: Route 7, Route 28, and the Dulles Greenway. The county contains 12.6 million square feet of office space and 14 million square feet of industrial and flex space for more than 100,000 employees. Almost all commercial development in the county is focused in the eastern portion of the county, leaving the remainder of the county largely agricultural, with a few small towns located at major crossroads.

The rapid growth in Loudoun County is part of a second wave of suburban expansion. From 1900 to 1960, the population of the county remained relatively stable. However, starting in the 1960s, the county began three decades of approximately 50 percent growth per decade. According to the most recent U.S. Census, the county increased in population by more than 95 percent in the past decade.

Loudoun County population is expected to increase 78 percent between 2000 and 2010, and by 150 percent between 2000 and 2025. The vast majority of new development is planned for the eastern third of the county, resulting in significantly higher densities in that area.

Although Fairfax County has far more residential units than Loudoun County, Loudoun County's housing stock is growing at a faster rate. Loudoun County has approximately 73,000 units, representing an increase of 17.4 percent over 2000. Of these, 54 percent are single-family, 26 percent are townhouses, and 20 percent are multi-family.

As shown in Table 3.1-3, employment in Loudoun County is estimated to increase by more than 158 percent by 2025, four times as fast as Fairfax County. This reflects the job growth occurring in the existing and emerging activity centers in the county.

3.1.2.3 Land Use Controls and Comprehensive Planning

Current comprehensive plans and zoning ordinances for the study area were reviewed to determine their land use objectives and transportation policies in relation to the project. The proposed land use as defined in these comprehensive plans for the entire Dulles Corridor area is shown in Figure 3.1-1, and reflects the mix uses that are currently permitted in the corridor.

The study area for determining potential long-term land use effects of the alternatives was defined as land within 300 feet of either side of the centerline of the No Build Alternative and the full LPA and within a half-mile radius of the proposed station areas. Fairfax County, the Town of Herndon, and Loudoun County regulate land use within these areas through comprehensive planning and zoning ordinances. A brief summary of the comprehensive plans of these three jurisdictions follows.

A. Fairfax County Comprehensive Plan

The *Fairfax County Comprehensive Plan* has three components: the Policy Plan, Area Plan, and the Comprehensive Plan Map. The Policy Plan explains the county's goals, objectives, and policies regarding land use, transportation, housing, environment, and other planning areas. The Area Plans are site-specific, and are divided into Planning Districts, Community Planning Sectors, and special areas, such as the Tysons Corner Urban Center and several Suburban Centers. The third component, the Comprehensive Plan Map, is a generalized depiction of the pattern of future land use, transportation, public facilities, and other planned features.

The Area Plans implement the Policy Plan's goals and objectives at the more detailed Planning District and Community Planning Sector levels. The Area Plans contain detailed recommendations for a wide range of planning areas. The Dulles Corridor includes the McLean, Vienna, and Upper Potomac planning districts, the Tysons Corner Urban Center, the Reston-Herndon Suburban Center, and the Dulles Suburban Center. Based on the work of the Dulles Corridor Land Use Task Force, appointed by the Fairfax County Board of Supervisors to review the *Fairfax County Comprehensive Plan* as part of the County’s commitment to transit supportive policies in the corridor, revisions to the Comprehensive Plans for Reston, the Herndon area outside of the Town of Herndon, and the Dulles Corner area have been adopted by Fairfax County, and have been incorporated into this analysis.

In addition, the Dulles Corridor Land Use Task Force recommended that covenants that are in effect in Reston be lifted. These covenants restrict residential development within close proximity to the Dulles Toll Road and would have to be lifted in order for Fairfax County to implement mixed-use development at the Transit Station Areas in Reston.

B. Town of Herndon Comprehensive Plan

The *Town of Herndon's Comprehensive Plan*, adopted June 1990, sets goals for land use, parks and recreation, public facilities, transportation, and heritage preservation. The Transportation Element of the plan was updated in 1997 and reflects rapid transit in the Dulles Corridor. All land within the town is assigned to one of four land use categories: neighborhood conservation, services and industry, community facilities, and adaptive areas. Each of these categories has general land use goals established for large areas of the town, with specific uses and densities specified in the zoning regulations.

This Page Intentionally Left Blank

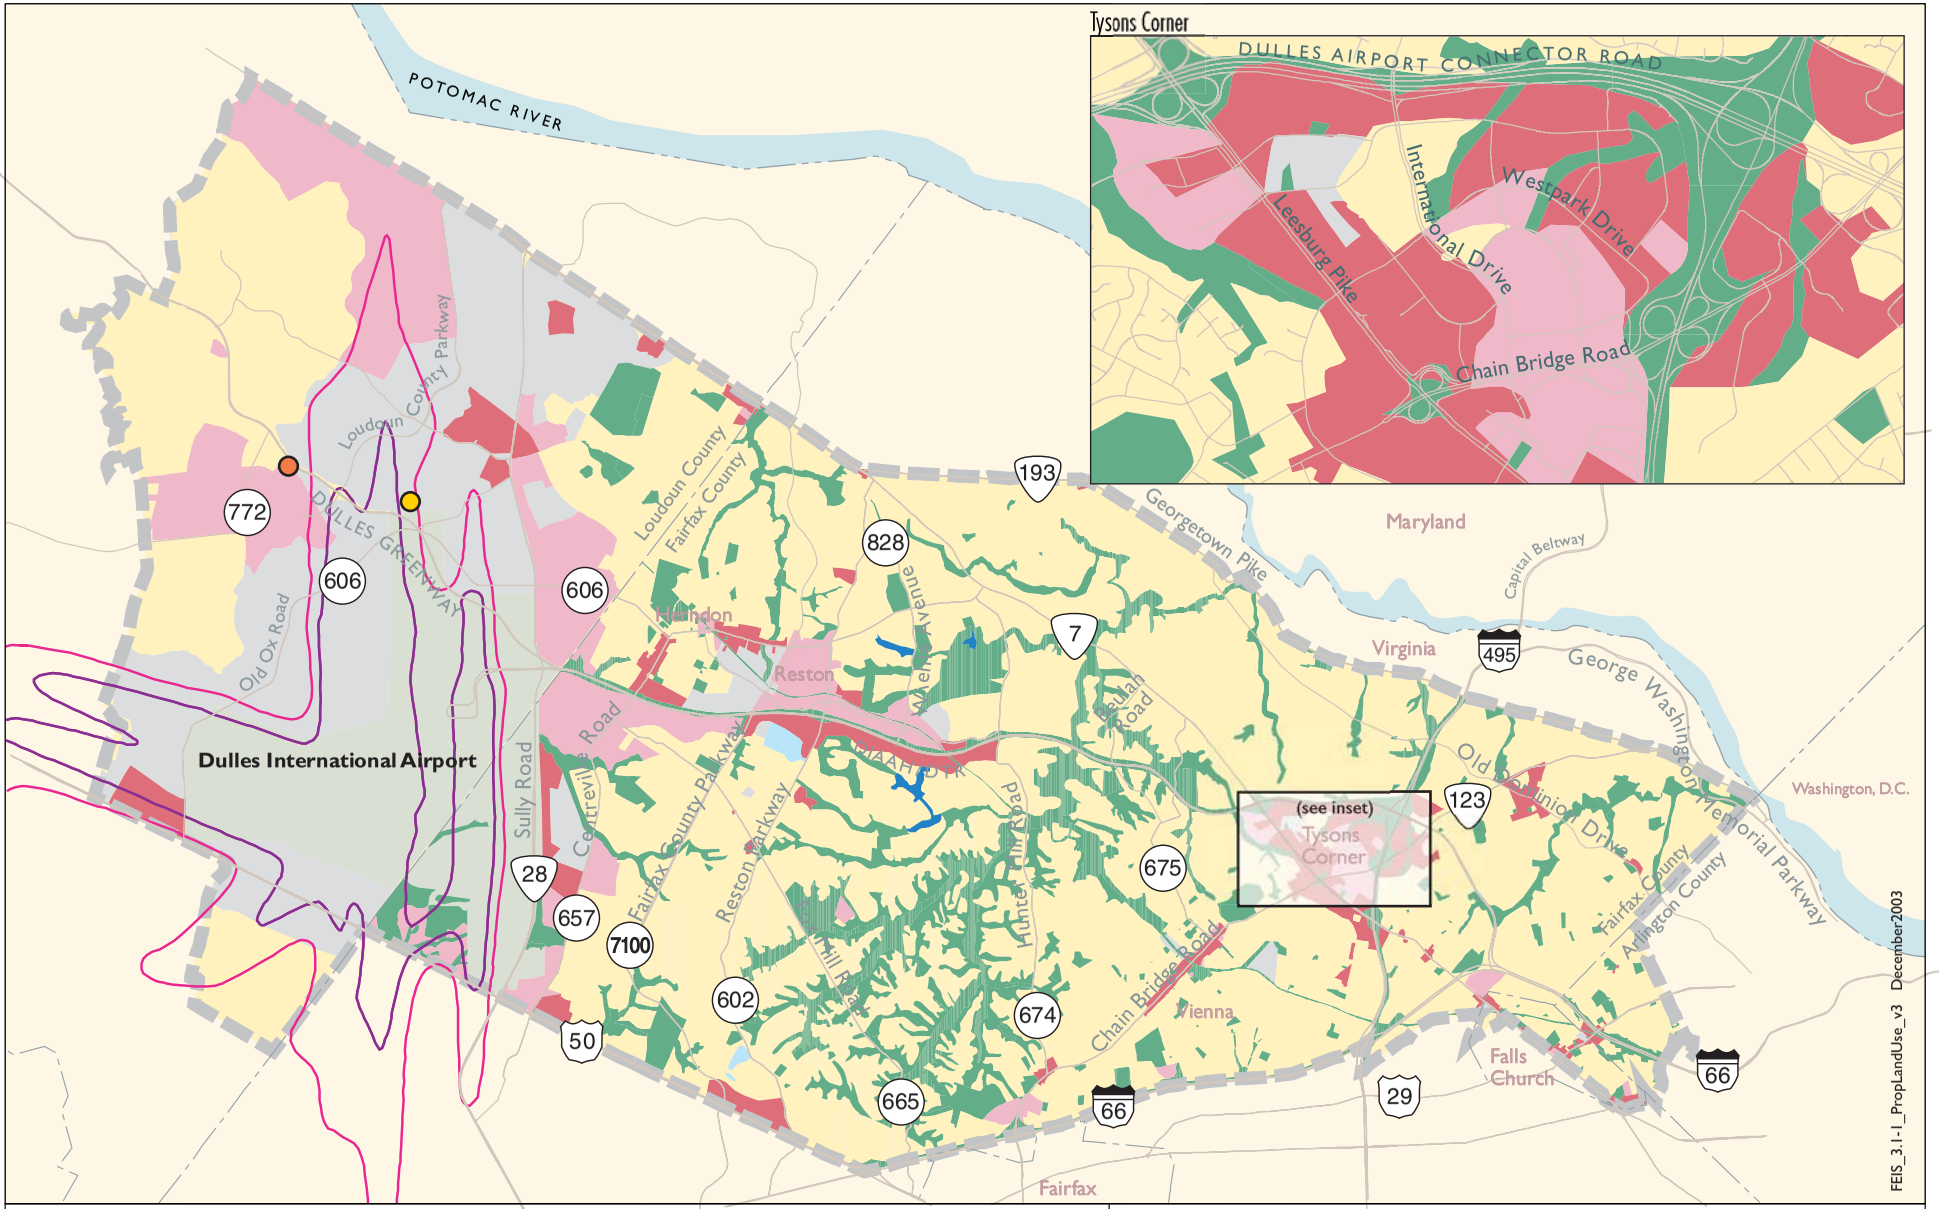

Figure 3.1-1

Proposed Land Use in the Dulles Corridor

Dulles Corridor Rapid Transit Project

C. Loudoun County Revised Comprehensive Plan

On July 23, 2001, the Loudoun County Board of Supervisors approved a *Revised Comprehensive Plan*, which will guide development in the county for the next 20 years. Adoption of the *Revised Comprehensive Plan*, which includes the *General Plan* and the *Countywide Transportation Plan*, came after a year-and-a-half of extensive study and public input, including community meetings, public hearings, and public comment.

The *Revised Comprehensive Plan* includes several refinements that promote the development of efficient and convenient local commuter transit services, including rail in the Dulles Greenway Corridor. The plan refines recommended uses within the corridor, including more detail on transit nodes located in the vicinity of the proposed stations at Route 606 and Route 772. As part of the implementation of the *Revised Comprehensive Plan*, the Loudoun County Board of Supervisors adopted changes to the county's zoning ordinance and developed a new zoning map. The revisions include changes to land use in the proposed station areas that would allow for transit-oriented development with increased densities, mixed-uses, pedestrian amenities, and reductions in automobile parking requirements.

D. Loudoun County Toll Road Plan

During the development of the General Plan, the Loudoun County Planning Commission and Board of Supervisors identified the need to formulate more specific land use policies for land adjacent to the Dulles Greenway. In 1995, the county issued the *Toll Road Plan*, with the goal of maximizing the economic benefit from development within the corridor. The *Toll Road Plan*, although separate from the General Plan, is part of the County's comprehensive plan. In Loudoun County, the Dulles Corridor falls within the Toll Road Plan's area.

The land use strategy for the Dulles Toll Road area is designed to promote compact development at interchange and transit facilities. The highest intensity development in the planning area would occur at nodes, which are planned around the Route 606 and Route 772 interchanges with the Dulles Greenway. Nodes are intended to be areas of dense, compact development centered on a transit station with densities tapering from the core. The *Toll Road Plan* states that nodes will be mixed-use in character in all locations, except for those located within Business Employment areas, which will not have a residential component.

3.1.2.4 Corridor Characteristics

The Dulles Corridor is expected to experience substantial growth (nearly 50 percent) in population and employment (nearly 70 percent) over the next 25 years. However, land use patterns throughout the corridor are expected to remain largely as they are today, with most new growth occurring at existing and emerging activity centers including the City of Falls Church, Tysons Corner, Reston/Herndon, Dulles Corner, Dulles International Airport and Easter Loudoun County.

A. Existing and Future Land Uses

This section discusses existing and future land uses within the project corridor. Details regarding neighborhoods, community services, cultural resources and parks are located in Sections 3.2, 3.5 and 3.6 of this chapter. Future growth in commercial or mixed-use development is expected to occur in Tysons Corner, Reston, Herndon (near the Route 28 interchange), and in Loudoun County near the intersection of Route 772 and the Dulles Greenway.

Land use in the area surrounding the Dulles Connector Road between West Falls Church and Tysons Corner is almost entirely residential in nature. According to the *Fairfax County Comprehensive Plan,*

development in the area surrounding the Dulles Connector Road will continue to be residential in the future. Infill and redevelopment is expected to generate small increases in population and employment in this section.

East of the Capital Beltway, the Tysons Corner area consists primarily of offices with areas of residential development located on the fringe. The *Fairfax County Comprehensive Plan* calls for this area of Tysons Corner to maintain roughly the same proportion of land uses, but at a more intense level. Commercial uses in this area are to continue their development as office parks. The vacant parcels would infill with additional office use; low-rise buildings would redevelop to mid-rise and high-rise office buildings with supporting retail and service uses. In the residential areas, the plan calls for continued residential use at the existing scale with redevelopment of existing low-rise garden apartments to mid-rise, multi-family dwelling use to encourage more housing adjacent to employment locations.

West of the Capital Beltway, Tysons Corner is divided into several areas of development with various types of land use. The West*Park area is located north of Westpark Drive and east of International Drive and includes more than five million square feet of office space in more than 25 buildings. Residential land use in the West*Park area includes the Lincoln Apartments complex adjacent to International Drive. The West*Park area is planned to continue as an office park, with supporting retail and services, and the option of residential uses.

Immediately south of West*Park is the Tysons II area, bounded by Westpark Drive, International Drive, and Route 123. It includes the Galleria at Tysons II shopping mall (with more than one million square feet of retail space) and a significant amount of office, hotel, and residential land uses. Adjacent to the mall are several large office towers and a hotel. To the north of the shopping mall are two residential developments. In 2003, Fairfax County approved up to 6.8 million square feet of mixed-use development for the area between the Galleria shopping mall and Route 123. The development would consist of nine high-rise towers, four of which would stand 30 stories. It would also include pedestrian bridges, small plazas, wide sidewalks, structured parking, and a park with an amphitheater.

The Tysons I area is bounded by Route 123, Route 7, and the Capital Beltway. This area contains the largest shopping mall in the region (eighth largest in the country), the Tysons Corner Center, as well as several office buildings and smaller retail land uses. The Tysons Corner Center area is to continue its regional shopping focus, but could add convention or recreation uses. West of International Drive, the area surrounding the Route 7 and Route 123 interchange is envisioned to gradually redevelop from the existing strip retail development to mid-rise and high-rise office buildings that would include support retail and service uses.

International Drive, Westpark Drive, Route 123, and Route 7 bound the Greensboro Drive area, which features much of the prominent office development in Tysons Corner. The most prominent feature in the area north of Greensboro Drive is the Rotonda Condominium Complex, which has more than 1,100 units. In contrast to the large shopping malls to the east, retail land use within this portion of Tysons Corner is focused along Route 7 and consists primarily of car dealerships and an assortment of service and convenience retail outlets. Adjacent to the Dulles International Airport Access Highway (DIAAH) and Dulles Toll Road, the Tyco Road area includes the majority of the industrial uses in the Tysons Corner study area, including several automobile repair shops, two storage facilities, and a flex industrial building.

In the future, the Greensboro Drive area would continue to be the office core of Tysons Corner. Because no undeveloped land is available, infill and redevelopment opportunities would be encouraged. Some

surface parking lots could be redeveloped into office space with structured parking. In addition, the *Fairfax County Comprehensive Plan* encourages the development of pedestrian-oriented plazas and courtyards in the Tysons Corner area. The high-density residential uses to the north and east of Greensboro Drive are anticipated to remain, while the industrial area to the north of Spring Hill Road could either remain industrial or be redeveloped for mixed-use. The retail uses along Route 7 are planned for redevelopment with mid-rise and high-rise office buildings that include retail and support services.

West of Route 7, the study area includes a mixture of office parks, strip retail, hotels, and other uses. Major commercial development is centered on Spring Hill Road and Westwood Center Drive, generally in multi-building office parks near the DIAAH and Dulles Toll Road. West of the retail land use on Route 7 are a number of residential uses, including townhouse communities, providing a buffer for the single-family neighborhoods farther west. Within the section of the corridor generally bounded by the Route 7 interchange with the DIAAH and the Dulles Toll Road, no changes in land use are projected by 2025 for the majority of residential areas.

Tysons Corner has transformed from a rural crossroads with a general store in the 1950s to the urban center of Fairfax County today. Tysons Corner has roughly 26,000 residents and 87,000 employees. Although Tysons Corner contains less than 2 percent of the county's population, it has approximately 15 percent of the county's jobs. By 2025, population in Tysons Corner will increase by 36 percent and employment will increase by 42 percent.

Land use in the section of the corridor that extends from Tysons Corner to Route 28 varies from purely residential neighborhoods in the east to suburban office parks in the west. West of Tysons Corner and east of Reston are single-family detached homes on half-acre to 1-acre lots. West of Hunter Mill Road, the section includes parts of Reston, Herndon, and Dulles Corner, an area comprised of suburban office parks adjacent to the DIAAH and the Dulles Toll Road, with residential areas, primarily single-family neighborhoods, at the periphery.

Within the area generally bounded by the Route 7, the Dulles Toll Road and Hunter Mill Road, the dominant land use is single-family residential, with some small institutional uses such as churches, as well as the Wolf Trap Center for the Performing Arts. Reston, a planned community located on either side of the DIAAH and Dulles Toll Road, extends from the Hunter Mill Road interchange on the east to the Fairfax County Parkway on the west. Residential areas are located north of Sunset Hills Road and south of Sunrise Valley Drive, with an approximately equal number of residents on either side.

Residential development was prohibited from parcels immediately adjacent to the Dulles Toll Road between Sunset Hills Road and Sunrise Valley Drive until recent changes in the *Fairfax County Comprehensive Plan*. However, it is still prohibited by existing land covenants. In general, land between Sunrise Valley Drive and Sunset Hills Road has been developed with retail and commercial office space. North of Sunset Hills Road, the Reston Town Center features more than 900,000 square feet of office space in three towers and one low-rise building, and approximately 270,000 square feet of retail space. Several medium- to high-density residential uses are currently being developed in the area just west of the Town Center. More retail space is located west of the Reston Town Center on Sunset Hills Road. South of the DIAAH and the Dulles Toll Road, there is a cluster of small retail outlets adjacent to the Reston International Center. A number of undeveloped parcels in Reston are located near Wiehle Avenue. Two are located on Michael Faraday Court, another is adjacent to Isaac Newton Square, and several small parcels used as a power easement are adjacent to the W&OD Railroad Regional Park.

The Town of Herndon, and portions of Fairfax County known as Dulles Corner, lie west of Reston. Office development exists north of Sunrise Valley Drive and along both sides of Herndon Parkway in Herndon and in the Dulles Corner area. Office use in this area also includes the Dulles Technology Center and Dulles Corner Park on Fox Mill and Horse Pen Roads. The Dulles Technology Center contains low- and mid-rise office/flex development. The Dulles Corner Park is located between Horse Pen Road and the Dulles Toll Road/Route 28 interchange.

The Herndon-Monroe Park-and-Ride lot, owned and operated by Fairfax County, is located south of the DIAAH and Dulles Toll Road. The facility has 1,745 parking spaces and provides connections to a number of local and express buses. Residential land use in the Herndon/Dulles Corner area consists of single-family homes with some townhouses, condominium units, and apartments.

As part of recent revisions to the *Fairfax County Comprehensive Plan*, the county has defined some portions of the corridor as Transit Station Areas. Within these Transit Station Areas, located at Wiehle Avenue, Reston Parkway, Herndon-Monroe, and Route 28, proposed changes in land use mix are now incorporated into the latest revisions in the Comprehensive Plan. The changes in land use mix are now permitted without the construction of Metrorail, but at lower densities, and could result in a change of land uses from office to mixed-use, allowing for residential development to occur in the study area by 2025. As stated previously, covenants must be lifted in order for residential development to occur in close proximity to the DIAAH/Dulles Toll Road in Reston. Additional density bonuses are permitted if Metrorail is implemented.

Despite language in the *Fairfax County Comprehensive Plan* allowing residential development in this area, the Reston Center for Industry and Government Declaration of Protective Covenants and Restrictions prohibits residential development of any kind in areas that have been zoned for industrial or commercial uses.

Land in the Reston/Herndon area is projected to continue to develop into office, residential, and mixed-use classifications as undeveloped parcels are developed. However, the recent changes to the *Fairfax County Comprehensive Plan*, covenant issue not withstanding, are likely to encourage the introduction of residential uses along the DIAAH and Dulles Toll Road, and the intensification of residential and commercial development by 2025. Most growth in this portion of the corridor is anticipated to occur in the Reston, Herndon, and the Center for Innovative Technology/Dulles Station areas. Reston is projected to add more than 15,000 residents and nearly 20,000 employees, while the Herndon/Dulles Corner area is expected to add nearly 20,000 residents and 22,000 employees.

Dulles Airport, as shown in Figure 1.1-1, encompasses 11,000 acres of land within both Fairfax and Loudoun counties west of Route 28. The terminal buildings have more than 50 shops and restaurants. No residential facilities are present on airport property, but hotel and office buildings are present.

The Metropolitan Washington Airports Authority (MWAA) recently completed a new master plan for improvements to Washington Dulles International Airport (Dulles Airport). The plan calls for $3.4 billion in improvements, including the construction of a new circulator people mover system, two new parking garages, an additional concourse, and an additional runway, all of which are to be completed by 2007. This expansion is needed to accommodate projected increases in passengers and employment at the airport. As part of their planning efforts, MWAA projects that employment will grow to 30,000 by 2010 and as much as 65,000 by 2035. In comparison, the MWCOG projections in Table 3.1-3 are much lower.

The segment of the project corridor located in Loudoun County is bounded by Route 7 to the north, Fairfax County to the east and Route 659 and Goose Creek to the west, exclusive of Dulles Airport property. This portion of the corridor has industrial, residential, and undeveloped land. The eastern portion of this section, nearest Dulles Airport, is largely industrial in nature and dominated by several large warehouse facilities. The western portion of the study area, where developed, is residential, ranging from multi-family complexes to large-lot, single-family homes.

The *Loudoun County Revised Comprehensive Plan* calls for the development of "keynote employment" and industrial land uses in the eastern portion of the Dulles Greenway north of the airport. In general, the area south of the Dulles Greenway and outside the airport property is planned for industrial use. North of Dulles Greenway plans call for large-scale regional office development and the creation of a high-density node immediately north of the airport property. Due to its proximity to the airport, county regulations prohibit residential development in this node.

Along the Dulles Greenway near Route 772, the planned land use is a high-density, mixed-use node for office, residential, and retail development. The area north of the Dulles Greenway is planned for a regional office node that could include 15 to 25 percent residential land uses. South of the Dulles Greenway, the *Revised Comprehensive Plan* calls for development of a mixed-use node. Land north of the station is designated for high-density residential development. On January 6, 2003, the Loudoun County Board of Supervisors adopted revisions to the county's zoning ordinance and a new zoning map that included changes within the Route 772 Station area. The permitted zoning in the area will now allow for the development of a mix of compatible, compact, high-density, transit-oriented uses. This area is expected to receive much of Loudoun County's growth over the next 25 years.

3.1.3 LONG-TERM EFFECTS

This section discusses the long-term (2025) effects to land use that would result from the No Build Alternative, the Wiehle Avenue Extension, and the full LPA. Table 3.1-4 presents a summary of these effects. These effects are defined as the compatibility of the No Build Alternative, the Wiehle Avenue Extension, and the full LPA with existing land uses in the corridor, zoning of the parcels in which the project facilities would be located, planned development, and locally adopted comprehensive plans. Secondary development effects, such as increased densities, population and employment changes are discussed in Chapters 5 and 9.

The land use plans adopted by local governments within the Dulles Corridor all contain guidelines to support higher densities, mixed-use development, and walkable, bicycle-friendly development in close proximity to transit stations.

Table 3.1-4: Land Use Compatibility

Land Use Elements	No Build Alternative (2025)	Locally Preferred Alternative		
		Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Compatible with Existing Land Use	Yes	Yes	Yes	Yes
Compatible with Zoning	Yes	Yes, although special exceptions would be required at some station areas.	Yes, although special exceptions would be required at some station areas.	Yes, although special exceptions would be required at some station areas.
Compatible with Planned Developments	No	Partially	Partially	Yes
Consistent with Comprehensive Plans	No. All plans assume high-capacity transit improvements in the Dulles Corridor.	Partially. Plans assume the high-capacity transit improvements included in the full LPA.	Partially. Plans assume high-capacity transit improvements for the full LPA.	Yes

3.1.3.1 No Build Alternative

Under the No Build Alternative land use would continue to be directed by existing comprehensive planning guidelines with no transit-based density bonuses. Local land use and transportation plans reflect any improvements included in the No Build Alternative. Therefore, the No Build Alternative is consistent with existing land use and zoning in the corridor.

However, the No Build Alternative is not compatible with planned developments, many of which have been designed to accommodate higher density in build-out years that would be allowed should high-capacity transit be implemented in the corridor. The No Build Alternative is also inconsistent with locally adopted comprehensive plans. The comprehensive plans for all localities include the provision of transit within the Dulles Corridor as a critical element of their transportation systems by 2025.

3.1.3.2 Wiehle Avenue Extension

The Wiehle Avenue Extension would be consistent with planned developments in Tysons Corner that have anticipated the presence of high-capacity transit in the corridor, however, it would be inconsistent with planned developments near Reston Parkway, Herndon-Monroe, Route 28/Dulles Corner, and Route 772 in Loudoun County that were designed in anticipation of high-capacity transit improvements. Similarly, the Wiehle Avenue Extension would be partially consistent with the *Fairfax County Comprehensive Plan*, but it would not provide the high-capacity transit improvements envisioned in the Loudoun County portion of the corridor.

Because Wiehle Avenue Extension would be constructed primarily within existing transportation rights-of-way, direct land use conversions and conflicts with surrounding land uses would be minimal. The extension of Metrorail within existing transportation corridors would be consistent with existing and future land uses. The Wiehle Avenue Extension would be consistent with existing zoning along the proposed alignment, except in some cases where special exceptions would be required for the construction of station facilities. Station facilities typically consist of entrance pavilions, parking facilities, bus bays, Kiss & Ride areas, park-and-ride lots, and new access roads. Ancillary facilities would also be located at several areas along the corridor and convert small areas of land with minimal effect. Ancillary facilities include traction power substations, stormwater management ponds, and tie-breaker stations.

Direct land use conversions that would result from the Wiehle Avenue Extension are described starting from the Orange Line connection and extending west.

Beginning from the east, the Wiehle Avenue Extension would add a new lead track to connect with the existing rail yard at West Falls Church. New facilities, including more rail car storage spaces, would be added within the existing rail yard area.

Existing residential land would be converted for ancillary facilities for a tie-breaker station, located on the south side of the Dulles Connector Road and an access road from Plainfield Street. Further west, residential land along the property line between two residences on the cul-de-sac at the south end of Baldwin Drive would be converted for use as an access road to a new substation located within the right-of-way of the Dulles Connector Road. In addition, a traction power substation would be added within the Dulles Connector Road right-of-way via an access road provided off of Olney Road.

After turning off the Dulles Connector Road Corridor, the alignment would require right-of-way that would convert some commercial land along the north edge of Route 123, but would not displace any businesses or impact any structures. At the Tysons East Station, undeveloped land has been proffered for station facilities. The station platform, mezzanine, and bus bays would be constructed on the north side of Route 123, while a stormwater management pond, a Kiss & Ride facility and bus bays would be constructed on the south side of Route 123. Construction of these facilities would not cause the removal of any existing or planned structures, nor would it preclude permitted uses on the remaining portion of the site.

At the Tysons Central 123 Station, land currently zoned for commercial use would be converted for station facilities. On the north side of Route 123, undeveloped land would be converted for the station mezzanine, platform, an entrance pavilion, and bus bays. A portion of the land required for these facilities has been proffered to Fairfax County. South of Route 123 undeveloped land would be converted for more bus bays and another entrance pavilion that would connect to the station platform via a pedestrian bridge across Route 123.

The alignment would go below ground immediately west of the Tysons 123 Station. The next station, Tysons Central 7, would be underground with entrance pavilions on both sides of Route 7. The south entrance pavilion would be located in the current parking lot for the Tysons Square Center shopping center and would require the conversion of approximately 35 parking spaces. The entrance pavilion located north of Route 7 would displace one business and an auto repair shop. In addition, ventilation and emergency equipment shafts would be added to the sidewalks along the side of Route 7 above the station.

The alignment would continue underground for about 1,600 feet until emerging above ground and proceeding along the west side of Route 7 converting some existing access roads and the edges of some parking areas for the facility. At the Tysons West Station, a portion of the parking area for an existing auto dealership located on the south side of Route 7 would be converted for station facilities.

On the north side of Route 7, an existing auto collision center and car rental office zoned for commercial use would be converted to station facilities, including a Kiss & Ride facility bus bays. Special exceptions to the existing zoning may be required for the construction of station facilities.

The alignment would continue along Route 7 before turning westward onto the DIAAH. A substation would be located on commercial property located adjacent to the DIAAH and a stormwater management

pond would be constructed on undeveloped land zoned for commercial use located between the DIAAH and Sunset Hills Road.

Recently adopted comprehensive plan amendments allow for mixed-use development in conjunction with the implementation of high-capacity transit at the Wiehle Avenue Station area. Changes to the land use at the Wiehle Avenue Station area would be dependent upon the progress of joint development being pursued for the site. Under the current plans (without joint development), station facilities would replace an existing park-and-ride lot and a portion of a storage business located north of the DIAAH/Dulles Toll Road. On the south side of the DIAAH/Dulles Toll Road, the landscaped buffer that is currently part of an office development on Sunrise Valley Drive would be converted to bus and sidewalk facilities that would connect to a pedestrian bridge leading to the station mezzanine, which would be located in the center of the DIAAH/Dulles Toll Road.

A tie-breaker station would be located just west of the station between a parking lot and the DIAAH/Dulles Toll Road. Express bus service west of the Wiehle Avenue Extension would include conversion of undeveloped land at the Route 772 station area, located in Loudoun County, to accommodate a transit center with approximately 300 parking spaces.

3.1.3.3 Full LPA

The full LPA is consistent with the *Fairfax County Comprehensive Plan* and the *Loudoun County Revised Comprehensive Plan*, which discuss the potential for Metrorail service in the corridor. The full LPA is also consistent with existing and future land uses in the corridor. A mix of existing land uses along the corridor and several major activity centers could support transit, particularly in Fairfax County. By year 2025, the land use mix would remain generally the same, although intensities would increase and new land uses would be created as Loudoun County develops and converts currently undeveloped land to industrial, office, and residential uses.

Because the full LPA would be constructed primarily within existing transportation rights-of-way, direct land use conversions and conflicts with surrounding land uses would be minimal. The extension of Metrorail within existing transportation corridors would be consistent with existing and future land uses. The full LPA would be consistent with existing zoning along the proposed alignment, except in some cases where special exceptions would be required for the construction of station facilities. Station facilities typically consist of entrance pavilions, parking facilities, bus bays, Kiss & Ride areas, park-and-ride areas, and new access roads. Ancillary facilities would also be located at several areas along the corridor and convert small areas of land with minimal effect. Ancillary facilities include traction power substations, stormwater management ponds, and tie-breaker stations.

Direct land use conversions that would result from the full LPA would be similar to those described for Wiehle Avenue Extension in areas east of the Wiehle Avenue station area.

The Reston Parkway Station facilities would be located partially on land that has been proffered for transit facilities. The facilities on the north side of the Dulles Toll Road would displace some parking spaces in the existing TRW parking lot, which were not proffered for transit facilities. The facilities would include the north entrance pavilion, bus bays, and a Kiss & Ride area. On the south side, approximately 70 parking spaces at the Nextel building on Edmund Halley Drive would be displaced and about 1.25 acres currently used for drainage would be used for station facilities. Land for station facilities (1.5 acres) has been proffered at this location. The facility would include bus bays, a Kiss & Ride area, and station entrance

pavilions. A traction power substation would be located west of the station between the Dulles Toll Road and Sunset Hills Road, near the intersection with Town Center Parkway.

Facilities at the Herndon-Monroe Station would require land north of the DIAAH and Dulles Toll Road. Approximately 10 parking spaces in the President's Plaza office development would be displaced by the station entrance pavilion. South of the DIAAH and Dulles Toll Road, touchdown facilities would be incorporated into the existing Herndon-Monroe park-and-ride garage.

Most of the area that would be used for the Route 28 Station facilities has been proffered for transit facility uses. On the north side, the land required for the station touchdown, bus bays, and a Kiss & Ride area is currently undeveloped. South of the DIAAH and Dulles Toll Road, undeveloped land, planned for mixed-use development, would be converted to bus bays and a parking structure with approximately 2000 parking spaces. These proposed station facilities are consistent the approved development plan for the area.

The Dulles Airport Station would be located underground, as would the alignment near the station. The construction of a Storage & Inspection Yard (S&I) on Site 15 (see Figure 2.3-1) and a stormwater management pond would involve the conversion of land owned the Federal Aviation Administration (FAA) and operated by MWAA from part of a designated buffer zone around the airport to another land use designation. In 2001, the *Airport Land Use Plan* was amended to include a category of "Regional Facilities," which could include major transportation facilities.

The Loudoun County section of the full LPA would place Metrorail tracks in the median of the Dulles Greenway and would include two stations in the vicinity of Route 606 and Route 772.

The Route 606 Station facilities would convert undeveloped land for station facilities. North of the Dulles Greenway, these facilities would include bus bays, a stormwater detention area, a Kiss & Ride facility, and a park-and-ride with approximately 2,000 spaces, in addition to the existing 750 parking spaces. The station of the adjacent Dulles North Transit Center platform and mezzanine would be constructed in the median of the Dulles Greenway.

The Route 772 station would convert undeveloped land for station facilities. On the north side of the Dulles Greenway, facilities would be constructed on currently undeveloped land and would include bus bays, a Kiss & Ride area, and a park-and-ride structure with approximately 1,650 parking spaces. On the south side of the Dulles Greenway, facilities would be constructed on currently undeveloped land and would include bus bays, a Kiss & Ride area, and a park-and-ride structure with approximately 1,650 parking spaces. The station platform, mezzanine, and a tie-breaker station would be located in the median of the Dulles Greenway.

Southwest of the intersection of the Dulles Greenway and Route 772, currently undeveloped land would be converted for use as a possible stormwater management detention pond.

3.1.4 CONSTRUCTION EFFECTS

The following sections detail the short-term construction effects to land use that would result from the alternatives under consideration.

3.1.4.1 No Build Alternative

The No Build Alternative is not anticipated to result in construction-related impacts to population, housing and employment. However, some effects to population, housing, or employment could occur as a result of some of the projects assumed under this alternative. Identification of these effects would be the responsibility of the agencies and jurisdictions implementing the improvements.

3.1.4.2 Wiehle Avenue Extension

Several construction staging areas would be required for the project in Tysons Corner; potential staging areas are shown in Figure 2.3-3. These would result in temporary uses of land along the corridor, although the effects would be minimal. Details regarding the parcels that would be temporarily acquired for these areas are described in Section 3.3.

Construction associated with the Wiehle Avenue Extension would not result in impacts to levels of population or create a need for housing. Construction would generate short-term employment opportunities. The number of person-years of jobs that could be created by construction of the Wiehle Avenue Extension is described in Chapter 5 of this Final EIS.

3.1.4.3 Full LPA

There could be temporary uses of land along the corridor associated with construction staging areas of the stations, but this effect would be minimal. Temporary uses of land could also be required for the construction of the LPA through Tysons Corner and Dulles Airport.

Construction associated with the full LPA would not result in population growth or create a need for housing. Construction would generate short-term employment opportunities. The number of person-years of jobs that could be created by construction of the full LPA is described in Chapter 5 of this Final EIS.

3.1.5 MITIGATION

To mitigate the long-term effects of the Wiehle Avenue Extension and the full LPA on changes in land use associated with the project, DRPT and WMATA would continue to coordinate with Fairfax County, Loudoun County and the Town of Herndon to encourage appropriate transit-oriented development in the station areas. DRPT and WMATA would also work with Fairfax County to ensure that the park-and-ride requirements at the Tysons West station (500 spaces) are incorporated into Fairfax County's Comprehensive Plan, and would also assist Fairfax County in pursuing joint-development opportunities at the Wiehle Avenue station.

3.2 NEIGHBORHOOD, COMMUNITY SERVICES, AND COMMUNITY COHESION IMPACTS

3.2.1 METHODOLOGY

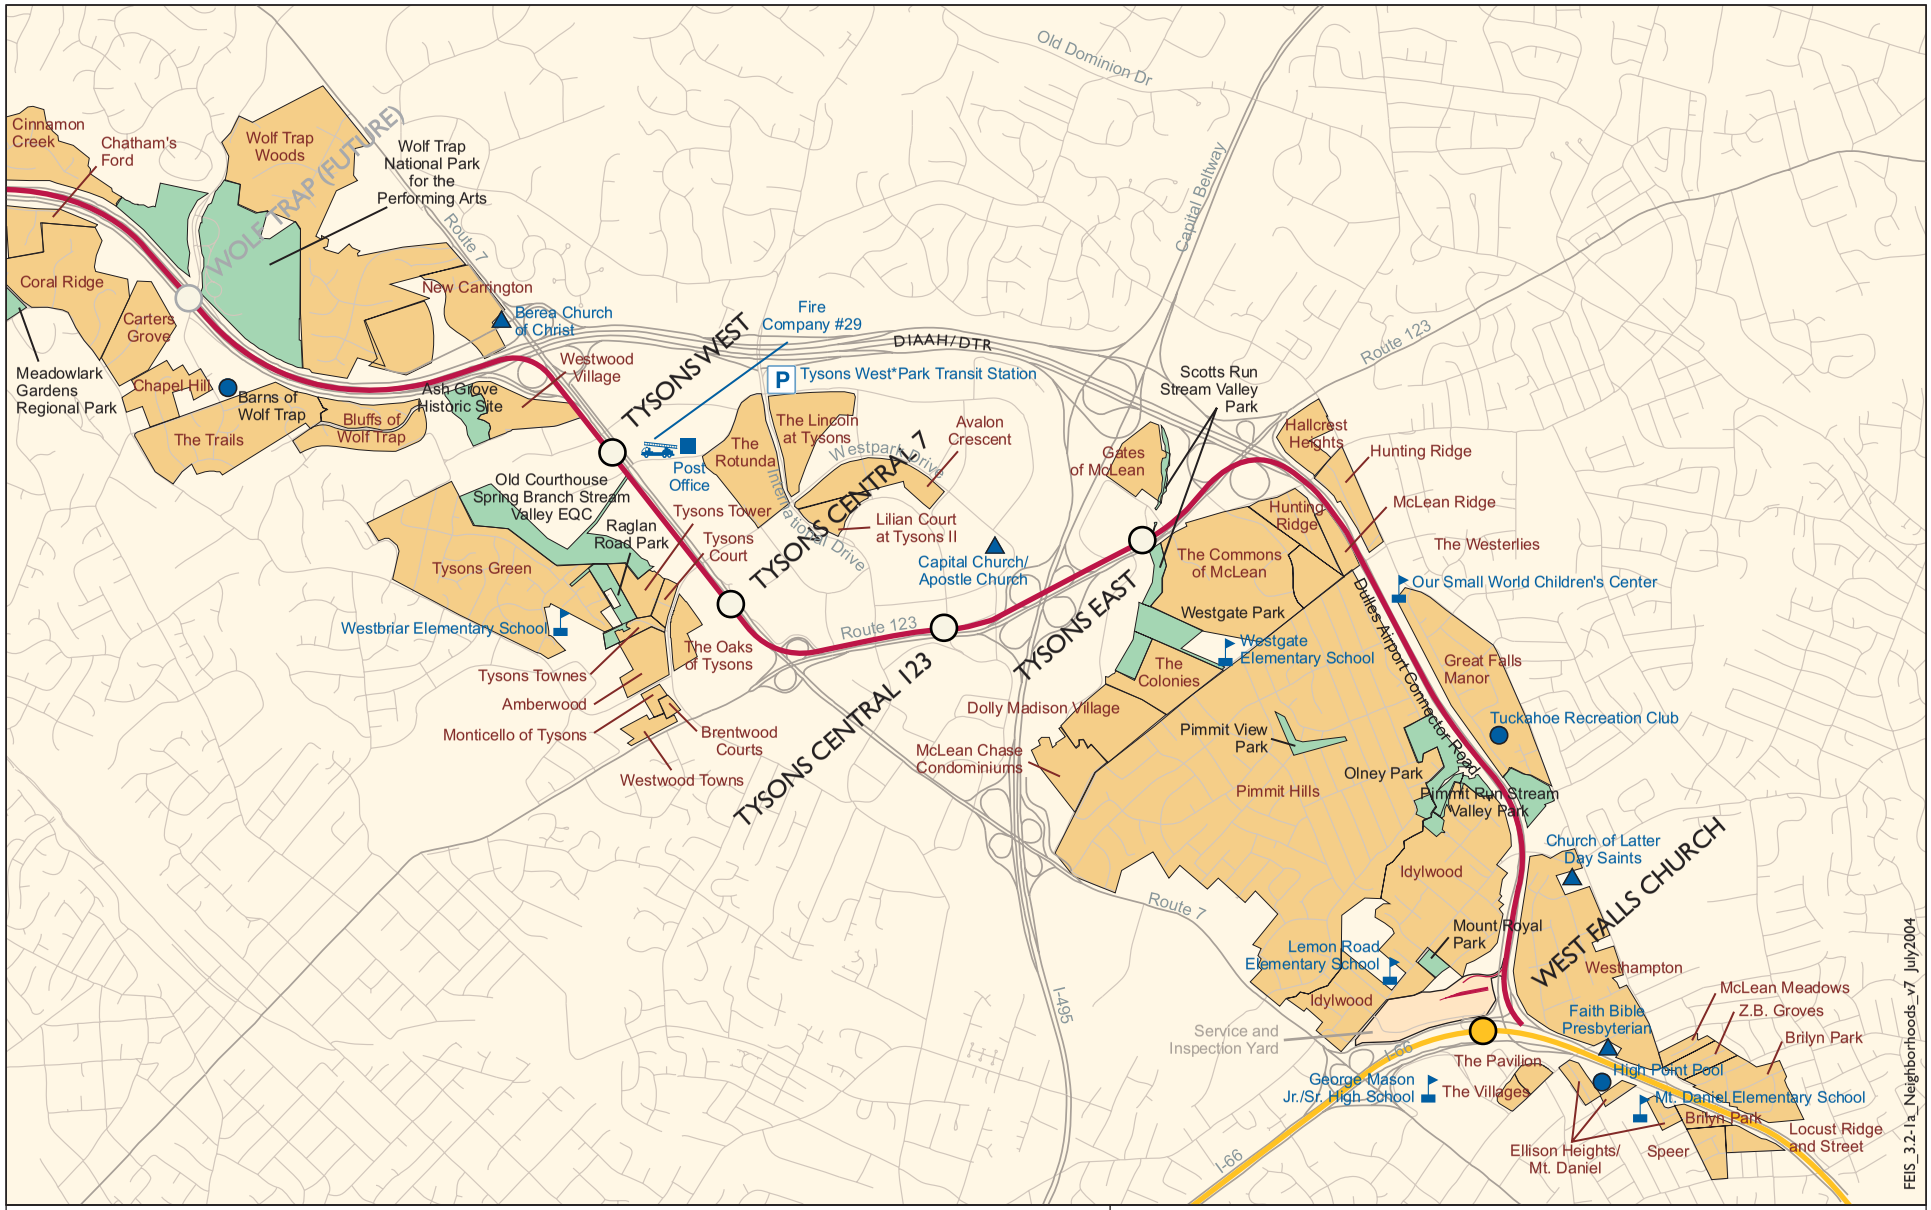
This section covers potential impacts to neighborhoods, social groups, community services, and community cohesion in the study area defined for the Dulles Corridor Rapid Transit Project. Sources of information about neighborhoods and community facilities included Fairfax and Loudoun county governments, field surveys, Alexandria Drafting Company (ADC) street maps, and U.S. Census data. Changes in neighborhoods and community facilities were identified through review of comprehensive

plans, real estate development proposals, and through coordination with Fairfax and Loudoun county officials and local community organizations.

Neighborhoods within 300 feet of the centerline of the LPA and within one half-mile of the proposed station areas were included in the study area. This initial study area was selected after a review of the anticipated limits of disturbance (a half mile at stations) for the proposed improvements. Additional neighborhoods and community facilities were added to this study area based on the outcome of the noise, vibration, air quality and visual impact analyses. The study areas for noise, vibration, air quality and visual effects were not dependent on the project's anticipated limit of disturbance. For example, noise impacts were analyzed within 1,000 feet of the proposed alignment. Generally, noise impacts from the types of facilities proposed are not expected to exceed 200 to 400 feet, depending on the topography. However, the study area for noise was broadened to ensure that all potential effects would be captured. Traffic analyses were also conducted for areas outside of the 300-foot boundary including intersections and routes that provide access to the stations. For the visual effects analysis the study area changes along the entire length of the corridor based on topography and the type and scale of existing development (see Section 3.4 for details). The 300-foot buffer and half-mile radii were the starting point and focus for the direct community impact assessment. Any other neighborhoods that were projected to have dispersed effects outside of this boundary were added to the neighborhood analysis.

Impacts to neighborhoods, communities and community services were assessed using techniques described in the *Federal Highway Administration's Community Impact Assessment: A Quick Reference for Transportation*. Areas of assessment and their effects on communities include:

- Changes in population and employment;
- Community cohesion and interaction;
- Isolation effects;
- Social values – social groups benefited or harmed;
- Barrier effects;
- Noise and vibration;
- Physical intrusions – dust, odor, light;
- Access changes – bicycle, pedestrian, transit, and vehicular;
- Community facility impacts;
- Displacements;
- Safety – pedestrian and bicyclists, crime, and emergency response; and
- Property values.



In many cases, details on specific impacts, such as noise and vibration, traffic access, and property value impacts are detailed in other sections of this Final EIS. In this section, overall impacts to the communities within the corridor are assessed. This assessment also addressed the requirements of Executive Order 13045, *Protection of Children from Environmental Health Risks.* This Order requires federal agencies, as part of their programs and policies, to consider such risks and ensure that federal standards take into account special risks to children. Profiles of the study area were prepared to identify the presence of social groups and persons over the age of 65 or less than 18 years old. No concentrations of these two groups was identified in the study area.

3.2.2 EXISTING CONDITIONS

The Dulles Corridor includes neighborhoods within Fairfax and Loudoun counties, as well as the Town of Herndon. Many of the neighborhoods are located close to the Dulles Connector Road, the DIAAH, and Dulles Toll Road. In Tysons Corner, Reston, and Loudoun County, the neighborhoods studied are generally located within a half-mile of the station areas.

3.2.2.1 Neighborhood Characteristics

The neighborhoods within the study area are depicted on Figures 3.2-1 (a-c). The characteristics of these neighborhoods are described further in Table 3.2-1, as they occur along the corridor from east to west.

Reflection Woods and Reflection Lake	North of the DIAAH and Dulles Toll Road, west of Elden Street	SF/TH	Parcher Avenue	None
Dulles Green	Astoria Circle	TH/A	Rock Hill Road	None
The Regency	Between Waxpool, Shellhorn, and Ryan Roads	SF	Waxpool Road	None
Comstock Crossing	On Waxpool Road near the intersection with Shellhorn Road	TH	Waxpool Road	None
Groves at Flynn's Crossing	Blossom Road Terrace	A	Ryan Road	None

SF – Single Family
TH – Townhouse
A – Apartment
C - Condominium

3.2.2.2 Community Facilities and Services

Community facilities include hospitals, parks, places of worship, day care centers, schools, government offices such as post offices, police and fire stations, cultural centers, and special service providers. These facilities provide services to the residents and visitors of the corridor. Community facilities also

contribute to community cohesion of the neighborhoods in which they are located and are viewed as valuable amenities to the residents in the study area, as defined in Section 3.3.1.

Existing community facilities are located throughout the corridor. These community facilities are shown in Figures 3.2-1 (a-c), and listed in Table 3.2-2, as they occur in the corridor from east to west.

Table 3.2-2: Community Facilities and Services in Study Area

Community Facility or Service	Location
Mt. Daniel Elementary School	2328 Oak Street, Falls Church
Highpoint Pool	6840 Woodland Drive, Falls Church
Faith Bible Presbyterian Church	6901 Haycock Road, Falls Church
George Mason Jr./Sr. High School	7124 Leesburg Pike (at Haycock Road), Falls Church
Mount Royal Park	7141 Idylwood Road (at Idylwood Court), McLean
Lemon Road Elementary School	7230 Idylwood Road, McLean
Church of Latter Day Saints	Greenwich Street at Kirby Road, McLean
Pimmit Run Stream Valley Park	Old Dominion Road and Leesburg Pike, McLean
Tuckahoe Recreation Club	1814 Great Falls Street, McLean
Olney Park	1840 Olney Road, McLean
Our Small World Children's Center	1700 Great Falls Street, McLean
Pimmit View Park	1905 Storm Drive, McLean
Westgate Elementary School	7500 Magarity Road, Falls Church
Westgate Park	7508 Magarity Road, Falls Church
Scotts Run Stream Valley Park	Meadow Road and Tremayne Place, McLean
Capital Church*	7903 Westpark Drive, McLean
Apostle Mission Church*	7903 Westpark Drive, McLean
McLean Hamlet Park	8119 Dunsinane Court (north of Dulles Toll Road), McLean
Spring Hill Elementary School	8201 Lewinsville Road, McLean
Tysons-West*Park Transit Station	8300 Jones Branch Drive, McLean
Shiloh Baptist Church	1331 Spring Hill Road (Lewinsville Road east of International Drive), McLean
Charity Baptist Church	1328 Spring Hill Road (International Drive and Lewinsville Road), McLean
U.S. Postal Office	1544 Spring Hill Road south of Tyco Road, McLean
Fire Company #29	1560 Spring Hill Road, McLean
Raglan Road Park	8590 Raglan Road, Tysons Corner
Westbriar Elementary School	1741 Pine Valley Drive, Tysons Corner
Old Courthouse Spring Branch Stream Valley Environmental Quality Corridor	West of Tysons Corner
Berea Church of Christ	8817 Leesburg Pike, McLean
Ash Grove Historic Site	Leesburg Pike and Dulles Toll Road, Vienna
Barns of Wolf Trap	1624 Trap Road (south of Dulles Toll Road), Vienna
Wolf Trap National Park for the Performing Arts	1551 Trap Road (north of Dulles Toll Road), Vienna
Meadowlark Gardens Regional Park	9750 Meadowlark Gardens Court, Vienna
Jehovah's Witnesses Congregation of Vienna	Beulah Road and Dulles Toll Road, Vienna
Wolf Trap Stream Valley Park	Coral Bells Court west of Beulah Road, Vienna
Sun Valley Park	Between Abbey Oak Drive and Dulles Toll Road, Vienna
Tamarack Park	Abbey Oak Drive and Nevar Court, Vienna
Difficult Run Stream Valley Park	Meadowlark Road south of Dulles Toll Road, Vienna
Cartersville Baptist Church	Hunter Mill Road north of Sunrise Valley Drive, Reston
Reston Presbyterian Church	10610 Sunset Hills Boulevard (Hunter Mill Road north of Dulles Toll Road), Reston
W&OD Railroad Regional Park	Throughout Mid-Corridor

Community Facility or Service	Location
Lake Thoreau	South of Sunrise Valley Drive, Reston
Lake Thoreau Pool	Sunrise Valley Drive and Upper Lake, Reston
Boston Ridge Playfield	Sunrise Valley Drive and Headlands Circle, Reston
Upper Lake Tennis Courts	Sunrise Valley Drive and Upper Lake, Reston
Fire Company #25	1820 Wiehle Avenue, Reston
Reston East Park-and-Ride	North of Dulles Toll Road and Wiehle Avenue, Reston
VDOT Park-and-Ride	Sunset Hills Road and Wiehle Avenue, Reston
Hidden Creek Country Club Golf Course	1711 Clubhouse Road, Reston
Good Beginnings School	11501 Sunrise Valley Drive, Reston
Reston National Golf Course	South of Sunrise Valley Drive, Reston
Newbridge Recreation Area	Newbridge Court south of Sunrise Valley Drive, Reston
YMCA	12196 Sunset Hills Road, Reston
Haley Smith Park	Van Buren and Herndon Parkway, Herndon
Montessori Country School	612 Alabama Drive, Reston
Herndon - Monroe Park-and-Ride	Fairfax County Parkway and Monroe Street, Reston
Sunrise Valley Park Wildlife Habitat and Nature Preserve	Sunrise Valley Drive and Monroe Avenue, Reston
Reston Montessori School	1928 Isaac Newton Square
Sunset Hills Montessori	11180 Ridge Heights Round, Reston
Mulberry Childcare and Preschool	1946 Isaac Newton Square
Chandon Park	900 Palmer Drive, Herndon
Hutchison Elementary School	13209 Parcher Avenue, Herndon
Soccer Fields	Farougi Court north of the Dulles Toll Road, Herndon
Center for Innovative Technology	2214 Rock Hill Road, Herndon

* Both Apostle Mission and Capital Churches are temporarily renting the facility located at 7903 Westpark Drive from West Group Properties, LLC.

3.2.3 LONG-TERM EFFECTS

The long-term effects of the No Build Alternative and the LPA on neighborhoods and community facilities are described in the following sections. Table 3.2-3 presents a summary of these effects.

Table 3.2-3: Summary of Long-Term Effects to Neighborhoods and Community Facilities

Community Effects	No Build Alternative (2025)	Locally Preferred Alternative		
		Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Changes in Population and Employment	Any effects are due to existing highway and transit infrastructure and services within the corridor and improvements that are committed to be implemented by 2025	The Westerlies, The Commons of McLean, Gates of McLean, The Colonies, Dolley Madison Village and McLean Chase Condominiums, Lillian Court at Tysons II, Avalon Crescent, The Lincoln at Tysons II, Rotonda, Tysons Tower, The Oaks of Tysons, Tysons Court, Brentwood Courts, Monticello of Tysons, Tysons Townes, Westwood Towns, Amberwood, Tysons Green, Westwood Village, Lakeport, Upper Lake, Winterport/Boston Ridge, Great Meadows, Wethersfield, Hunters Green, and Newbridge	The Westerlies, The Commons of McLean, Gates of McLean, The Colonies, Dolley Madison Village and McLean Chase Condominiums, Lillian Court at Tysons II, Avalon Crescent, The Lincoln at Tysons II, Rotonda, Tysons Tower, The Oaks of Tysons, Tysons Court, Brentwood Courts, Monticello of Tysons, Tysons Townes, Westwood Towns, Amberwood, Tysons Green, Westwood Village, Lakeport, Upper Lake, Winterport/Boston Ridge, Great Meadows, Wethersfield, Hunters Green, and Newbridge	The Westerlies, The Commons of McLean, Gates of McLean, The Colonies, Dolley Madison Village and McLean Chase Condominiums, Lillian Court at Tysons II, Avalon Crescent, The Lincoln at Tysons II, Rotonda, Tysons Tower, The Oaks of Tysons, Tysons Court, Brentwood Courts, Monticello of Tysons, Tysons Townes, Westwood Towns, Amberwood, Tysons Green, Westwood Village, Lakeport, Upper Lake, Winterport/Boston Ridge, Great Meadows, Wethersfield, Hunters Green, Newbridge, Indian Ridge, Stratford, South Gate, West Market, Polo Fields, Woodland Park, The Downs, President's Court, Chandon Woods, Worldgate, Reflection Woods, Reflection Lake, Dulles Green, Rock Hill, the Regency, Comstock Crossing, the Groves at Flynn's Crossing
Community Cohesion and Interaction	Potential for some impact to cohesion associated only with other projects, none have been identified specifically for neighborhoods in this study area	No effect	No effect	No effect
Isolation Effects	Potential for some impact to cohesion associated only with other projects, none have been identified specifically for neighborhoods in this study area	No effect	No effect	No effect
Social Values – Social Groups Valued or Harmed	No effect identified on communities in study area	No effect	No effect	No effect

Community Facility Impacts	No effect identified on any community facilities or services in study area.	Traffic congestion at Fire Company #25 on Wiehle Avenue. Longer and more frequent traffic queing in the vicinity of Sunrise Valley Drive and Wiehle Avenue	Traffic congestion at Fire Company #25 on Wiehle Avenue. Longer and more frequent traffic queing in the vicinity of Sunrise Valley Drive and Wiehle Avenue	Traffic congestion at Fire Company #25 on Wiehle Avenue. Longer and more frequent traffic queing in the vicinity of Sunrise Valley Drive and Wiehle Avenue
Displacements	Some displacements could be associated with other projects in No Build Alternative	No Effect	No Effect	No Effect
Safety – Pedestrian/ Bicyclists; Crime/ Emergency	No effect identified on communities in study area. Traffic projected to increase in neighborhoods.	Slight increase in local vehicular traffic volumes in all station areas. Pedestrian bridges across existing roadways are planned to improve safety for the following stations: Tysons East, Tysons Central 123, Tysons Central 7, Tysons West, and Wiehle Avenue.	Slight increase in local vehicular traffic volumes in all station areas. Pedestrian bridges across existing roadways are planned to improve safety for the following stations: Tysons East, Tysons Central 123, Tysons Central 7, Tysons West, and Wiehle Avenue.	Slight increase in local vehicular traffic volumes in all station areas. Pedestrian bridges across existing roadways are planned for the following stations: Tysons East, Tysons Central 123, Tysons Central 7, Tysons West, Wiehle Avenue, Reston Parkway, Herndon-Monroe, Route 28, and Route 772.

Community Effects	No Build Alternative (2025)	Locally Preferred Alternative		
		Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Property Values adjacent to Metrorail Stations	No new Metrorail Stations; current trends continue	**Neighborhoods within Station Areas where Property Values May Increase due to 5 new Stations:** The Westerlies, The Commons of McLean, Gates of McLean, The Colonies, Dolley Madison Village and McLean Chase Condominiums, Lillian Court at Tysons II, Avalon Crescent, The Lincoln at Tysons II, Rotonda, Tysons Tower, The Oaks of Tysons, Tysons Court, Brentwood Courts, Monticello of Tysons, Tysons Townes, Westwood Towns, Amberwood, Tysons Green, Westwood Village, Lakeport, Upper Lake, Winterport/Boston Ridge, Great Meadows, Wethersfield, Hunters Green, and Newbridge.	**Neighborhoods within Station Areas where Property Values May Increase due to 5 new Stations:** The Westerlies, The Commons of McLean, Gates of McLean, The Colonies, Dolley Madison Village and McLean Chase Condominiums, Lillian Court at Tysons II, Avalon Crescent, The Lincoln at Tysons II, Rotonda, Tysons Tower, The Oaks of Tysons, Tysons Court, Brentwood Courts, Monticello of Tysons, Tysons Townes, Westwood Towns, Amberwood, Tysons Green, Westwood Village, Lakeport, Upper Lake, Winterport/Boston Ridge, Great Meadows, Wethersfield, Hunters Green, and Newbridge.	**Neighborhoods within Station Areas where Property Values May Increase due to 11 new Stations:** The Westerlies, The Commons of McLean, Gates of McLean, The Colonies, Dolley Madison Village and McLean Chase Condominiums, Lillian Court at Tysons II, Avalon Crescent, The Lincoln at Tysons II, Rotonda, Tysons Tower, The Oaks of Tysons, Tysons Court, Brentwood Courts, Monticello of Tysons, Tysons Townes, Westwood Towns, Amberwood, Tysons Green, Westwood Village, Lakeport, Upper Lake, Winterport/Boston Ridge, Great Meadows, Wethersfield, Hunters Green, Newbridge, Indian Ridge, Stratford, South Gate, West Market, Polo Fields, Woodland Park, The Downs, President's Court, Chandon Woods, Worldgate, Reflection Woods, Reflection Lake, Dulles Green, Rock Hill, the Regency, Comstock Crossing, the Groves at Flynn's Crossing.

3.2.3.1 No Build Alternative

The No Build Alternative would not produce mobility benefits beyond those that would be provided by planned future transportation projects and improvements. This alternative would not cause any changes to the currently anticipated future changes in population, employment, community cohesion or isolation. The No Build Alternative would not cause any additional residential displacements, safety impacts or changes in property values beyond those anticipated to occur due to planned future transportation projects.

Current trends in property values indicate that values are likely to increase regardless of the implementation of the Dulles Corridor Rapid Transit Project. No new Metrorail Stations would be built under the No Build. Therefore, it is expected that current trends in property values would continue.

3.2.3.2 Wiehle Avenue Extension

The Wiehle Avenue Extension would be primarily located within a transportation right-of-way, therefore no isolation effects or community cohesion effects are projected for 2011 or 2025. Several communities throughout the corridor would be affected by noise. The neighborhoods affected by noise would be Victoria Farms, Westwood Village, New Carrington, Coral Ridge, Brilyn park, Westhampton, Great Falls

Manor, Hunting Ridge, Hallcreast Heights, McLean Ridge, Commons of McLean, Ellison Heights/Mt. Daniel, Idylwood, and Pimmit Hills since these neighborhoods would be located close to the proposed alignment. The proximity of the Hunting Ridge and Westwood Village neighborhoods to the alignment would cause these neighborhoods to experience some additional effects such as light intrusions.

According to the *Fairfax County Comprehensive Plan*, higher density redevelopment and in-fill development could be constructed in the transit station areas, which would add population and employment in the area. The potential increases in population and employment could increase traffic volumes and the use of community facilities as well as change the character of development at the transit stations.

Five Stations are planned under the Wiehle Avenue Extension. Historically where Metrorail Stations have been constructed and are in operation in Northern Virginia, such as the Clarendon and Ballston Stations in Arlington, adjacent properties have experienced an increase in value. It is expected that these trends would continue.

All of the neighborhoods located near station facilities could experience increases in traffic congestion, population, and employment as a result of the station locations and potential future development. However, the overall traffic impact in the corridor is localized to specific streets in the vicinity of the station areas. This increase in vehicular traffic could affect pedestrian safety at each station location.

Implementation of the Wiehle Avenue Extension could result in longer and more frequent traffic queing in the vicinity of Fairfax County Fire Company #25 at the intersection of Sunrise Valley Drive and Wiehle Avenue and could affect egress and access to the station. Fairfax County Fire Company #25 currently has pre-emptive traffic signal to control the flow of traffic.

Under Wiehle Avenue Extension, neighborhoods located west of Wiehle Avenue would not receive mobility benefits from access to Metrorail service. Neighborhoods located within a half-mile of the Herndon-Monroe park-and-ride would receive access to transit service via the proposed Express Bus Service.

3.2.3.3 Full LPA

In addition to the effects described under the Wiehle Avenue Extension, one additional neighborhood, Reflection Woods would experience an increase in noise under the full LPA.

One additional community facility, the interim use soccer fields north of the DIAAH and Dulles Toll Road, would be affected by the Route 28 Station. The soccer fields would be converted to a transit facility per the terms and conditions set forth in the Dulles Green Proffer. Excerpts from this proffer statement are included in Appendix I.

Eleven stations are planned under the full LPA. Historically where Metrorail Stations have been constructed and are in operation in Northern Virginia, such as the Clarendon and Ballston Stations in Arlington, adjacent properties have experienced an increase in value. It is expected that these trends would continue.

3.2.4 CONSTRUCTION EFFECTS

The following sections detail the short-term construction effects to neighborhoods of the No Build Alternative and the LPA.

3.2.4.1 No Build Alternative

Under the No Build Alternative, there would be no construction effects from the Dulles Corridor Rapid Transit Project. However, construction-related impacts to neighborhoods and community facilities could result from the improvements assumed as part of this alternative. Identification of these effects would be the responsibility of the agencies and jurisdictions implementing the improvements.

3.2.4.2 Wiehle Avenue Extension

During construction of the Wiehle Avenue Extension, construction-related traffic, noise, air quality, and visual impacts would occur. These impacts are addressed in the individual topic sections. Generally, these short-term impacts would not affect most of the neighborhoods because they are not located immediately adjacent to the proposed alignment or stations where major construction would occur, or they are already buffered from the transportation corridor.

The Idylwood neighborhood would experience noise effects and some additional truck traffic during construction of the improvements to the West Falls Church S&I Yard. Three neighborhoods, Hunting Ridge, McLean Ridge, and Westwood Village would experience physical intrusions, such as light, dust and odors during the construction of the alignment in Tysons Corner. Additionally, the construction of the median stations would be visible to the Pavilion neighborhood. West of the Wiehle Avenue Station, construction of enhanced bus facilities would not affect neighborhoods or community facilities.

3.2.4.3 Full LPA

In additional to the effects described under the Wiehle Avenue Extension, the Reflection Woods, Reflection Lake and Dulles Green neighborhoods would experience construction effects such as, light, dust and visual effects from construction equipment under the full LPA.

3.2.5 MITIGATION

Mitigation strategies for impacts upon neighborhoods in the corridor would focus on reducing noise, visual, traffic, and construction effects. These are discussed in their respective sections of the Final EIS.

3.3 PROPERTY ACQUISITION AND DISPLACEMENTS

This section presents information regarding the property acquisitions (partial or full) and displacements that would occur as a result of the Dulles Corridor Rapid Transit Project. Federal and state laws require that property owners be paid fair market value for their land and improvements, and that they be assisted in finding replacement business sites or dwellings. Displacements result from right-of-way acquisitions that require the use of a property occupied by a residence or business. Partial acquisitions occur when only a portion of an existing land use is required and as such may not result in a displacement or relocation. Full acquisitions occur when a complete parcel is required and may result in either a displacement or relocation.

3.3.1 LEGAL AND REGULATORY CONTEXT

Under the Uniform Relocation Assistance and Real Property Acquisition Policy Act of 1970, as amended, all federal agencies are required to meet certain standards for the fair and equitable treatment of persons displaced by federally supported actions. Relocation assistance will follow the guidelines set forth in Title 49, Part 24 of the Code of Federal Regulations (49 CFR Part 24).

3.3.2 METHODOLOGY

To identify potential acquisitions and displacements that would occur from implementing the Dulles Corridor Rapid Transit Project, the limit of disturbance for the LPA was overlaid onto corridor parcel maps. Each of the parcels was then analyzed to determine if an acquisition was necessary and if the acquisition would displace a residence, business, community facility, or institutional use. If land is acquired that does not include a residence, business, or institutional use, a displacement does not occur. Conversely, a partial acquisition could result in a displacement, even if it does not take a building. If a partial acquisition results in the inability to use the parcel as it was used prior to the acquisition, it could result in a full displacement. For example, if all of the parking was taken from a business, then the business would not be able to remain open and a displacement would occur. Land proffered for transit facilities by private landowners and land required from public agencies (Fairfax and Loudoun counties, Virginia Department of Transportation, MWAA) has not been analyzed for displacements.

3.3.3 LONG-TERM EFFECTS

The long-term effects of the No Build Alternative, the Wiehle Avenue Extension, and the full LPA that would result in partial or complete acquisitions of land parcels and displacements are described in the following sections. Table 3.3-1 presents a summary of these effects. Temporary uses of land for construction are discussed in Section 3.3.5.

Table 3.3-1: Acquisitions and Displacements

Acquisition Type	No Build Alternative (2025)	Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Private Residential Parcels (partial acquisitions)	0	11 (3.9 acres)	11 (3.9 acres)	11 (3.9 acres)
Private Commercial Parcels	0	37 (13.4 acres)	37 (13.4 acres)	64 (28.1 acres)
Government and Proffered Parcels	0	14 (15.0 acres)	14 (15.0 acres)	36 (166.0 acres)
Total Parcels	**0**	**62 (32.3 acres)**	**62 (32.3 acres)**	**111 (198.0 acres)**
Residential Displacements	0	0	0	0
Business Displacements	0	3	3	3

Notes:
1. Only partial acquisitions are required for all residential and most commercial parcels.
2. Property requirements are preliminary and subject to change based on negotiations with property owners and further design refinement.

3.3.3.1 No Build Alternative

Under the No Build Alternative, there would be no direct effects from the Dulles Corridor Rapid Transit Project. However, displacements or relocations could occur as a result of some of the projects assumed under this alternative. Identification of these effects would be the responsibility of the agencies and jurisdictions implementing the improvements.

3.3.3.2 Wiehle Avenue Extension

The property acquisition effects associated with the Wiehle Avenue Extension would require partial acquisition (or easement) of two residential properties for ancillary facilities located along the Dulles Connector Road, but would not cause any displacements. The line and track for the Wiehle Avenue Extension would require 15 partial acquisitions from commercial properties located along Routes 123 and 7.

The Tysons Central 123 station would require partial acquisition of one commercial parcel. This acquisition would not require the removal of structures or preclude existing uses on the remaining portions of the parcel. At the Tysons Central 7 Station, one auto repair business would be displaced for the north entrance pavilion and three partial acquisitions of commercial parcels would be required for the station and south entrance pavilion.

At the Tysons West Station, partial or complete land acquisitions would be required from eight parcels. The majority of the right-of-way required is for the bus bays and Kiss & Ride facilities. This acquisition would displace two businesses (an auto collision center and car rental office). These businesses would have their operations affected by the loss of a limited number of parking spaces and some alteration of on-site circulation and access.

Between the Tysons West and Wiehle Avenue stations, partial acquisitions of nine residential and two commercial parcels would be required along the alignment for ancillary facilities including stormwater management facilities, traction power substations, and tie-breakers. These ancillary facilities would not result in any displacements.

At the Wiehle Avenue Station, complete or partial acquisitions of six commercial parcels would be required. Construction of an access road would require removal of some structures from an existing storage business. West of Wiehle Avenue Station, partial acquisition from one commercial property would be required along the alignment for a tie-breaker station. The facility would not result in a displacement.

The Wiehle Avenue Extension requires the acquisition of property interest in the median and other parts of the Dulles International Airport Access Highway and Dulles Connector Road. The U.S. Department of Transportation (USDOT) owns the Access Highway and Connector Road. MWAA has leased the property from the USDOT through the year 2067. DRPT will seek conveyance of the Access Highway and Connector Road property interest needed for the Project from the USDOT and MWAA. The acquired property interest will be adequate to assure DRPT's or WMATA's continuing control of the Project property throughout the useful life of the Project.

3.3.3.3 Full LPA

The effects associated with the full LPA would be similar to those described for the Wiehle Avenue Extension in areas east of and including the Wiehle Avenue station area.

At the Reston Parkway Station, three partial acquisitions of commercial properties would be required, but would not result in any displacements.

Between the Reston Parkway and Herndon-Monroe stations, partial acquisition (or an easement) of four commercial properties would be required long the alignment for ancillary facilities. The facilities would not

result in any displacements. At the Herndon-Monroe Station, four partial acquisitions of commercial properties would be required, but not result in any displacements.

Between the Herndon-Monroe and Route 28 stations, partial acquisition (or an easement) of one commercial property would be required along the alignment for a stormwater management pond. The facility would not result in a displacement. At the Route 28 Station, five partial acquisitions of commercial properties would be required, but would not result in any displacements.

The full LPA requires the acquisition of property interest in the median and other parts of the Dulles International Airport Access Highway and Dulles Connector Road, and in parts of the Dulles Airport property itself, including the site of the S&I Yard and portions of eight parcels that are currently leased to commercial entities. The USDOT owns the Access Highway, the Connector Road and the Dulles Airport property. MWAA has leased the property from the USDOT through the year 2067 and has sublet certain commercial parcels to businesses. DRPT will seek conveyance of the Access Highway, Connector Road and Airport property interest needed for the Project from the USDOT and MWAA. The acquired property interest will be adequate to assure DRPT's or WMATA's continuing control of the project property throughout the useful life of the project.

As the alignment leaves the airport property, and transitions into the median of the Dulles Greenway, it traverses private property requiring the partial acquisition of one commercial property. Between Route 606 and Route 772, partial acquisition of three commercial parcels would be required along the alignment for ancillary facilities.

3.3.4 CONSTRUCTION EFFECTS

Construction effects on property displacements, relocations, or acquisitions (partial or full) that would occur due to the Dulles Corridor Rapid Transit Project are presented in this section. Construction staging areas would be required for temporary use during the construction period. The locations of the construction staging areas are illustrated in Figure 2.3-3. In most cases, the construction staging areas are located within existing transportation rights-of-way.

3.3.4.1 No Build Alternative

No construction effects would result from the No Build Alternative.

3.3.4.2 Wiehle Avenue Extension

The project has identified seven sites for which property required for construction staging would be leased or otherwise acquired for temporary use. None of the property acquired would require permanent displacements or impede existing activities. Therefore, no short-term construction impacts related to displacements or relocations would occur.

3.3.4.3 Full LPA

Property required for construction staging would be leased or otherwise acquired for temporary use at one site in addition to the seven sites for the Wiehle Avenue Extension. None of the property acquired would require permanent displacements or impede existing activities. Therefore, no short-term construction impacts related to displacements or relocations would occur.

3.3.5 MITIGATION

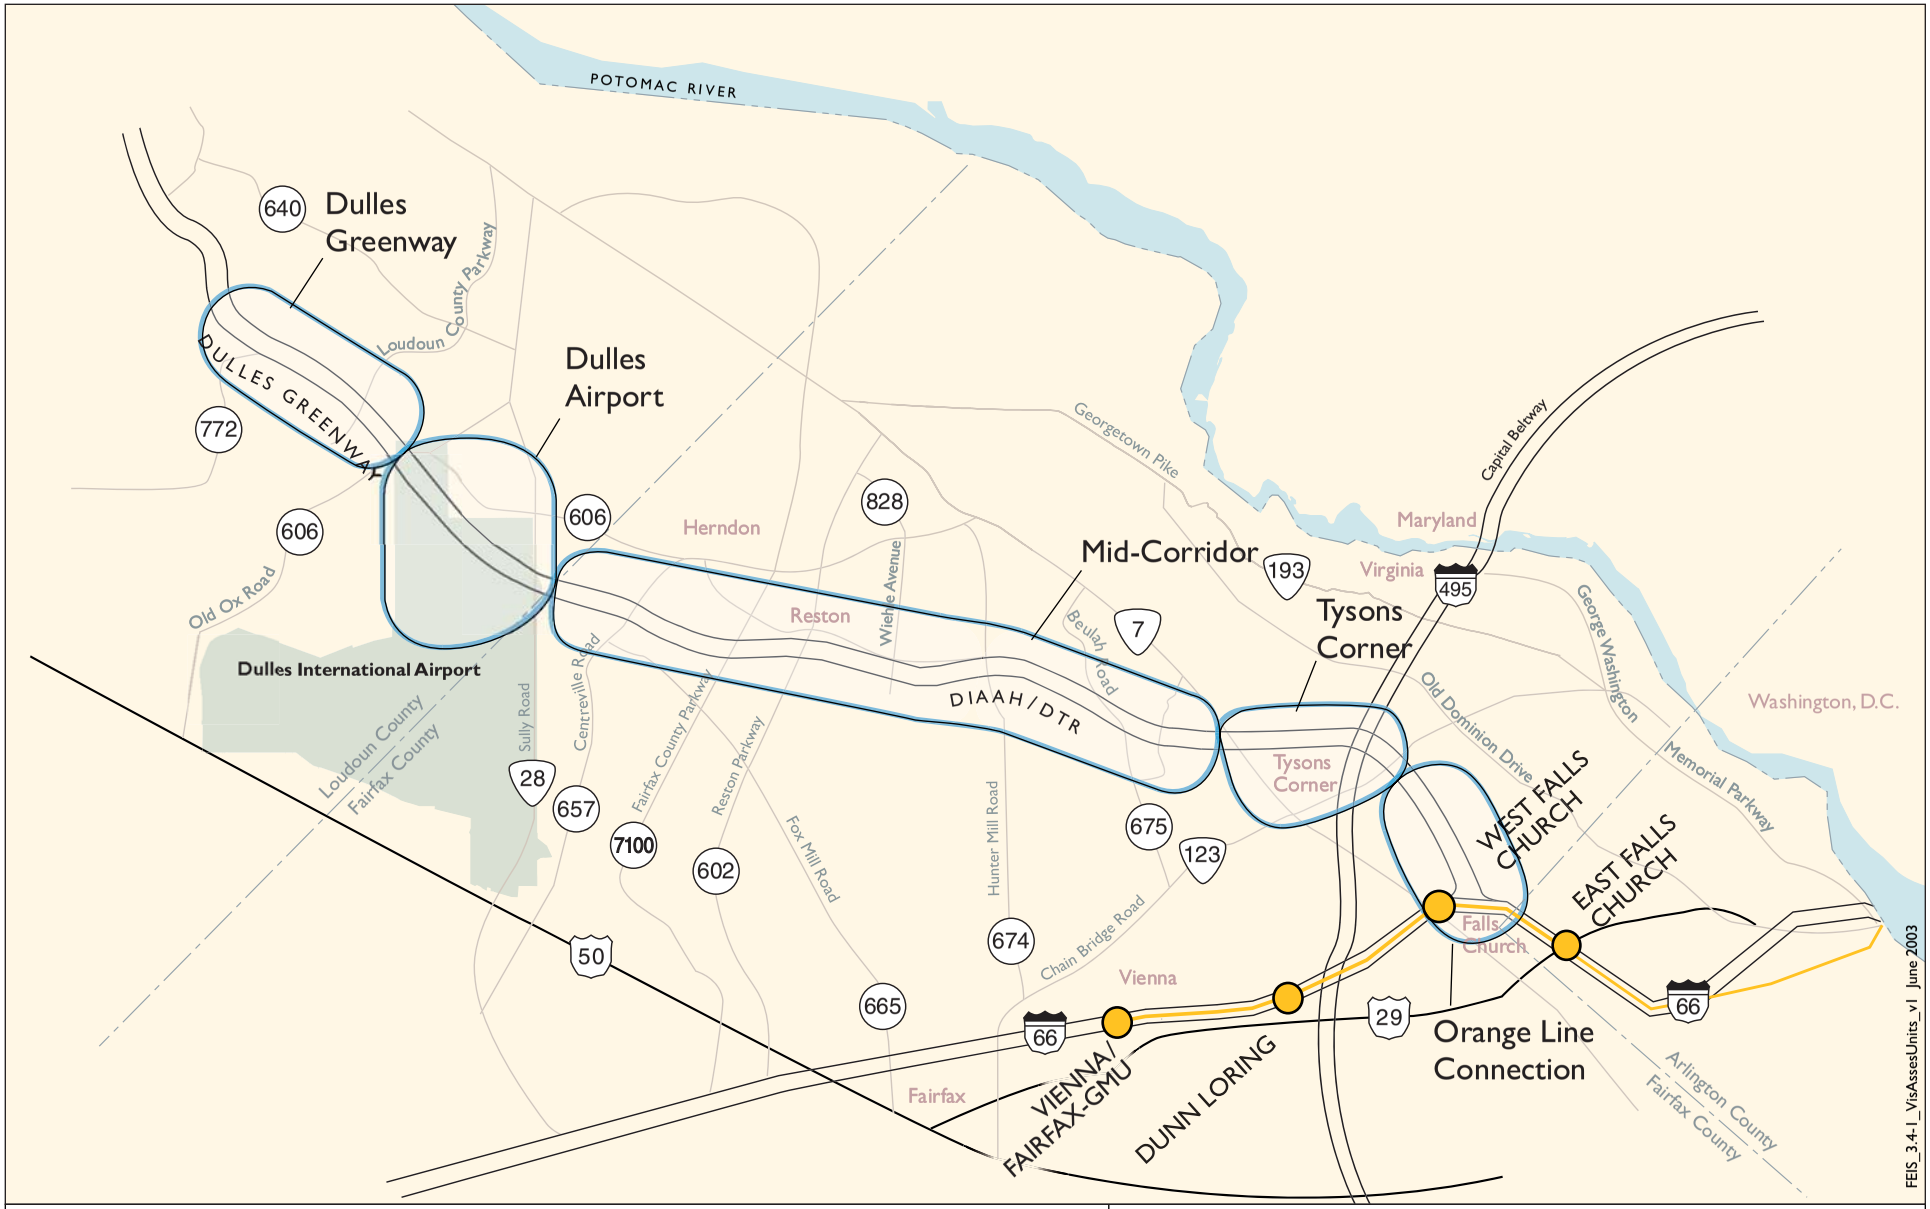
The acquisition of right-of-way and the relocation of displacees would be conducted in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policy Act of 1970, as amended. Relocation resources would be made available to all residential, business, and nonprofit displacees without discrimination. DRPT would prepare a detailed acquisition and relocation plan prior to initiating any property acquisition or relocation activities.

3.4 VISUAL AND AESTHETIC CONDITIONS

This section presents the results of a visual impacts analysis of the proposed Dulles Corridor Rapid Transit Project.

3.4.1 METHODOLOGY

The Federal Transit Administration (FTA) does not have a specific methodology or set of guidelines for conducting visual assessments of transit projects. As is the generally accepted practice, the Federal Highway Administration (FHWA) visual assessment methodology was applied for this analysis. The following steps were used in the analysis:



1. The study area was defined by dividing the Dulles Corridor into visual assessment units, which are relatively homogeneous areas of similar visual character. Figure 3.4-1 illustrates the boundaries of these visual assessment units.
2 Each visual assessment unit was evaluated for existing visibility, visual character, quality of views, and presence of important visual resources.
3. The types of viewers present in each visual assessment unit were identified. Different types of viewers have different levels of sensitivity to visual changes based on their familiarity with the environment, what they are doing, how much time they spend looking at the environment, and their sense of ownership of the view.
4. Project plans, photographs, computer-generated visual simulations, and artist renditions of the project were reviewed regarding the visible physical changes that would occur.
5. The visual impact of the project's visible physical changes was assessed and classified into three basic categories: substantial, minimal, and negligible visual impacts. Substantial visual impacts of a transportation project a re those that would result in a deterioration in the ability to use the adjacent land as intended, a reduction in the quality of that use, obstruction of an important view, interference with a specific design in the environment, degradation of a natural condition, removal of a substantial percentage, or the last amount of, landscaping or natural vegetation, and similar levels of visual disturbance. Minimal impacts are those visual effects that do not produce these conditions. Negligible impacts are those where the visible changes would be barely noticeable to the general public.
6. If substantial visual impacts were identified, mitigation was developed, if available, to reduce the impacts.

3.4.2 EXISTING CONDITIONS

The Dulles Corridor is located within an area that has undergone and is undergoing continued development. In the last few years, office, industrial, and mixed-use development has occurred in much

of the study area, especially in the vicinity of Tysons Corner, Reston, Herndon, and more recently, Loudoun County. Portions of the corridor contain older residential developments.

For visual analysis purposes, the corridor can be divided into five distinct regions, referred to as visual assessment units. From east to west, these are the Orange Line Connection, Tysons Corner, Mid-Corridor, Dulles Airport, and Dulles Greenway visual assessment units. The existing visual conditions in each of these areas are discussed below, and representative photographs of the Dulles Corridor are shown in Figures 3.4-2a through 3.4-2e. Figure 3.4-3 shows the view corridors within the Dulles Airport visual assessment unit. Table 3.4-1 summarizes the visual characteristics of each unit. Specific characteristics of each visual assessment unit can be found in the Draft EIS.

Table 3.4-1: Visual Characteristics

Visual Assessment Unit	Limits of Visual Assessment Unit	Visual Characteristics	Viewers
Orange Line Connection	Eastern end of corridor, along I-66 and Dulles Connector Road, to Dulles Connector Road/Route 123 interchange	Narrow, enclosed transportation facility with short views of landscaping, sound barriers and traffic; No distinctive views or focal points Adjacent characteristics: Mostly residential development, with small amount of industrial (WFC Yard) space at the I-66/Dulles Connector Road interchange	Highway users, users of West Falls Church Metrorail Facility Residents of homes adjacent to I-66 and Dulles Connector Road.
Tysons Corner	Route 123 interchange with Dulles Connector Road to the Dulles Toll Road at Route 7 interchange	Tall buildings and varied topography provide important views into and out of the area. Many buildings posses a distinctive architectural style, contributing to important views and focal points Adjacent characteristics: Various planned developments (large and small-scale commercial developments, hotel/restaurants, office commercial, light-industrial and multi-family residential)	Permanent and temporary residents, workers and people traveling through the area
Mid-Corridor	Route 7 crossing of the Dulles Toll Road/DIAAH to the Route 28 interchange	Narrow, enclosed transportation facility with short views of landscaping, sound barriers, and traffic Adjacent characteristics: Eastern portion mostly low-density residential; western portion mostly planned office commercial development Wolf Trap Farm Park for Performing Arts within unit Hunter Mill Road, a Virginia Scenic Byway within unit	Highway users Residents with views of Dulles Toll Road/DIAAH

Visual Assessment Unit	Limits of Visual Assessment Unit	Visual Characteristics	Viewers
Dulles Airport	Dulles Toll Road/Route 28 interchange, continues to airport, ending at Dulles Greenway	Extensive visibility due to openness of airport property; views from main terminal are limited due to lack of low windows. "Peekaboo" sequence designed by airport architect, Eero Saarinen. Adjacent characteristics: Airport related land uses dominate area; other transportation related facilities Terminal and tower are eligible for listing on NRHP	Airport workers and travelers
Dulles Greenway	Northwestern edge of the airport, adjacent to Greenway to western corridor terminus near Route 772	Relatively flat topography and low-degree of development provide extensive visibility Adjacent characteristics: Undeveloped and developing land, (mostly industrial and warehousing)	Motorists on roadways and workers in industrial buildings

3.4.3 LONG-TERM EFFECTS

Analysis of visual impacts involves visible physical changes and the reaction of viewers to the changes. The sensitivity of views affects whether a visible physical change would have an adverse or beneficial visual impact. The potential visual effects of the LPA are summarized in Table 3.4-2. More detailed descriptions of the potential visual effects are provided in Section 3.4 of the Draft EIS.

Table 3.4-2: Summary of Long-Term Visual Effects

Physical Changes	Visibility From	Types of Viewers	Viewer Sensitivity[1]	Visual Impact[2]
Orange Line Connection Visual Assessment Unit				
Metrorail alignment in Dulles Connector Road center median, including new rail yard lead, traction power substation	Dulles Connector Road	Motorists, transit riders	Moderate	Minimal
West Falls Church Metrorail Yard improvements, including additional storage tracks, traction power substation	West Falls Church Station	Transit workers	Moderate	Negligible
New Metrorail bridge over Pimmit Run	Dulles Connector Road, Pimmit Run Stream Valley Park	Motorists, transit riders	Moderate	Negligible
		Recreational trail users	High	Minimal
Tysons Corner Visual Assessment Unit				
Elevated alignment along Route 123 and Route 7; underground alignment along Route	Route 123, Route 7, intersecting and parallel roadways, adjacent commercial	Motorists, transit riders, office/commercial viewers,	Moderate	Minimal

Physical Changes	Visibility From	Types of Viewers	Viewer Sensitivity[1]	Visual Impact[2]
123 and Route 7; portals on Route 123 and Route 7	and uses along Route 123 and Route 7, distant residences	Residents (distant)	Moderate	Minimal
Tysons East Station: elevated; including traction power substation	Route 123, Scotts Crossing/Colshire Drive; adjacent offices; nearby residences	Motorists, transit riders, office workers	Moderate	Minimal
		Residents	High	Minimal
Tysons Central 123 Station: elevated; including traction power substation	Route 123, Tysons Boulevard, adjacent and nearby commercial uses (malls), Scotts Run Stream Valley Park	Motorists, transit riders, commercial viewers	Moderate	Minimal
Tysons Central 7 Station: underground with aboveground entrance pavilions	Route 7, adjacent commercial uses, adjacent offices	Motorists, transit riders, commercial viewers, office workers	Moderate	Minimal
Tysons West Station: elevated	DIAAH, Dulles Toll Road, Route 7, Westwood Center Drive/Tyco Road adjacent offices, nearby hotels, commercial uses; distant residences; Ash Grove historic site	Motorists, transit riders, office workers, commercial viewers, hotel guests, employees, distant residents, recreational users	Moderate	Minimal
Mid-Corridor Visual Assessment Unit				
LPA alignment in DIAAH (center median), including removal of median landscaping	DIAAH, Dulles Toll Road, crossing roads, plus some adjacent land uses (though mostly screened by soundwalls, landscaping, and topography), Hunter Mill Road Proposed Historic District	Motorists, transit riders, misc. viewers in adjacent land uses	Moderate	Minimal
		Residents	High	Negligible
Wiehle Avenue, Reston Parkway, Herndon/Monroe Metrorail Stations (center median of DIAAH)	DIAAH, Dulles Toll Road, Wiehle Avenue, Reston Parkway, adjacent parking areas, adjacent office buildings, adjacent roadways	Motorists, transit riders, office workers	Moderate	Minimal
Route 28 Station (center median of DIAAH)	DIAAH, Dulles Toll Road, adjacent roadways, adjacent residents	Motorists, transit riders	Moderate	Minimal
		Residents	High	Minimal
Traction Power substations along DIAAH/Dulles Toll Road, including one near the Barns at Wolf Trap	DIAAH, Dulles Toll Road, plus potentially the Barns at Wolf Trap	Motorists, transit riders	Moderate	Minimal
New Metrorail bridge over Difficult Run	DIAAH, Dulles Toll Road, Difficult Run Stream Valley Park	Motorists, transit riders	Moderate	Negligible
		Recreational trail users	Low	Negligible
New Metrorail bridge over W&OD Railroad Regional Park	DIAAH, Dulles Toll Road, W&OD Railroad Regional Park	Motorists, transit riders	Moderate	Minimal
		Recreational trail users	Low	Negligible

Physical Changes	Visibility From	Types of Viewers	Viewer Sensitivity[1]	Visual Impact[2]
Dulles Airport Visual Assessment Unit				
LPA alignment (mostly underground, with portals east and west of the terminal, as well as ventilation and emergency access shafts); alteration of the "peekaboo" sequence	Airport roadways, terminal, parking areas, other airport uses	Motorists, transit riders	Moderate	Minimal
		Airport workers, air travelers	High	Substantial
Dulles Airport Station (underground)	Airport roadways, terminal, parking areas, other airport uses	Motorists, transit riders, airport workers	Moderate	None
		Airport workers, air travelers	High	None
Traction Power Substation	Airport roadways, parking areas, other airport uses	Motorists, transit riders, airport workers	Moderate	Negligible
		Airport workers, air travelers	Moderate	Negligible
Dulles Greenway Visual Assessment Unit				
LPA alignment in Dulles Greenway (center median)	Dulles Greenway, Cultural Resource House in Ryan (53-23)	Motorists and transit riders	Moderate	Negligible
Route 606 Station (adjacent to Dulles Greenway)	Dulles Greenway, Dulles Transit Center	Motorists and transit riders	Moderate	Negligible
Route 772 Station (adjacent to Dulles Greenway)	Dulles Greenway, Cultural Resource House in Ryan (53-23)	Motorists and transit riders	Moderate	Minimal
S&I Yard Site 15	Route 606; Dulles Airport north-south runway; industrial land uses	Motorists. air travelers, airport workers, office/warehouse workers	Moderate	Minimal

1 View sensitivity levels are discussed in Section 3.4.1

2 Substantial visual impacts are those that result in deterioration in the ability to use the adjacent land as intended, a reduction in the quality of that use, obstruction of an important view, interference with a specific design in the environment, degradation of a natural condition, removal of a substantial portion or the last amount of landscaping or the natural vegetation, or similar levels of visual disturbance. Less than substantial impacts are those visual effects that would not result in these conditions. Minimal visual impacts are those that would be barely noticeable to the general public.

3.4.3.1 No Build

No visual effects from the Dulles Corridor Rapid Transit Project would occur under the No Build Alternative. However, there could be effects from improvements assumed under this alternative. Visual effects resulting from improvements assumed under the No Build Alternative would be the responsibility of agencies and jurisdictions implementing the improvements.

3.4.3.2 Wiehle Avenue Extension

The Wiehle Avenue Extension is primarily located within an existing transportation corridor. The Wiehle Avenue Extension would introduce new visual elements, such as Metrorail stations, pedestrian walkways, parking structures, tie-breaker stations and traction power substations, into the existing visual setting of the study area. However, due to the existing land uses and existing visual and aesthetic characteristics of the area, the Wiehle Avenue Extension and associated facilities would have a less than substantial effect on sensitive resources and viewers.

3.4.3.3 Full LPA

The visual effects of the full LPA would be similar to those of the Wiehle Avenue Extension in areas east of, and including, the Wiehle Avenue Station. The LPA is primarily located within an existing transportation corridor. The LPA would introduce new visual elements, such as Metrorail stations, pedestrian walkways, parking structures, tie-breaker stations and traction power substations, into the existing visual setting of the study area. Due to the existing land uses, lack of sensitive viewers, and existing visual and aesthetic characteristics of the area, the full LPA and associated facilities in general would have a less than substantial effect on sensitive resources and viewers. However, the full LPA would have a substantial visual affect on the peekaboo sequence within the Dulles International Airport Historic District.

3.4.4 CONSTRUCTION EFFECTS

The visual effects associated with construction of the LPA would be similar to and include those described in Section 3.4.4 of the Draft EIS for the Metrorail Alternative (T6/Y15). Most construction and mitigation techniques have not been identified at this time, but it is assumed that standard Best Management Practices would be used for construction.

The construction staging areas will be located along the corridor for construction of the LPA. Views into construction staging areas could occur relative to the selected locations, potentially impacting views from highly sensitive viewers. Construction staging areas often contain construction equipment, stockpiles of materials, construction maintenance facilities, refueling stations, employee welfare facilities (including portable toilets), and parking for employee vehicles. This type of land use, though temporary, is generally not visually compatible with most surrounding development or undeveloped land, including the type of development that is most common throughout the Dulles Corridor: office, commercial, residential, recreational, and open space. In many cases, large numbers of viewers would be able to see the construction staging areas, either from high-volume roadways or from tall office and residential buildings. Thus, it is likely that at least some of the construction staging areas would result in substantial short-term visual impacts if not screened from view.

In Tysons Corner, construction of the elevated and underground segments of the LPA would have additional visual effects. Elevated segments take longer to construct and would be more visible and harder to screen from view. Thus, these portions of the LPA have a greater chance of resulting in construction-related visual impacts in Tysons Corner. The density of development in Tysons Corner and the height of many of the buildings allows for large numbers of viewers to see the construction. Underground segments, on the other hand, require special construction techniques and special staging areas. Construction of underground segments creates the need for removal of spoils (wastes) that must be stockpiled or hauled away and could result in visual impacts. Any accumulation of dirt outside the excavation resulting from haul trucks is particularly likely to result in visual impacts.

Underground operations would have construction activity visible only at the entrances and at stations. However, if, cut-and-cover tunnel construction techniques are used, whereby a trench is dug, tunnel lining and support are constructed from aboveground, and then the tunnel is covered, construction activities would be visible from areas surrounding the entire tunnel, not just at the entrances and stations.

3.4.5 MITIGATION

To mitigate any visual effects of the project, DRPT and WMATA would consider designs for Metrorail stations, aerial structures, and portals that are compatible with the surrounding environment. In addition, landscaping would be provided at stations. Using established WMATA designs, traction power substations and tie-breaker stations would be designed to be compatible with the surrounding environment. At Dulles Airport, the design of the two tunnel portals would consider the historic terminal and other contributing elements to the historic district. DRPT and WMATA would coordinate with the Metropolitan Washington Airports Authority and the Virginia Department of Historic Resources in the design of these facilities.

3.5 CULTURAL RESOURCES

This section presents information regarding the impacts to archaeological and historic architectural resources that would occur due to the Wiehle Avenue Extension and the full LPA. The discussion includes a description of regulatory requirements, methods of identifying existing historic properties, the archaeological and architectural resources identified, discussions of impacts, and potential mitigation measures.

3.5.1 LEGAL AND REGULATORY CONTEXT

Section 106 of the National Historic Preservation Act, 16 U.S.C. 470(f), as amended (Section 106), governs federal actions that could affect historic properties. Section 106 requires federal agencies to take into account the effects of their undertakings, including licensing and approvals on historic properties, and to afford the Advisory Council on Historic Preservation (ACHP) and other interested parties a reasonable opportunity to comment on such undertakings. As defined broadly by 36 CFR 800.16, a "historic property" means "any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places (NRHP) maintained by the Secretary of the Interior." This term includes archaeological sites and properties of traditional religious and cultural importance to Native American tribes or Native Hawaiian organizations that meet the NRHP criteria. Section 101(b)(4) of NEPA requires federal agencies to coordinate and plan their actions so as to preserve important historic, cultural, and natural aspects of the country's national heritage.

Properties that qualify for inclusion in the NRHP must meet at least one of the following four criteria:

- Criterion A: Association with events that have made a significant contribution to the broad patterns of our history;
- Criterion B: Association with the lives of persons of significance in our past;
- Criterion C: Embody the distinctive characteristics of a type, period, or method of construction, or the work of a master, or high artistic values, or a significant and distinguishable entity whose components may lack individual distinction; or
- Criterion D: Have yielded, or may be likely to yield, information important in prehistory or history (36 CFR 60.4).

Properties that qualify for the NRHP also must possess integrity, defined by the following seven aspects: location, design, setting, materials, workmanship, feeling, and association. The term "eligible for inclusion in the NRHP" includes both properties formally designated as eligible and all other properties determined to meet NRHP criteria. Normally, NRHP eligibility requires a property to be at least 50 years of age. In

order for buildings and structures less than 50 years of age to be eligible for the NRHP, these resources must be highly significant and meet the "special criteria considerations" as outlined in 36 CFR 60.4.

National Historic Landmarks are defined as historic properties of outstanding national significance that have been specially designated by the Secretary of the Interior, in accordance with 36 CFR 65.

Section 4(f) of U.S. Department of Transportation Act, as amended (49 USC 303 (c)) states that U.S. DOT may not approve the use of land from a publicly owned park, recreation area, wildlife or waterfowl refuge, or historic site of national, state, or local significance, unless a determination is made that there is no feasible and prudent alternative to the use of that land and the action includes all possible planning to minimize harm to the property resulting from such use. Chapter 7 of this Final EIS contains a complete discussion of sites and issues covered by this statute and its regulations.

3.5.2 METHODOLOGY

An integral part of the Section 106 process is to determine the area within which archaeological and historic architectural resources would be affected or are likely to be affected. As defined by 36 CFR 800.16 (d), the Area of Potential Effect (APE) represents the "geographic area or areas within which an undertaking could cause changes in the character or use of historic properties, if any such properties exist." In accordance with 36 CFR 800.4(a), DRPT and WMATA consulted the Virginia Department of Historic Resources (VDHR) in determining the boundaries of the APE.

The APE for archaeology was initially defined as 200 feet beyond the predicted limits of disturbance and 200 feet beyond station footprints to allow for possible variation during construction. In delineating the APE, major human-made and natural features were considered. Survey work determined that portions of the APE had been disturbed by development-related construction and did not require intensive-level survey, and several areas were removed as a result of the selection of the Metrorail Alternative (T6/Y15) as the LPA. The remaining areas, a total of 138.07 acres, constitute the revised APE for archaeology on which the field investigations described in the Project's April 2004 *Identification and Evaluation Report—Archaeology* are based. Figures 3.5-1a and 3.5-1b show the revised APE for archaeology.

During the development of the Draft EIS, the APE for architecture was established at 1,000 feet from the centerline to account for the uncertainty of the proposed design plans for the various alternatives under consideration. The potential for direct, indirect, audible, and/or visual impacts to historic resources was assessed for a wide area to ensure a comprehensive study of all NRHP-listed or -eligible resources that could be affected by the proposed undertaking. Following the selection of the Metrorail Alternative (T6/Y15) as the LPA and subsequent narrowing of the study area, VDHR, DRPT, and WMATA agreed that a 1,000-foot APE was no longer necessary or appropriate. Based on an analysis of the impacts associated with the Wiehle Avenue Extension and the full LPA, the APE for architecture was revised to 600 feet from the centerline. Figures 3.5-1a and 3.5-1b show the revised APE for architecture.

The *Cultural Resources Technical Report (Phase 1a)* was prepared in August 2003 to provide further documentation of the data upon which the Draft EIS cultural resources analysis and Section 4(f) evaluation was based. The information presented in that report partially fulfilled the requirements of Section 106, including documentation of known archaeological and architectural resources that might be affected by the proposed project and identification of areas that may contain archaeological and/or architectural resources.

In order to complete the requirements of identification and evaluation under Section 106, the *Identification and Evaluation Report—Archaeology* and the *Identification and Evaluation Report—Historic Architecture* were prepared in April 2004 to document archaeological and historic architectural resources within the APE that had not previously been recorded and evaluated for NRHP eligibility. A Phase 1b archaeological survey of selected portions of the corridor was undertaken to determine the presence or absence of prehistoric and historic archaeological resources that may be in the APE and to provide recommendations on further cultural resource investigations.

Based on the Phase 1a survey completed in August 2003, 49 areas within the APE were recommended for additional archaeological survey. The total surveyed area was 138.07 acres, and a total of 2,101 shovel tests were excavated. Nine isolated artifact locations were identified; however, no archaeological sites were identified, and no remains of previously identified archaeological sites were found within the APE. Because no historic properties were identified, no additional archaeological studies were recommended.

Based on the August 2003 Phase 1a survey and in coordination with VDHR, DRPT and WMATA identified 83 historic architectural resources within the APE that required Phase 1b survey and documentation. These resources are located in the portion of the corridor between the West Falls Church Metrorail Station and Tysons Corner in Fairfax County. The scope of this phase of work involved the execution of a reconnaissance level survey of each resource in accordance with VDHR survey guidelines. A historic context on the rapid development of Fairfax County during the second and third quarters of the twentieth century was developed in order to evaluate these resources within a relevant context for eligibility of listing in the NRHP. No new potentially eligible resources were identified during this investigation, and no additional architectural studies were recommended.

Together, the August 2003 *Cultural Resources Technical Report (Phase 1a)* and the April 2004 *Identification and Evaluation Reports* for archaeology and historic architecture serve as a detailed record of the cultural resources data collection that was performed during the preliminary engineering and environmental review process, as well as fulfilling the requirements of identification and evaluation under Section 106.

3.5.3 EXISTING CONDITIONS

The following sections describe the process used to identify historic properties, their historic context, and the archaeological and historic architectural resources that were identified.

3.5.3.1 Efforts to Identify Historic Properties

The identification of potentially affected historic properties is a critical step for compliance with both Section 106 and NEPA. Identification was conducted in accordance with the regulations implementing Section 106 and the *Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation* (48 FR 44716-44742), as well as guidance issued by VDHR.

Efforts to identify historic properties included, but were not limited to, public input obtained from public scoping meetings and other public meetings conducted for NEPA and Section 106 compliance, meetings or contact with other interested parties and agencies, including DRPT, WMATA, MWAA, and VDHR, and contact with individuals knowledgeable about known or potentially historic properties. Historic literature and maps were researched, along with historic context information from state and local guidelines and secondary sources.

Figure 3.5-1b

Area of Potential Effect and Known Historic Resources

Dulles Corridor Rapid Transit Project

Key file materials, such as the NRHP and National Historic Landmark nomination forms, files and inventories for locally significant properties housed at VDHR and Fairfax County, and previous investigations (e.g., surveys and compliance-related reports) were reviewed. Shovel-testing of areas determined to have a high likelihood of archaeological potential; and reconnaissance-level survey of architectural resources in the APE were conducted.

Several repositories were consulted to identify known or potential historic properties and develop the historic context for the APE. Repositories visited included but were not limited to: the Library of Congress, VDHR, the Virginia State Library, the Virginia Room of the Fairfax County Library, the Fairfax County Planning Office, Fairfax Archaeological Services, Fairfax County Park Authority (FCPA), the Thomas Balch Library in Leesburg, the Virginia Room of the Spotsylvania County Public Library, the Architecture Library of the University of Maryland in College Park, and the Gelman Library of George Washington University in Washington, D.C.

3.5.3.2 Historic Context

Knowledge of local prehistory and history helps to place cultural resources within their historic context. A summary of prehistoric (Native American prior to European contact) and historic (since European immigration to the Americas) development within Fairfax and Loudoun counties is provided in the Project's April 2004 *Identification and Evaluation Report—Archaeology* and *Identification and Evaluation Report—Historic Architecture*.

3.5.3.3 Archaeological Resources

Archaeological resources are locations with evidence of past human activity. The sites identified below are listed in order from east to west; actual locations of archaeological sites are kept confidential to protect the sites from disturbance and are not provided in this Final EIS. The description begins with the site number assigned by the State Historic Preservation Officer (SHPO), beginning with 44, the code for Virginia (the 44th state in alphabetical order). The next two letters designate the county or city (FX for Fairfax County or LD for Loudoun County). The following number is assigned in sequence as new sites are recorded with the state. In parentheses after the site number is the name given to the site by those who provided the site information to the state.

Based on the selection of the Metrorail Alternative (T6/Y15) as the LPA and subsequent narrowing of the APE, as well as the results of additional testing of previously identified sites during the Phase 1b survey, several archaeological resources discussed in the Draft EIS, and the Supplemental Draft EIS are no longer considered to be affected by the full LPA or the Wiehle Avenue Extension. Previously identified sites that no longer fall within the APE for archaeology include: Site 44FX2662 (Zipf); Site 44FX2024 (Magarity Site); Site 44FX0051 (Maplewood); Site 44FX2299 (Jarrett #4); Site 44FX1569 (Dulles Toll Road Site); Site 44FX2034 (Reston Land Parcel 912 A&B); Site 44FX1489 (Worldgate Hotel Site); Site 44FX0232; Site 44FX2233 (Dulles Green/DG 2); Site 44LD0500 (Trueno); Site 44LD0491 (HE-696A "Orange"); Site 44LD0380 (HNWF-1A); Site 44LD0383 (HSEE-BR); Site 44LD0472 (HE-P620A); Site 44LD0377 (HNWB-1A); Site 44LD0378 (HNWB-1B); and Site 44LD0852 (Shellhorn Road 1). Detailed summaries of these resources can be found in the documents listed above.

Seven previously-identified archaeological sites are located within the revised APE for archaeology and are summarized in Table 3.5-1.

Table 3.5-1: Archaeological Resources Identified

Site	Description	Listing
44FX0388 – Olney Park/Dulles Access Connector	Prehistoric archaeological site; most likely a rock quarry	Eligibility undetermined
44FX2405 – Scott's Run Site	Prehistoric archaeological site; lithic workshop used to process stone tools	Eligibility undetermined
44FX0915 – Arrowhead Farm	Historic archaeological site, early 20th century	Eligibility undetermined
44LD0379 – Indian Creek Site	Prehistoric, early/middle archaic occupation archaeological site	Potentially eligible for listing in the NRHP
44LD0432 – Runway #1	Prehistoric archaeological site	Eligibility undetermined
44LD0406	Prehistoric and historic occupation with artifacts dating to the Early Archaic period archaeological site	Potentially eligible for listing in the NRHP
44LD0408	Prehistoric archaeological site	Not eligible for listing in the NRHP

Source: Identification and Evaluation Report-Archaeology, April 2004.

In addition to these seven previously identified archaeological sites, nine isolated artifact locations were discovered during the Phase 1b archaeological survey conducted in early 2004. However, by definition, none of these meet the minimum requirements for consideration of eligibility for listing in the NRHP. The April 2004 *Identification and Evaluation Report—Archaeology* contains a discussion of these locations, as well as the other survey areas where shovel tests did not result in the identification of archaeological sites or isolated artifact locations.

3.5.3.4 Historic Architectural Resources

Generally, historic architectural resources are buildings, structures, landscapes, or objects greater than 50 years of age. Locations of the known architectural resources within the APE are shown in Figures 3.5-1a and 3.5-1b.

Based on the selection of the Metrorail Alternative (T6/Y15) as the LPA and subsequent narrowing of the APE, as well as the further reduction of the APE to 600 feet prior to Phase 1b survey, several architectural resources discussed in the Draft EIS, and Supplemental Draft EIS are no longer considered to be affected by the LPA or the Wiehle Avenue Extension. Previously identified sites that no longer fall within the revised APE for architecture include: Bois de Gosses (29-81, 1358 Windy Hill Road, McLean); Shiloh Baptist Church (29-189, 1331 Spring Hill Road, McLean); Wiehle/Sunset Hills Proposed Historic District (29-14, Reston); Robert Wiehle House (29-14-1, 1830 Old Reston Avenue, Reston); Smith Bowman Distillery (29-14-2, 1875 Old Reston Avenue, Reston); Sunset Hills (29-14-3, 1850 Reston Avenue, Reston); Ratcliff/Meiselman House (29-245, 2346 Centreville Road, Herndon); Middleton Farm (29-253, 13801 Frying Pan Road, Herndon); Cockerille House (53-1100, Route 789, Sterling vicinity); House, and Route 772 (now Petworth Court) (53-1095, Ryan).

Nine known historic resources are located within the revised APE for architecture. Summaries of these resources can be found in Table 3.5-2. Detailed descriptions of these resources are contained in the Draft EIS and Supplemental Draft EIS.

Table 3.5-2: Historic Architectural Resources Identified

Resource	Description	Listing
The Lewinsville Post Office (29-338), 1554 Great Falls Road, McLean	Architectural resource, dating to the 1850s	Potentially Eligible for listing in the NRHP
Ash Grove (29-2), 8900 Ash Grove Lane, Vienna	Architectural resource, dating to the 1790s	Potentially Eligible for listing in the NRHP
Wolf Trap National Park for the Performing Arts (29-159) 1551 and 1555 Trap Road, Vienna	130-acre complex consisting of historic farm and associated outbuildings developed for the performing arts	Listed on the Fairfax Co. Historic Landmarks Inventory; Potentially eligible for listing in the NRHP
Plantation (29-5180) 1624 Trap Road, Vienna	Architectural resource, dating to 1895	Listed on the Fairfax Co. Historic Landmarks Inventory; Potentially eligible for listing in the NRHP
Hunter Mill Proposed Historic District (29-5180), Reston	District, stretching along Hunter Mill Road from Baron Cameron Road (6oute 606) to Chain Bridge Road (Route 123), with various resources and contributing elements identified along the roadway	Potentially Eligible for listing in the NRHP
Launders House (29-240), 2300 Centreville Road, Herndon	Architectural resource, built around 1910	Potentially Eligible for listing in the NRHP
Washington Dulles International Airport (53-8)	Proposed historic district within the 11,000-acre airport complex with various contributing elements, including the "peekaboo sequence" consisting of a series of viewsheds designed to allow motorists to gradually view structures on the airport property as they approach	Eligible for listing in the NRHP
House, Route 643 (53-23), Ryan	Architectural resource, dating to the late 19th century	Potentially Eligible for listing in the NRHP

Source: Identification and Evaluation Report-Historic Architecture, April 2004.

3.5.4 LONG-TERM EFFECTS

As defined in Section 106 of the National Historic Preservation Act, an effect on a cultural resource could occur due to an action that could 1) physically damage or destroy all or part of the property; 2) isolate the property or alter the character of the property's setting, when that character contributes to the property's qualification for the NRHP; 3) introduce visual, audible, or atmospheric elements that are out of character with the property or alter its setting; 4) result in neglect of a property leading to its deterioration or destruction; or 5) result in the transfer, lease, or sale of the property without adequate restriction or conditions included to ensure preservation of the property's significant historic features.

The long-term effects of the Wiehle Avenue Extension and the LPA on cultural resources could be direct or indirect. Direct effects would result from actual physical contact with the resources, while indirect effects would be from noise and visual impacts. Indirect impacts are more likely to affect historic architectural resources than archaeological sites. Exceptions include archaeological sites that are open to the public for visitation, such as those located at historic house museums or battlefield parks. The noise impacts at the identified historic architectural resources within the APE were assessed in accordance with applicable noise criteria. Potential impacts on historic architectural resources were assessed using FTA and WMATA criteria for noise. Vibration levels at the historic resources were judged to be below FTA criteria for annoyance and well below the threshold for minor cosmetic damage.

Table 3.5-3 summarizes the effects of the Wiehle Avenue Extension and the full LPA archaeological resources, while Table 3.5-4 summarizes the effects of the Wiehle Avenue Extension and the full LPA on historic architectural resources.

Table 3.5-3: Project Effects on Archaeological Resources

Resource	No Build Alternative	Wiehle Avenue Extension	Full LPA
Site 44FX0388 (Olney Park/Dulles Access Connector Site)	Continues current conditions.	No historic properties affected.	No historic properties affected.
Site 44FX2405 (Scott's Run Site)	Continues current conditions.	No historic properties affected.	No historic properties affected.
Site 44FX0915 (Arrowhead Farm)	Continues current conditions.	Continues current conditions.	No historic properties affected.
Site 44LD0379 (HNWE-1A or Indian Creek Site)	Continues current conditions.	Continues current conditions.	No historic properties affected.
Site 44LD0432 (Runway #1)	Continues current conditions.	Continues current conditions.	No historic properties affected.
Site 44LD0406	Continues current conditions.	Continues current conditions.	No historic properties affected.
Site 44LD0408 (HSP-789A)	Continues current conditions.	Continues current conditions.	No historic properties affected.

Table 3.5-4: Project Effects on Architectural Resources

Resource	No Build Alternative	Wiehle Avenue Extension	Full LPA
The Lewinsville Post Office (29-338), 1554 Great Falls Road, McLean	Continues current conditions.	No historic properties affected.	No historic properties affected.
Ash Grove (29-2), 8900 Ash Grove Lane, Vienna	Continues current conditions.	No adverse effect.	No adverse effect.
Wolf Trap National Park for the Performing Arts (29-159), 1551 and 1555 Trap Road, Vienna	Continues current conditions.	No historic properties affected.	No historic properties affected.
Plantation (29-188), 1624 Trap Road, Vienna	Continues current conditions.	No adverse effects	No adverse effects
Hunter Mill Road Proposed Historic District (29-5180), Reston	Continues current conditions.	No adverse effect.	No adverse effect.
Launders House (29-240), 2300 Centreville Road, Herndon	Continues current conditions.	Continues current conditions.	No historic properties affected.
Washington Dulles International Airport (53-8)	Continues current conditions.	Continues current conditions.	Adverse effect.
House, Route 643 (53-23), Ryan	Continues current conditions.	Continues current conditions.	No adverse effect.

3.5.4.1 No Build Alternative

The No Build Alternative would continue current conditions and would have no adverse effects on known archaeological or architectural resources in the corridor.

3.5.4.2 Wiehle Avenue Extension

The Wiehle Avenue Extension would have no adverse effects on known archaeological resources in the corridor. There are two previously identified sites (44FX0388 and 44FX2405) located within the Wiehle Avenue Extension portion of the APE; however, no remains of these sites were found within the APE during the 2004 Phase 1b survey. Therefore these sites would not be affected by the Wiehle Avenue Extension. Although Site 44FX0388 was described in the Draft EIS as being potentially disturbed by the

construction of a nearby tie-breaker station, design refinements associated with the relocation of this tie-breaker station have eliminated this potential adverse effect.

The Wiehle Avenue Extension would result in minor impacts to three historic architectural resources: Ash Grove Historic Site, the Plantation, and the Hunter Mill Road Proposed Historic District. However, construction of the Wiehle Avenue Extension would not affect the characteristics that contribute to these resources' eligibility for the NRHP; therefore, no adverse effects would occur.

The **Ash Grove Historic Site** and **the Plantation** would experience a minor increase in noise as a result of Metrorail operations; however, predicted noise levels do not exceed FTA or WMATA criteria at either property. Therefore, this would not adversely affect these resources.

The **Hunter Mill Road Proposed Historic District** could experience minor visual impacts from the Wiehle Avenue Extension. The LPA would pass through the potential historic district in the median of the DIAAH /Dulles Toll Road. In addition, three stormwater management ponds and two traction power substations would be located along the DIAAH/Dulles Toll Road within the potential boundaries of the Project facilities district. These Project facilities have been sited to lessen their visibility by being placed adjacent to the DIAAH/Dulles Toll Road (within or adjacent to existing public right-of-way) and are not near any significant contributing elements of the potential district. Due to the existing conditions, Metrorail operations would not be a predominant source of noise in the area and would not change the overall noise levels in the proposed district. Implementation of the Wiehle Avenue Extension would not have an adverse effect on the characteristics that make the Hunter Mill Road Proposed Historic District significant. Because the proposed district boundaries have yet to be determined, it is possible that these ancillary facilities would be located outside of the proposed district.

3.5.4.3 Full LPA

In addition to the effects on cultural resources discussed for the Wiehle Avenue Extension, the full LPA would also have the additional following effects.

The LPA would have no adverse effects on known archaeological resources in the corridor. There are five previously identified sites located within the APE for the full LPA; however, no remains of these sites were found within the APE during the 2004 Phase 1b survey. Therefore, these sites would not be affected by the LPA.

The LPA would result in an adverse effect on the Dulles International Airport Historic District and minor impacts to the house at 22017 Shellhorn Road (Route 643) in Ryan (53-23). Based on the results of the consultation with VDHR, the impacts to the "peekaboo" views of the main terminal control tower from the DIAAH, a contributing element to the **Dulles International Airport Historic District**, would constitute an Adverse Effect under Section 106. (This was previously identified in the Supplemental DEIS as No Adverse Effect). However, the implementation of the mitigation measures stipulated in a Memorandum of Agreement (MOA) executed between FTA, VDHR, and DRPT would reduce this effect significantly enough that it would no longer be considered adverse. A discussion of the mitigation measures included in the MOA is provided in Section 3.5.6.

In his design for the airport, architect Eero Saarinen incorporated all aspects of airport operations, including the terminal, runways, passenger movement devices called "mobile lounges," airport services and support systems, landscaping, land use, and roadways. It also provided for the DIAAH, a dedicated access road to provide an efficient and direct route to the airport from Washington, D.C. A 1989 historic

architectural survey of the airport property identified 13 of the approximate 62 buildings at the airport as contributing buildings to a historic district associated with the Main Terminal, as well as the 18 original mobile lounges, terminal area landscaping, and the DIAAH.

Also identified as a contributing element to the district was the "peekaboo sequence," a series of viewsheds designed by Saarinen to allow motorists to gradually view structures on the airport property. Saarinen intended that this peekaboo sequence heighten viewer interest by providing motorists approaching the airport along the DIAAH a variety of views of the Main Terminal and control tower from different points along the roadway, each revealing an increasingly greater glimpse of the structures and creating a sense of dramatic expectation. Although several of the peekaboo views have been compromised or eliminated since Saarinen implemented his original design in the 1960s—a result of commercial construction, changes to the Route 28 interchange, and growth of landscaping and vegetation at the perimeter of the airport property and within the Route 28 interchange—the views that exist today remain important elements of the Dulles International Airport Historic District.

The full LPA would approach Dulles Airport at grade in the median of the DIAAH above ground before transitioning to a subway west of the Route 28 interchange after Horsepen Run. Three remaining peekaboo views that provide approaching motorists views of the airport's control tower are located in this area. In response to concerns raised during the Draft EIS comment period, the vertical profile of the Metrorail alignment and the concrete safety barrier required to separate the Metrorail tracks from vehicular traffic on the DIAAH were lowered by 3 feet to minimize the visual impacts of the full LPA on these three peekaboo views. Although these efforts have reduced the potential impacts, the design changes do not alter the full LPA's location within the boundaries of the historic district, and security fencing atop the concrete median barriers would still be required. As a result, the three peekaboo views could still be affected by the full LPA because a new physical element would be introduced between the approaching motorists' views of the control tower as they near the airport proper. Therefore, the visual effect of the portion of the LPA in this area would constitute an adverse effect to the Dulles International Airport Historic District.

With the exception of these three peekaboo views, the full LPA would not result in any additional adverse effects on any other elements of the Dulles International Airport Historic District. A full analysis of the effect of the full LPA on the district can be found in the April 2004 *Identification and Evaluation—Historic Architecture*.

The Route 772 station would be slightly visible from the **house located at 22017 Shellhorn Road (Route 643) in Ryan (53-23)**. Since the publication of the Draft EIS, the Route 772 station footprint has been reconfigured to be consistent with proposed development in the vicinity of the station site. Although the footprint of the proposed station facilities has been decreased and relocated closer to the Dulles Greenway, the station would still have some visual impact on the house, and the impact of the full LPA on this resource was changed from "No Historic Properties Affected" in the Draft EIS to "No Adverse Effect" in the Supplemental Draft EIS. However, the house is presently abandoned and deteriorating, and the property has been compromised by the construction of commercial warehouses immediately east of the farm and the earlier construction of the Dulles Greenway to the south and west. In addition, the approved Loudoun Station development would add new commercial development between the house and the station facilities. This site would experience an increase in noise; however, predicted noise levels do not exceed FTA or WMATA criteria at this property. Therefore, this resource would not be adversely affected by the full LPA.

3.5.5 CONSTRUCTION EFFECTS

Construction effects on cultural resources result when there is direct physical impact. Construction effects could also occur from the operation of heavy equipment on or near a resource. Construction noise and vibration impacts were analyzed and were judged to be below the FTA impact criteria for structural damage along the project corridor (see Sections 4.7 and Section 4.8).

3.5.5.1 No Build Alternative

The No Build Alternative would continue current conditions and would have no construction effects on known archaeological or architectural resources in the corridor associated with this project.

3.5.5.2 Wiehle Avenue Extension

Construction activities associated with the Wiehle Avenue Extension would not result in additional impacts to any known archaeological or historic architectural resources. Several potential construction staging areas would be located along the corridor; however, these staging areas have been sited to avoid all known archaeological and architectural resources. Noise from construction would not change overall noise levels in the corridor in such a way as to result in an adverse effect on any architectural resource.

3.5.5.3 Full LPA

Construction activities associated with the full LPA would not result in additional impacts to any known archaeological resources. Several potential construction staging areas would be located along the corridor; however, these staging areas have been sited to avoid all known archaeological resources.

With the exception of Dulles Airport, no construction effects on historic architectural resources discussed would be anticipated from construction activities related to the full LPA. Noise from construction would not change overall noise levels in the corridor in such a way as to result in an adverse effect on any architectural resource.

During the construction period, there would be short-term impacts to the Dulles Airport terminal. No vibration effects would occur that would exceed FTA criteria. During a portion of the construction period, the area directly over the Dulles Airport underground station, directly in front of the terminal, would be excavated from the surface to allow construction of the station itself. The tunnels leading to and from the Dulles Airport Station also would be excavated from the surface, and then covered within the Dulles International Airport Historic District. During this time, proximity impacts, including air quality, noise, and visual effects, would occur. None of the proximity impacts would have any long-term effects that would compromise the significance of the resource.

3.5.6 MITIGATION

To mitigate the effects of the full LPA on the cultural resources present at Dulles Airport, the at-grade Metrorail alignment in the DIAAH median has been lowered to preserve the historic “peekaboo” view sequence of the control tower and main terminal. In addition, the design of the Dulles Airport station, two tunnel portals, and aerial structures would consider the historic terminal and other contributing elements of the historic district. DRPT and WMATA would coordinate the design of these facilities with the MWAA and the VDHR. As further mitigation, DRPT would also implement treatment measures, such as interpretive exhibits, public artwork, photo documentation, or landscaping to provide Metrorail users and airport travelers with an appreciation for the airport’s unique historic characteristics. A treatment plan incorporating these measures will be developed in accordance with the Section 106 Memorandum of

Agreement (see Appendix F). Additionally, the Section 106 MOA discusses mitigation for discovery of unknown archaeological artifacts.

3.6 PARKLANDS AND RECREATION AREAS

This section describes existing public parklands and recreation areas located within the study area of the project. An assessment of the long-term operating and short-term construction effects of the No Build Alternative, the Wiehle Avenue Extension and the full LPA on these resources, and proposed measures to mitigate any potential adverse impacts on parklands, is provided in the following sections. Additional details are presented in the Section 4(f) Evaluation and 6(f) Evaluation included in Chapter 7.

3.6.1 LEGAL AND REGULATORY CONTEXT

Section 4(f) of the U.S. Department of Transportation Act of 1966 protects public parks and recreational lands, wildlife habitat, and historic sites of national, state, or local significance from acquisition and conversion to transportation use. Section 4(f) is implemented by regulations 23 CFR 771.135. The Section 4(f) Evaluation in Chapter 7 provides detailed information on the conditions of "use" under Section 4(f).

Section 6(f) of the U.S. Land and Water Conservation Fund Act of 1965 (16 U.S.C. 4601-4 to 4601-11) preserves, develops, and assures the quality and quantity of outdoor recreation resources through purchase and improvement of recreational lands, wildlife and waterfowl refuges, and other similar resources. Certain conditions must be met before conversion of these resources to other usage.

Federal Transit Law 49 USC §5301(e) requires that special effort should be made to preserve the natural beauty of the countryside, public park and recreation lands, wildlife and waterfowl refuges, and important historical and cultural assets when planning, designing, and carrying out an urban mass transportation capital project with Federal financial assistance under sections 5309 and 5310 of this title.

3.6.2 METHODOLOGY

Potential effects to publicly owned or leased parks and recreation lands (parks) that are located within the proposed limit of disturbance for the various alternatives or immediately adjacent to these areas are described in this section. The study area for parklands and recreation areas was initially defined as an area within 300 feet of the proposed alignments, station areas, S&I Yard, and maintenance and storage facility. After the noise, vibration, and air quality effects (discussed in Chapter 4) were carefully analyzed, this study area was reviewed to ensure it adequately covered all of the parklands and recreational areas potentially affected. Section 3.2 contains information on neighborhood parks and community facilities that are not within or immediately adjacent to the limits of disturbance for any of the alternatives, and are not publicly owned.

Parklands and recreation areas in the study area were identified in coordination with the Fairfax County Park Authority (FCPA), Fairfax County Planning Department, Loudoun County Planning Department, Northern Virginia Regional Park Authority (NVRPA), the National Park Service (NPS), and the Commonwealth of Virginia Department of Conservation and Recreation (DCR). Parkland boundaries were confirmed with reviews of park master plans, the Outdoors 2002, Virginia ADC maps, aerial

photography, comprehensive plans, and information found on websites of the FCPA, NPS, NVRPA, and Hunter Mill Defense League.

3.6.3 EXISTING CONDITIONS

There are no publicly owned or officially designated wildlife or waterfowl refuges in the vicinity of the study area.

Public parklands and recreation areas within the study area are shown on Figures 3.6-1a and 3.6-1b. The size, ownership, and recreational features for each park identified are summarized in Table 3.6-1. Five agencies have jurisdiction and ownership of parkland resources: NPS, NVRPA, FCPA, Fairfax County School Board, and City of Falls Church School District.

Table 3.6-1: Parklands and Recreation Areas

Park Name	Ownership	Acres	Park Features and Description
Existing Resources			
George Mason High School Athletic Fields 7124 Leesburg Pike	City of Falls Church	17	Athletic fields used by both the school and the City of Falls Church Parks and Recreation Department for organized recreation, including soccer, softball, and baseball.
Mount Royal Park 7141 Idylwood Road	Fairfax County Park Authority	3	Currently a passive park with an open recreation area, but planned improvements to convert this to an active park include the addition of a picnic area, tot lot, play area, tennis courts, and an exercise area.
Pimmit Run Stream Valley Park Great Falls Street/Lemon Road	Fairfax County Park Authority	67.92	Linear passive park located on either side of the Dulles Connector Road and consisting of an informal hiking trail and natural area. The informal hiking trail crosses under the Connector Road, though the land under the existing highway bridges is not part of the park and is not owned by FCPA.
Olney Park 1840 Olney Road	Fairfax County Park Authority	18.02	Neighborhood park with two baseball fields, one basketball court, tennis courts, hiking trail, natural area, open area, picnic area, playground, tot lot, restroom facilities, and a parking lot.
Westgate Park 7508 Magarity Road	Fairfax County Park Authority	12.5	Active park with two baseball fields, two lighted tennis courts, a picnic area, and an open area.
Scotts Run Stream Valley Park Chain Bridge Rd/Magarity Road	Fairfax County Park Authority	23.62	Linear passive park with a trail.
Ash Grove Historic Site Leesburg Pike/Dulles Toll Road	Fairfax County Park Authority	12.3	Active park consisting of a historic house, detached brick kitchen, and wood-framed smokehouse. The Ash Grove Historic Site was dedicated to FCPA by the developer of the Tysons Village townhouses.
Wolf Trap National Park for the Performing Arts 1551 Trap Road	National Park Service	130	Picnic area, restrooms, open area
Meadowlark Gardens Regional Park 9750 Meadowlark Gardens Court	Northern Virginia Regional Park Authority	95	Active park with gardens, meeting and reception rooms, gazebos, trails, and a gift shop.

Park Name	Ownership	Acres	Park Features and Description
Difficult Run Stream Valley Park Browns Mill Rd/ Beulah Road	Fairfax County Park Authority	863.33	Passive park with a hiking and equestrian trail that extends into the Wolf Trap Meadow subdivision. The trail crosses under the DIAAH and Dulles Toll Road, though the land under the existing highway bridges is not part of the park and is not owned by FCPA. Construction of a natural surface trail, as part of the Fairfax Cross-Country Trail, is planned for 2004.
Washington & Old Dominion Railroad Regional Park 21293 Smiths Switch Road	Northern Virginia Regional Park Authority	45 miles long and 100 feet wide	A 45-mile long, 100-foot wide recreational trail extending from Arlington County to Loudoun County. The park consists of a paved trail for walking, running, and bicycling, as well as a 32-mile adjacent gravel equestrian trail.
Hutchison Elementary School Athletic Fields 13209 Parcher Avenue	Fairfax County School Board	34.8	Active park with two baseball fields and six football fields. Through an agreement with Fairfax County Public Schools, the FCPA uses the school's athletic fields after hours.
Soccer Fields	Fairfax County Board of Supervisors	3.76	Interim use soccer fields, part of a developer proffer to develop land at a later date as a transportation facility.

3.6.4 LONG-TERM EFFECTS

This section discusses the long-term (2025) effects to parklands that would result from the No Build Alternative, the Wiehle Avenue Extension and the full LPA. Table 3.6-2 summarizes the long-term effects to parklands. There would be no long-term effects to officially designated wildlife or waterfowl refuges as a result of the No Build, the Wiehle Avenue Extension or the full LPA because these resources do not exist within the study area.

Table 3.6-2: Summary of Long-Term Effects on Parklands

Park Name	No Build Alternative (2025)	Locally Preferred Alternative		
		Wiehle Avenue Extension Opening Year (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
George Mason High School Athletic Fields 7124 Leesburg Pike	No Effect	No Effect	No Effect	No Effect
Mount Royal Park 7141 Idylwood Road	No Effect	No Effect	No Effect	No Effect
Pimmit Run Stream Valley Park Great Falls Street/Lemon Road	No Effect	No Effect	No Effect	No Effect
Olney Park 1840 Olney Road	No Effect	No Effect	No Effect	No Effect
Westgate Park 7508 Magarity Road	No Effect	No Effect	No Effect	No Effect

Soccer Fields* Land Bay 5 at Dulles Greens	No Effect	No Effect	No Effect	Converts to Transportation Use

*Land for fields was dedicated to Fairfax County for station facilities associated with the project. Soccer fields are temporary use only.

3.6.4.1 No Build Alternative

There would be no long-term effects on parklands associated with the No Build Alternative.

3.6.4.2 Wiehle Avenue Extension

The Wiehle Avenue Extension would not adversely affect any of the park resources identified between the end of the Metrorail Orange Line and Wiehle Avenue. The alignment would span three parks, Pimmit

Run Stream Valley Park, Difficult Run Stream Valley Park and the W&OD Regional Railroad Trail. These parks would not experience long-term impacts as a result of the Wiehle Avenue Extension due to the existing conditions at these crossings and the fact that planned bridge structures related to these crossings would not be located within park property.

The Draft EIS and Supplemental Draft EIS documented that there would be an adverse effect on the crossing at the W&OD Regional Railroad Trail. Subsequent to these documents, DRPT received confirmation from NVRPA in February 2004, that there would be no impact to the trail and that the planned crossing would adhere to NVRPA design guidelines.

Two resources, Scotts Run Stream Valley Park and the Ash Grove Historic Site would experience minor proximity impacts.

Scotts Run Stream Valley Park is located adjacent to Route 123, a major thoroughfare within Fairfax County. The surrounding area consists of suburban development, with various multiple-floor commercial office buildings, apartments and transportation facilities currently within view of this resource. Route 123 has recently been widened from four to eight lanes and its crossing of the park was expanded. In addition, a new multiple-floor office building has been constructed along the eastern side of Scotts Run Stream Valley Park. The Tysons East Station would be located adjacent to the park, where the park abuts Route 123. The station would have a minimal effect on the visual character of the surrounding area and park. Due to the existing conditions of the area, the visual effects resulting from the Wiehle Avenue Extension would not result in a substantial impairment of the use or function of this park.

Ash Grove Historic Site is located adjacent to the DIAAH/Dulles Toll Road and a residential complex. Ash Grove would experience a minor increase in noise as a result of the implementation of the Wiehle Avenue Extension. Based on the existing conditions at the site, the Wiehle Avenue Extension operations would not substantially impair the use or function of this resource.

In addition to the existing resources identified, Fairfax County has developed a *Countywide Trails Plan* that identifies areas that could become trails. Currently, there are no formally designated easements for these proposed trails. Several of the trails identified in the Plan are within the study area.

The new Metrorail bridge structure over Hunter Mill Road, a designated Virginia Scenic Byway, and proposed stormwater management ponds, and the Tysons East Station are within proximity to proposed trails.

During engineering and design, coordination with Fairfax County would continue to avoid and/or minimize impacts to these proposed facilities. It is likely that these trails, if officially designated during the final design and engineering, could be incorporated into the design of the Wiehle Avenue Extension, thereby enhancing accessibility to these trails.

3.6.4.3 Full LPA

With the exception of the interim use soccer fields at Dulles Greens, the long-term effects related to implementation of the full LPA would be the same as discussed for the Wiehle Avenue Extension. The soccer fields are a temporary special use of this land. The land for these soccer fields was dedicated to Fairfax County in a proffer for station facilities associated with the project in the future. Additional information on the terms of the proffer is provided in Appendix I. There would be no other additional impacts to park resources as a result of the full LPA.

According to Fairfax County's *Countywide Trails Plan*, as described above, several trails identified in the Plan are within the study area. The following project-related actions are within proximity to these proposed trails:

- Reston Parkway Station
- Herndon-Monroe Station
- Route 28 Station

During engineering and design, coordination with Fairfax County would continue to avoid and/or minimize impacts to these proposed facilities. It is likely that these trails, if officially designated during the final design and engineering, could be incorporated into the design of full LPA, thereby enhancing accessibility to these trails.

3.6.5 CONSTRUCTION EFFECTS

3.6.5.1 No Build

No construction effects would occur from the No Build Alternative.

3.6.5.2 Wiehle Avenue Extension

Temporary construction effects would likely occur to Pimmit Run, Scotts Run Stream Valley Park, Difficult Run Stream Valley Park and the W&OD Railroad Regional Park. Construction activities would be scheduled so that disruption to the use of these facilities would be minimized. Signage and temporary access around construction activities would be provided so that access to these parklands would be maintained. It is not anticipated that construction activities would impair the use of these park resources.

Temporary, non-adverse construction-related noise, increased air borne particulate matter, visual and stream water quality impacts would occur. Sections 3.6 - Visual and Aesthetics, 4.2 - Water Resources, 4.6 - Air Quality and 4.7 – Noise provide a more in-depth description of the temporary construction effects related to these topic areas. Standard Best Management Practices would be employed to avoid and/or minimize construction related impacts. It is assumed that after construction activities are complete, pre-construction conditions would be reestablished.

A contractor work area would be located in the vicinity of the Ash Grove Historic Site. The work area would be located within the interchange of Route 7 and the DIAAH/Dulles Toll Road. Temporary non-adverse effects, such as increased noise and air borne particulate matter, may result. Best management practices would be used to avoid and minimize these impacts to the extent possible. Upon completion of the alignment, it is assumed that current conditions would resume.

3.6.5.3 Full LPA

Aside from the impacts discussed for the Wiehle Avenue Extension, there would be no construction-related effects to existing park resources within project limits west of Wiehle Avenue.

3.6.6 MITIGATION

DRPT would design and construct the Metrorail overpass of the W&OD Railroad Regional Park in accordance with the NVRPA Guideline for the Development of W&OD Trail Bridge Crossings.

During construction, use of and access to the W&OD Railroad Regional Park would be maintained using measures that may include signage and temporary access around construction activities. Disruption to Pimmit Run Stream Valley Park, Scotts Run Stream Valley Park, and Difficult Run Stream Valley Park during construction would be minimized to extent possible. DRPT would continue to coordinate with NVRPA and FCPA in mitigating any construction impacts of the project upon parklands in the corridor.

3.7 SAFETY AND SECURITY

This section describes safety and security issues in the existing Metrorail and Metrobus system, and those associated with the proposed LPA.

3.7.1 LEGAL AND REGULATORY CONTEXT

WMATA employees and contractors follow the safety requirements and guidelines established by federal and state Occupational Safety and Health Administrations (OSHA) and facilities are designed and constructed to meet the Americans with Disabilities Act Accessibility Guidelines (ADAAG). In addition, the applicable guidelines as issued by other appropriate federal, state and local transportation, fire and safety agencies are applied to WMATA facilities. WMATA has also developed its own safety procedures for construction and operations of its facilities.

WMATA passenger facilities are designed in accordance with the guidelines established in National Fire Protection Association (NFPA) 130, Standards for Fixed Guideway Transit and Passenger Rail systems. NFPA 130, an industry standard, has been developed to ensure maximum passenger safety during emergency situations such as fire events. The guidelines presented in Executive Order 13045, Protection of Children from Environmental Risks, were developed to reduce the safety risks to children. WMATA facilities incorporate the applicable EO 13045 guidelines in the design and construction of the transit facilities.

Due to the proximity of the proposed transit facilities to an air terminal and other air passenger facilities on the grounds of the Dulles Airport, security discussions were initiated with the Transportation Security Agency (TSA), an agency within the Department of Homeland Security. The result of the discussions was that TSA has requested that the Agency be considered a stakeholder on the project and actively participate in developing security measures for the transit facilities located at the airport.

3.7.2 METHODOLOGY

Safety and security issues were determined by identifying the respective concerns as they applied to the construction, operation, and maintenance of the project. These concerns were developed, in part, with reference to industry standards and government regulations. Once identified, they were compared to existing WMATA practices and procedures. If the existing practices and procedures adequately covered the safety and security concern, no impact was deemed to occur. The physical study area for safety and security was the limit of disturbance for the proposed improvements.

3.7.3 EXISTING CONDITIONS

This section discusses WMATA's current safety and security measures for both patrons and employees. Safety refers to providing safe conditions for passengers, employees, and pedestrians within the

Metrobus and Metrorail systems. Security refers to the enforcement of laws and protection measures for passengers, employees, and pedestrians within the Metrobus and Metrorail systems. Safety and security procedures related to construction activities are discussed in Section 3.7.5.

3.7.3.1 Safety

Existing WMATA procedures and adherence to applicable federal, state, and local regulations and industry standards ensure that safety and security concerns related to a patron's access to stations and the use of the Metrobus and Metrorail systems' facilities including stations, parking areas, trains, and buses, are adequately addressed.

A. Stations and Facilities

Metrorail stations and facilities are designed to provide open and unobstructed lines-of-sight. Stations are well-lit and equipped with call boxes, staffed kiosks, and public-address systems. All facilities are designed in accordance with ADAAG Guidelines. Escalators are well signed and emergency stop features are easily accessible. Stairwells and elevators are clearly signed. Station manager kiosks are located adjacent to the fare collection array. Many stations and parking facilities on the Metrorail system are monitored by closed-circuit television (CCTV). In addition, WMATA assigns operating and police personnel to control passenger traffic and monitor the platforms during peak periods at selected stations.

Additional safety features include safety zones under the platform to allow passengers who fall into the train way to avoid the train, hotlines from central control to police and fire departments, automated smoke exhaust systems in tunnels, call boxes, passenger information displays on platforms, and cellular phone service.

B. Trains

Each Metrorail train car contains safety features designed to maintain a safe passenger and employee environment. Passenger-activated safety measures include intercoms to the train operator, fire extinguishers, and emergency exit doors.

Operator-activated safety features include driver operation of doors, two-way radio contact between train operator to central control, and on-board public address system to passengers.

C. Buses

WMATA operates a variety of buses in its fleet, including commuter buses, low-floor transit buses, and articulated buses. Safety features onboard buses include emergency escape windows, manual door releases, ceiling escape hatches, fire extinguishers, two-way radio communication between operators and central control, and emergency silent alarms.

D. Pedestrian/Motorist Safety

The process of station planning and design includes efforts to eliminate or at least minimize potential pedestrian and motor vehicle conflicts. However, on station sites with severe physical constraints, primarily situations where pedestrians must cross access roads or bus ways to reach the station or parking facilities, WMATA relies heavily on roadway and pedestrian signing and well-marked cross walks.

E. Operational Safety Measures

Operational safety measures employed by WMATA include: staff training in emergency response and rescue, including what to do in the event a harmful chemical agent is released; many stations are equipped with bomb containing trash receptacles and the technology to sense the presence of chemicals;

increased frequency of station patrols by special response teams and police officers; increased public address announcements to customers and reinforced security and safety procedures; and use of vehicles furnished with fire-retardant materials, mechanical door releases and auxiliary battery back up to open train doors in the event of a power outage.

3.7.3.2 Security

Mass transit operations can become an attractive target for terrorist or criminal acts or become a victim of collateral damage caused by terrorist acts. The result can be confusion, panic and disorganization on the part of transit patrons, employees and officials as well as the general population. As such, ensuring the safety and security of resources and people has become an increasingly important goal of WMATA and the FTA. To assist in accomplishing the goal, the FTA has developed a security initiative to improve security on transit systems nationwide. The initiative includes: in-depth security assessments, development of plans to address deficiencies, testing the plans in realistic situations, training employees to understand and implement the plan, and undertaking research to enhance human capabilities.

A. Law Enforcement

WMATA has a law enforcement department with more than 357 sworn police officers. Metro Transit Police Department (MTPD) officers provide a variety of law enforcement and public safety services on the Metrobus and Metrorail systems and have arrest powers and jurisdiction for crimes on or against WMATA facilities throughout the 1,500-square mile Transit Zone that includes Maryland, Virginia, and the District of Columbia. Crime in the Metrobus and Metrorail systems varies by location, with most crime occurring in parking lots of the outlying areas of the system. Table 3.7-1 lists numbers of crimes from 1999-2003 by location on the system. Crimes include arson, assault, larceny, motor vehicle theft, attempted motor vehicle theft, homicide, and robbery.

Table 3.7-1: Numbers of Crimes

Location	1999	2000	2001	2002	2003
Bus	69	52	76	75	12
Rail	232	333	313	400	38
Parking Lots	666	686	1,123	986	88

B. Metrorail System and Facilities

In addition to the previously described FTA initiative and WMATA's existing safety measures and procedures, WMATA has implemented and/or proposed additional measures aimed at improving the safety and security on the Metrobus and Metrorail systems before and after the occurrence of any incident. Such an occurrence may include a terrorist or criminal threat or action against federal, MWAA, or WMATA facilities, patrons, or employees. These measures include: chemical sensors at underground Metrorail stations, installation of cameras on additional buses, installation of videotaping capability for the 1,400 security cameras in stations, upgraded public address system at Metrorail stations, the removal of trash bins from station platforms, the addition of bomb containment trash bins on the mezzanine levels of stations, use of explosive ordinance detection equipment, the transfer of newspaper vending machines to locations outside the stations, increased announcements reminding patrons of safety, expanded intrusion detection system at WMATA facilities, the installation of identification card access at sensitive field locations, increased surveillance at bus divisions and rail yards, back-up operations control center, biological sensors pilot program, decontamination pilot program, construction of a mock tunnel for employee training and drills, and regularly scheduled training drills and exercises designed to simulate terrorist, criminal, and accidental actions.

C. Dulles Airport

Because airport security continues to be a sensitive topic, FAA, Transportation Security Administration (TSA), and MWAA keep most safety or security procedures or measures not relating directly to passenger service confidential. MWAA's security features include all required national security requirements directed by TSA, such as increased passenger screening and increased vehicle searches and other measures implemented in association with the Department of Homeland Security's terror code system.

A variety of Metrorail facilities are expected to be located on Dulles Airport property as part of the proposed full LPA, including: alignments that are both aerial and underground, two portals for trains to enter and exit a tunnel, vent and emergency access shafts, traction power substations, and a rail car service and inspection yard (S&I Yard).

Security during construction of these facilities would be based on MWAA requirements and applicable security clearances would be required for all personnel involved in the construction of project facilities. Permanent security would be based on WMATA's policies at the time operations begin plus any additional TSA and MWAA requirements. Portals, vent shafts, and emergency access shafts would be located outside of the airport secure zone and would be equipped with intruder detection systems. The S&I Yard would be isolated from the airfield operations using standard MWAA fencing equipped with an intruder detection system. WMATA's standard security provisions for their other yards and shops will also be integrated into the S&I Yard at Dulles Airport subject to approval of FAA, TSA and MWAA.

Because multiple police forces would be involved in the security of the Metrorail facilities at Dulles Airport, mutual aid agreements would be developed to ensure that no gaps, inconsistencies, or conflicts in security coverage arise. Coordination with FAA, TSA, and MWAA regarding security issues is described below.

D. Agency Coordination

In its comments on the Draft EIS, the FAA expressed concerns regarding the Metrorail facilities to be located on Dulles Airport property and indicated that the TSA would need to review and approve the project's plans and procedures. Coordination meetings to discuss the project and related security issues were held with TSA and MWAA on March 11, 2003 and April 24, 2003. In these meetings, it was agreed by all parties that many of the security issues for the Metrorail extension and the facilities planned at Dulles Airport in particular would be worked out in the later phases of the project (e.g., during preliminary engineering and final design) after the environmental process is complete. The TSA indicated that it has not yet developed specific policies, criteria, or requirements to address rail transit facilities on airport property. TSA expressed its interest as a stakeholder in continued involvement related to security concerns and noted that security measures were constantly changing and improving.

Coordination will continue throughout the remainder of the preliminary engineering and final design stages of the project to develop and/or update the Master Agreements, Mutual Aid Agreements or Memoranda of Understanding regarding security for the Metrorail extension with the jurisdictions affected (e.g., Fairfax County, Town of Herndon, MWAA, and Loudoun County).

3.7.4 LONG-TERM EFFECTS

The long-term effects of the No Build Alternative and the LPA on safety and security are described in the following sections.

3.7.4.1 No Build Alternative

Under the No Build Alternative, there would be no safety and security related effects from the Dulles Corridor Rapid Transit Project. However, there could be effects from the improvements assumed under this alternative. Identification of these effects would be the responsibility of the agencies and jurisdictions responsible for implementing the improvements.

3.7.4.2 Wiehle Avenue Extension

For the Wiehle Avenue Extension, safety and security effects would be similar to those described below for the proposed LPA east of and including the Wiehle Avenue Station. Safety and security effects at premium bus facilities would be similar to those described below for the LPA west of the Wiehle Avenue Station.

If the LPA were not constructed in its entirety by 2025, then safety and security effects west of Wiehle Avenue would be similar to the No Build Alternative.

3.7.4.3 Full LPA

The full LPA can be expected to experience safety and security concerns similar to the current Metrorail system. These concerns include; fire, derailment, loss of power, flooding, hazardous materials incidents, criminal acts, extreme weather, or medical emergencies. Further, there would be a need to account for additional security issues relating to project work and operations at or near Dulles Airport. The issues and solution affecting the Metrorail system in proximity to an airport would be similar to those already in place or being resolved by WMATA for Ronald Reagan Washington National Airport.

A. Metrorail Stations and Facilities

The safety and security concerns at stations include threats of personal crime, car theft, fire, and terrorism. New Metrorail stations, including designated parking, Kiss & Ride, and pedestrian areas, would be constructed with the same or current evolution of safety features as at existing Metrorail stations. Transit areas would be signed and lighted for directing pedestrians and motorists to appropriate and safe areas. No additional adverse effects to pedestrians or motorists are anticipated since pedestrian bridges over existing roadways would be provided at most stations and improvements to crossings would be provided to intersections adjacent to stations. For the project's underground line and station at Dulles Airport, there are no emergency access shafts, exhaust vent shafts or other openings of the project in the airport airside secure zone. Rather, these have been located outside the security fence in a parking lot of general aviation or in a DIAAH interchange.

The new Metrorail stations would be underground, aerial, and at ground level. Station heights could affect emergency response and fire evacuation. The maximum height of the evacuation walkway level of each of the aerial stations would be approximately 65 feet. The maximum depth of the evacuation walkway in underground segments would be approximately 57 feet.

The third rail that provides power to the Metrorail cars could pose a serious safety threat. However, no effects are anticipated along the alignment, as appropriate measures such as fencing and warning signs would be in place. As with the existing Metrorail system, the risk of passengers falling off station platforms and coming into contact with the track would be possible. However, as previously noted, Metrorail stations have a safety zone under the platforms that provides refuge for passengers who fall on the rail guideway.

B. Neighborhoods

No safety or security impacts are anticipated under this alternative.

C. Traffic Increase

Projected increases in vehicle traffic at and near Metrorail stations are described in detail in Chapter 6 of this Final EIS.

D. Trains

In emergency situations, the operation of the LPA along the corridor would follow the existing plans and procedures found in WMATA's Standard Operating Plan. This plan provides procedures to prevent collisions with other Metrorail cars and disruptions in operations along the line or at stations. Typically, if there is a problem along one track, Metrorail service is maintained by a controlled operation of trains in both directions (single tracking) on the second track. Passengers would continue to have direct access to all stations along the line during a single tracking operation.

3.7.5 CONSTRUCTION EFFECTS

This section outlines potential construction safety and security effects resulting from the LPA.

3.7.5.1 No Build Alternative

Under the No Build Alternative there would be no construction-related safety and security effects from the Dulles Corridor Rapid Transit Project. However, there could be effects from the improvements assumed under this alternative. Identification of these effects would be the responsibility of the agencies and jurisdictions responsible for implementing the improvements.

3.7.5.2 Wiehle Avenue Extension

For the Wiehle Avenue Extension, construction effects would be similar to those described below for the LPA east of and including the Wiehle Avenue Station. West of the Wiehle Avenue Station, construction of facilities for Express Bus Service would have minimal construction-related safety and security concerns. All construction activities associated with the LPA would be in compliance with OSHA standards.

3.7.5.3 Full LPA

Construction activities in the Tysons Corner area, along the DIAAH and Dulles Toll Road, and along the Dulles Greenway—especially for pedestrian bridges and rail aerial structures—would result in temporary lane closures, diversion of traffic, and removal of shoulders, potentially affecting traffic safety. However, the contractor would ensure that the effects are minimized by following applicable state and local codes as well as industry standards. Traffic safety maintenance measures, such as signage, would be employed to minimize the effects. In addition, the contractor would coordinate with applicable authorities, including VDOT, to ensure that affects related to construction on the roadways are minimized.

Other construction-related safety and security concerns include safety of the public and construction workers in and around the construction areas. The contractor would follow applicable state and local codes as well as the contractor's standards such as erecting temporary construction fencing and providing the public with information regarding the construction activities to minimize potential effects. Coordination will continue with TSA regarding security procedures for all construction personnel as well as construction activities at Dulles Airport.

3.7.6 MITIGATION

To mitigate any potential effects upon safety and security, WMATA would update its Safety and Security Program with elements required by TSA and/or MWAA. Coordination with these agencies will continue during the project's design.

During construction, strategies to reduce the safety and security effects associated with construction activities could be used, including: temporary construction fencing and security staff to protect the public and the worksite from unauthorized entry of vehicles, people, and animals; and temporary signage to direct motorists and pedestrians around construction areas.

Mutual aid agreements for emergency response would be developed with Arlington County, Fairfax County, MWAA, and Loudoun County. These agreements would identify the roles and responsibilities of each jurisdiction in responding to emergencies, general policing and security, and emergency access. All emergency response procedures along the DIAAH and at Dulles Airport would be subject to MWAA fire and life safety standards. Procedures at other locations would be based on the local jurisdiction's requirements. No tunnel exits of any kind, including vent shafts, emergency access shafts or any other kinds of openings will occur within the secure zone of the airport.

3.8 ENVIRONMENTAL JUSTICE

This section presents the environmental justice effects of the proposed Dulles Corridor Rapid Transit Project.

3.8.1 LEGAL AND REGULATORY CONTEXT

Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, directs federal agencies to "promote nondiscrimination in federal programs substantially affecting human health and the environment, and provide minority and low-income communities access to public information on, and an opportunity for public participation in matters relating to human health or the environment." It also defines the terms "minority" and "low-income" in the context of environmental analysis.

The Council on Environmental Quality (CEQ) has oversight responsibility for and has written guidance regarding the federal government's compliance with Executive Order 12898 and the NEPA process. Likewise, the U.S. Department of Transportation (U.S. DOT) and the U.S. Environmental Protection Agency (EPA) have drafted guidelines to provide these agencies with guidance regarding compliance with environmental justice requirements.

3.8.2 METHODOLOGY

To assess potential environmental justice impacts, EPA guidance recommends that screening first be performed to determine the location of potentially affected low-income and minority populations, followed by a determination of whether disproportionate impacts may occur. The sections below document the process used to identify low-income and minority populations in the Dulles Corridor.

3.8.2.1 Identifying Minority and Low-Income Populations

The study area defined for the Dulles Corridor Rapid Transit Project environmental justice evaluation extends 300 feet to either side of the proposed centerline of the LPA, expanded to a one-half mile radius at proposed station locations. This area was selected based on a review of the anticipated limit of disturbance of the proposed improvements. Furthermore, this area was checked against the results of noise, vibration, and air quality analysis to ensure that all potentially affected environmental justice populations are included in the analysis.

U.S. Census Bureau data were used to identify low-income and minority populations within the study area. Low-income and racial characteristic data at the census block group level from the Census 2000 were used in the analysis. Census 2000 used new subcategories of minority groups. For the purpose of this analysis, these groups have been combined to be consistent with the racial groups described in Executive Order 12898.

Two threshold standards for identifying minority or low-income populations were developed for this project for areas where 50 percent of the population of a census block group is minority or living below the poverty level; or areas where the minority or low-income population of a census block group is at least 10 percentage points higher than the comparison population.

It should be noted that this methodology provides a broad assessment of locations where minority communities could potentially be located. It should not be interpreted that this methodology identifies all areas that meet the “greater than 10 percent” criteria as minority concentrations in and of themselves. The “greater than 10 percent” is used as a broad indicator that there is the potential that a minority or low-income community might be located within a larger census block group. The actual presence is determined by field investigation and coordination with local jurisdictions. This methodology has been used for several environmental justice analyses for transportation projects.

3.8.2.2 Identifying Impacts Disproportionately Affecting Minority and Low-Income Populations

According to U.S. DOT Order 5680.1, a disproportionately high and adverse effect on minority or low-income populations is one that, "(1) is predominately borne by a minority or a low-income population, or (2) will be suffered by the minority population or low-income population and is appreciably more severe or greater in magnitude than the adverse effect that will be suffered by the non-minority population or non-low income population."

3.8.3 EXISTING CONDITIONS

The following sections identify the minority and low-income populations potentially affected by the project.

3.8.3.1 Minority Populations

Census 2000 block groups with populations that are at least 50 percent minority or are at least 10 percent higher than the minority population of the county or the study area as a whole are listed in Table 3.8-1. Six block groups meet at least one of these thresholds. All six block groups and applicable neighborhoods are located in Fairfax County and are shown in Figure 3.8-1. No U.S. Census block groups that meet the thresholds for identification as a minority population are located in the Loudoun County portion of the project corridor. A summary of each block group is provided below.

Table 3.8-1: Census Blocks That Meet Environmental Justice Thresholds

Tract/Block Group	Amer. Indian/ Alaskan Native	Black (not Hispanic origin)	Asian/ Pacific Islander	Hispanic	Mixed-Race Minority	Total Minority
4712 BG3	0.0%	3.1%	**24.6%**	9.7%	2.6%	40.1%
4809 BG8	0.1%	6.3%	14.9%	**27.7%**	0.9%	**50.0%**
4809 BG9	0.2%	9.1%	12.1%	**30.7%**	2.4%	**54.5%**
4810 BG1	0.2%	13.6%	15.1%	**24.8%**	2.6%	**56.3%**
4811 BG1	0.1%	12.8%	**24.4%**	12.8%	3.2%	**53.3%**
4825 BG8	0.2%	10.2%	15.1%	**20.5%**	3.5%	**49.6%**
Fairfax County	0.2%	8.4%	13.0%	11.0%	2.8%	35.4%
Study Area	0.2%	6.0%	12.1%	8.9%	2.1%	29.3%

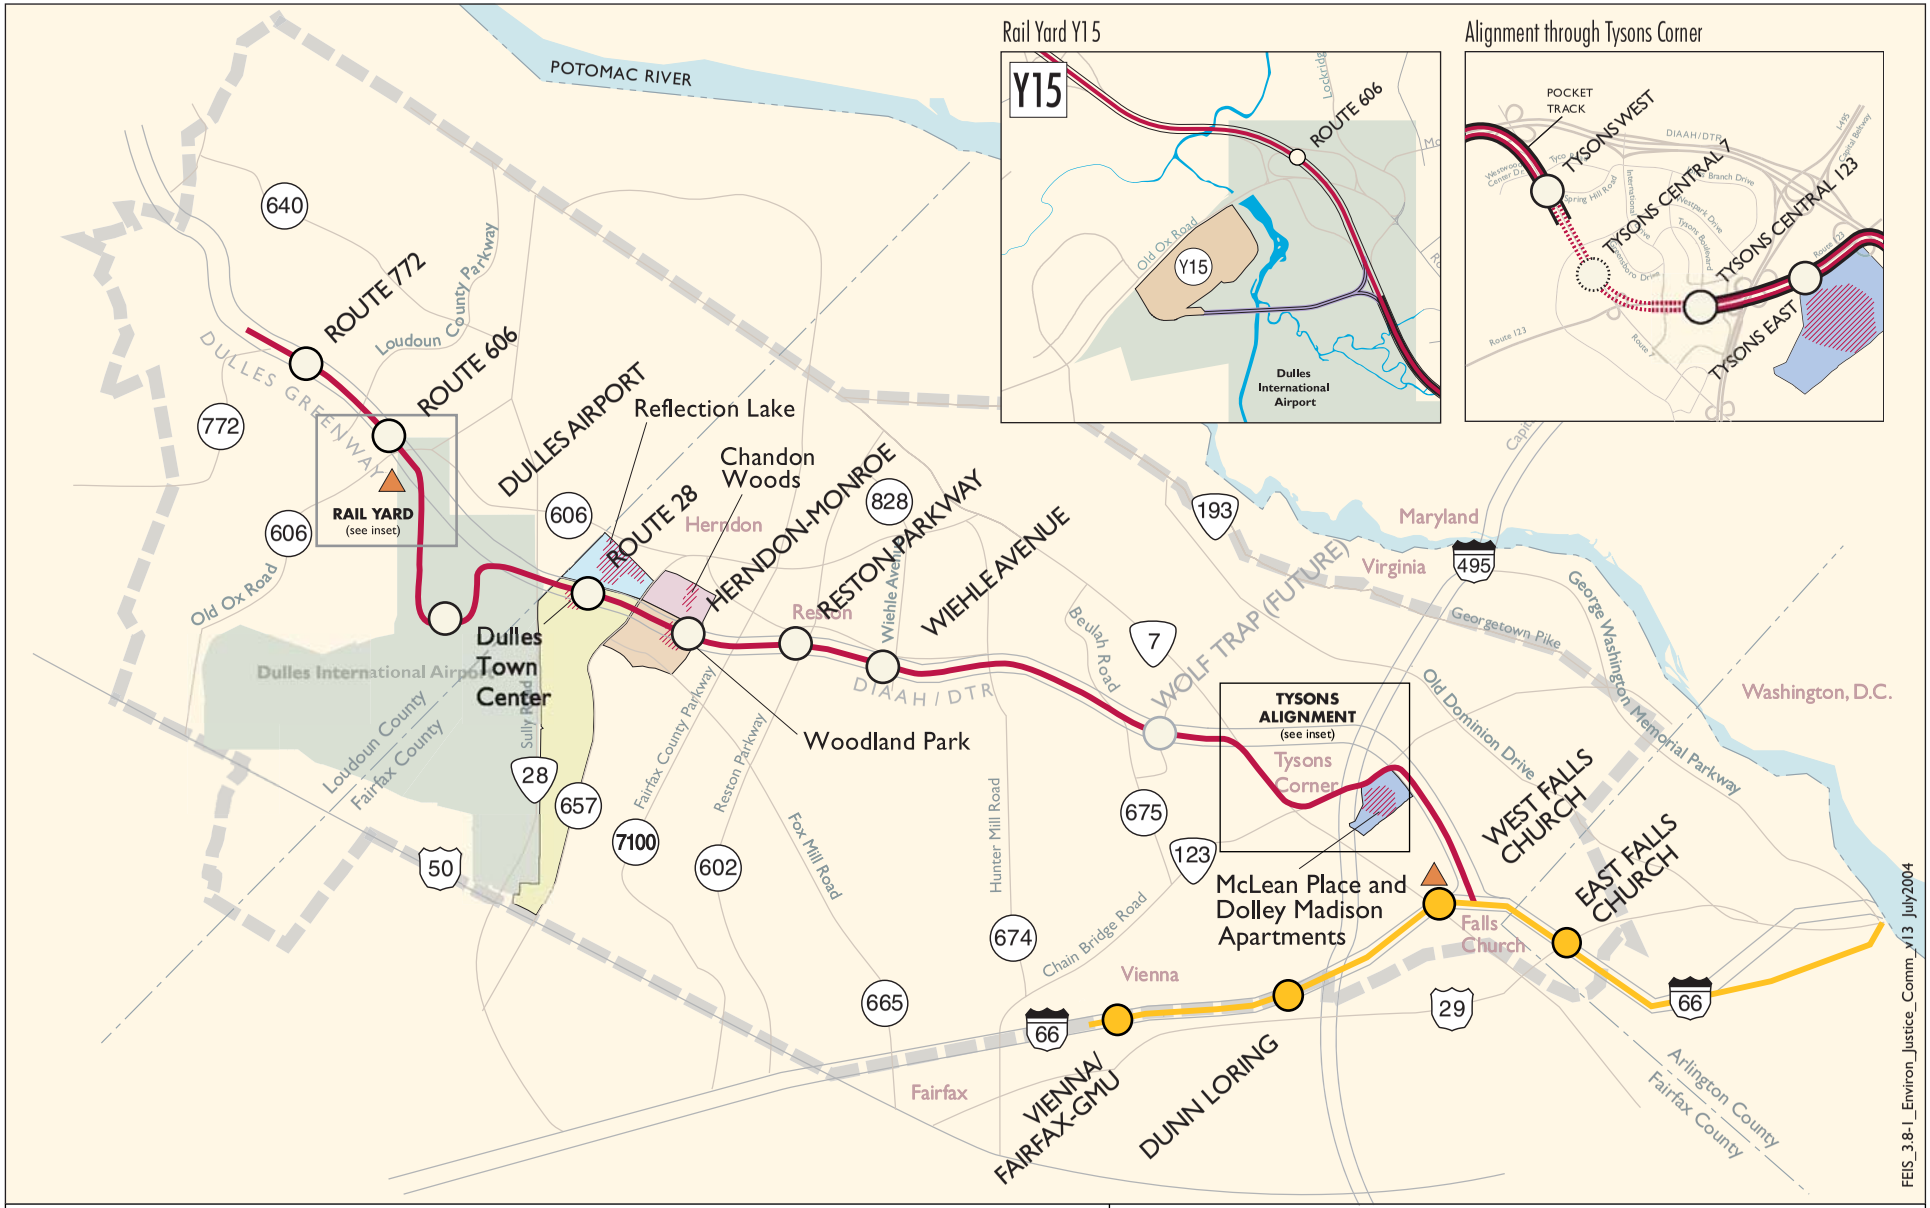
* Percentages that meet minority thresholds are in bold.

** Total Minority figures may not equal the sum of individual categories due to rounding.

*** Mixed-Race Minorities consists of combinations of all racial groups eligible for environmental justice consideration excluding those in the 'Whites and Some Other' category which does not have eligible race components.

Source: U.S. Census Bureau, GCT-PL: 2000 U.S. Census Race and Hispanic or Latino.

A. Tract 4712, Block Group 3



This block group is located east of Tysons Corner and is bordered by Dolley Madison Boulevard, I-495, Magarity Road, and Scott Run (within one-half mile of the Tysons East Station). This block group is largely comprised of multi-family residential neighborhoods, including the McLean Place townhouses and the Dolley Madison Apartments at Tysons. This neighborhood meets the minority threshold because the Asian population is more than 10 percent higher than the Asian population of the county as a whole.

B. Tract 4809, Block Groups 8, and 9

Block Groups 8 and 9 are located on the north side of the DIAAH and are bordered by Van Buren Street, Alabama Drive, and Centreville Road. The residential area within a half-mile radius of the proposed Herndon-Monroe Park and Ride Stop is a portion of the Chandon Woods neighborhood. Chandon Woods is a residential neighborhood with townhouses and single-family homes. Block Groups 8 and 9 meet the minority thresholds because the Hispanic populations are more than 10 percent higher than the Hispanic population of the study area and the county, In addition, the total minority population both Block Groups 8 and 9 also exceeds the 50 percent threshold.

C. Tract 4810, Block Group 1

This block group on the north side of the DIAAH is bordered by Elden Street, Loudoun County, and the Town of Herndon. A portion of the Reflection Lake neighborhood is within a one-half-mile radius of the proposed Herndon-Monroe Park and Ride Stop. Reflection Lake is a neighborhood of townhouses and single-family homes. This block group meets the minority threshold because the Hispanic population is more than 10 percent higher than the Hispanic population of the study area and the county, and because the total minority population is more than 50 percent.

0 1 2 3 MILES

Figure 3.8-1

Environmental Justice Communities

Dulles Corridor Rapid Transit Project

D. Tract 4811, Block Group 1

This block group is located on the south side of the DIAAH between Monroe Street and Centreville Road. A small portion of the block group, containing the Woodland Park townhouse neighborhood (southwest of the intersection of Monroe Street and Sunrise Valley Road), is located in the study area (approximately one-half mile from the proposed Herndon-Monroe Park and Ride Stop). This block group meets the minority threshold because the Asian population is more than 10 percent higher than the Asian population of the study area as a whole, and because the total minority population is greater than 50 percent.

E. Tract 4825, Block Group 8

This block group is located south of the DIAAH and is bordered by the Dulles Toll Road, Centreville Road, Sully Road, and Lee Highway. The residential portion of this block group, which includes the Dulles Town Center complex, is within a half-mile radius of the proposed Route 28 Station site. This block group meets the minority threshold because its Hispanic population is more than 10 percent higher than the Hispanic population of the study area as a whole.

3.8.3.2 Low-Income Populations

None of the Census 2000 block groups that are partially or entirely within the project corridor meets the threshold for low-income populations.

3.8.4 LONG-TERM EFFECTS

This section includes a discussion of the potential disproportionate impacts to minority and low-income populations that would result from the project. The analysis of environmental justice impacts of the LPA consists of a determination of whether environmental impacts identified in other sections of this Final EIS disproportionately affect minority or low-income populations. If no substantial impacts are predicted to occur, then there would be no substantial impacts that disproportionately affect minority or low-income populations. Benefits of the transit improvements to minority or low-income populations are also identified. The long-term effects of the No Build Alternative, the Wiehle Avenue Extension, and the full LPA on environmental justice communities are described in the following sections. Table 3.8-2 presents a summary of these effects.

Table 3.8-2: Effects to Environmental Justice Communities

Environmental Justice Communities (Census Tract, Block Group)	No Build Alternative (2025)	Locally Preferred Alternative		
		Wiehle Avenue Extension Opening Year (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
McLean Place Townhomes, Dolley Madison Apartments at Tysons (Tract 4712, BG3)	No Effect	Located within ½ mile of the proposed Tysons East Station Increased access to transit through Metrorail Service No disproportionate impacts	Located within ½ mile of the proposed Tysons East Station Increased access to transit through Metrorail Service No disproportionate impacts	Located within ½ mile of the proposed Tysons East Station Increased access to transit via proposed Metrorail Service No disproportionate impacts

Environmental Justice Communities (Census Tract, Block Group)	No Build Alternative (2025)	Locally Preferred Alternative		
		Wiehle Avenue Extension Opening Year (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Chandon Woods (Tract 4809, BG8)	No Effect	Located within ½ mile of the Herndon-Monroe Park and Ride Stop Increased access to transit via the proposed Express Bus Service[1] No disproportionate impacts	Located within ½ mile of the Herndon-Monroe Park and Ride Stop Increased access to transit via the proposed Express Bus Service[1] No disproportionate impacts	Located within ½ mile of the Herndon-Monroe Park and Ride Station Increased access to transit via proposed Metrorail Service No disproportionate impacts
Chandon Woods (Tract 4809, BG9)	No Effect	Located within ½ mile of the Herndon-Monroe Park and Ride Stop Increased access to transit via the proposed Express Bus Service[1] No disproportionate impacts	Located within ½ mile of the Herndon-Monroe Park and Ride Stop Increased access to transit via the proposed Express Bus Service[1] No disproportionate impacts	Located within ½ mile of the Herndon-Monroe Park and Ride Station Increased access to transit via proposed Metrorail Service No disproportionate impacts
Reflection Lake (Tract 4810, BG1)	No Effect	Located within ½ mile of the Herndon-Monroe Park-and-Ride stop Increased access to transit via the proposed Express Bus Service[1] No disproportionate impacts	Located within ½ mile of the Herndon-Monroe Park-and-Ride stop Increased access to transit via the proposed Express Bus Service[1] No disproportionate impacts	Located within ½ mile of the Herndon-Monroe Park-and-Ride stop Increased access to transit via proposed Metrorail Service No disproportionate impacts
Woodland Park (Tract 4811, BG1)	No Effect	Located within ½ mile of the Herndon-Monroe Park-and-Ride stop Increased access to transit via the proposed Express Bus Service[1] No disproportionate impacts	Located within ½ mile of the Herndon-Monroe Park-and-Ride stop Increased access to transit via the proposed Express Bus Service[1] No disproportionate impacts	Located within ½ mile of the Herndon-Monroe Park-and- Ride stop Increased access to transit via proposed Metrorail Service No disproportionate impacts
Dulles Town Center (Tract 4825, BG8)	No Effect	Access to transit at the Herndon-Monroe Park-and-Ride Stop via the proposed Express Bus Service[1] No disproportionate impacts	Access to transit at the Herndon-Monroe Park-and-Ride stop via the proposed Express Bus Service[1] No disproportionate impacts	Located within ½ mile of the proposed Route 28 Station Increased access to transit via proposed Metrorail Service No disproportionate impacts

1 Express bus service would serve areas west of Wiehle Avenue and provide connections to Metrorail.

3.8.4.1 No Build Alternative

Under the No Build Alternative, the six minority block groups would not benefit from increased accessibility that transit improvements in the corridor would bring. Effects on minority and low-income populations could result from improvements assumed under the No Build Alternative. However, identification of these effects would be the responsibility of the agencies and jurisdictions responsible for implementing the improvements.

3.8.4.2 Wiehle Avenue Extension

The Wiehle Avenue Extension would provide Metrorail service from the Orange line East Falls Church Station to Wiehle Avenue and Express Bus Service from Wiehle Avenue to Route 772. Under the Wiehle Avenue Extension, environmental justice areas west of Wiehle Avenue, including Chandon Woods,

Woodland Park, Reflection Lake, and Dulles Town Center communities would receive bus service rather than rail transit service. Therefore, the only environmental justice community that would have direct access to Metrorail service under the Wiehle Avenue Extension would be the community associated with the McLean Place Townhomes and Dolley Madison Apartments, which is near the proposed Tysons East Station. The Chandon Woods, Woodland Park, Reflection Lake, and Dulles Town Center communities would have access to the proposed Express Bus Service via the Herndon-Monroe Park-and-Ride stop. Disproportionate impacts would not occur under the Wiehle Avenue Extension.

Some noise, visual, economic, and traffic impacts would occur. However, none of the environmental justice populations identified would be disproportionately affected. Displacements and relocations would occur within Tysons Corner under the Wiehle Avenue Extension; however, none of the environmental justice populations identified would be displaced.

3.8.4.3 Full LPA

The six minority block groups identified would benefit from the increased accessibility that the full LPA would provide.

Some noise, visual, economic, and traffic impacts would occur as a result of the LPA. However, none of the environmental justice populations identified would be disproportionately affected. Displacements and relocations would occur within Tysons Corner under the LPA; however, none of the environmental justice populations identified would be displaced.

3.8.5 CONSTRUCTION EFFECTS

This section includes a discussion of the potential disproportionate effects to minority and low-income populations that would result from construction of the LPA.

3.8.5.1 No Build Alternative

Under the No Build Alternative, there would be no effects from the Dulles Corridor Rapid Transit Project. However, construction-related impacts (and/or disproportionate effects) to the identified environmental justice populations could result from the improvements assumed under this alternative. Identification of these effects would be the responsibility of the agencies and jurisdictions responsible for implementing the improvements.

3.8.5.2 Wiehle Avenue Extension

Construction activities related to the Wiehle Avenue Extension between the Orange Line and Wiehle Avenue would not disproportionately affect the one minority community identified within the McLean Place Townhomes and Dolley Madison Apartments at Tysons Corner. Construction of facilities for Express Bus Service under the Wiehle Avenue Extension would have limited potential for disproportionate effects.

3.8.5.3 Full LPA

Construction staging areas could result in short-term air quality, noise and visual impacts along the alignment. These staging areas would be placed to avoid disproportionately affecting any of the six minority block groups.

3.8.6 MITIGATION

No disproportionate impacts to minority or low-income populations are anticipated from either the Wiehle Avenue Extension or the full LPA. Therefore, no mitigation measures are proposed.

3.8.7 PUBLIC INVOLVEMENT OUTREACH

Executive Order 12898 directs agencies to utilize existing law to ensure that they provide opportunities for community input in the NEPA process, including input on potential effects and mitigation measures. The public involvement program is discussed in Chapter 11.

Additional public outreach efforts included the addition of contacts within minority communities to the project mailing list: presidents of neighborhood associations, resident managers, property management companies, and neighborhood resource coordinators.

Significant outreach activities included mass distribution of flyers and newsletters throughout the corridor, speaking engagements, a project kiosk at Tysons Corner Center and a public information center in Reston, and special outreach at community events. Specific outreach focusing on minority populations within the corridor was conducted in advance of all public meetings.

Outreach to minority populations would continue throughout the NEPA process and the design and construction phases of the project. Any press releases advertising public hearings or other public project meetings were sent to communications outlets directed toward minority communities in the region, including Asian Fortune, El Tiempo Latino, Impacto (Latino), Iran Times, Pho No (Vietnamese), Washington Afro-American, Washington Hispanic, Metro Herald (African American), Telemundo TV (Latino), WHUR FM (African American), and WKYS FM (African American).

4 ENVIRONMENTAL EFFECTS

This chapter of the Final EIS for the Dulles Corridor Rapid Transit Project describes the existing conditions of the natural and built environments. The No Build Alternative, the Wiehle Avenue Extension, and the full Locally Preferred Alternative (LPA) have been analyzed to determine the potential effects each would have upon the study area's natural resources, its habitats, and by-products of the built environment such as noise, hazardous materials, and energy consumption.

The alternative formerly known as "LPA Phase 1" in the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* has been renamed the Wiehle Avenue Extension in this Final EIS and is expected to begin operations in 2011. This change reflects the federal approach to the project's funding under the Federal Transit Administration's New Starts program. It will assure consistency among the environmental, engineering and financial documents during the project's development.

In the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* as well as this Final EIS, the term "full LPA" represents the Wiehle Avenue Extension and the second phase of the Dulles Corridor Rapid Transit Project. This second phase would extend west from Wiehle Avenue to Washington Dulles International Airport and Route 772 and is expected to begin operations in 2015.

The term "LPA", "proposed action", or "selected LPA" refers to both the Wiehle Avenue Extension and the full LPA collectively.

Each section includes a description of the study area defined for each environmental resource, the methods used to make the assessments, and the existing conditions of each resource. Study area definitions vary according to the resource being studied. The study area is generally the limits of disturbance for the proposed improvements for water resources, terrestrial biota and habitat. For other resource elements, the study area differs from the limit of disturbance. For example, air quality requires two study areas. The first would encompass the entire Washington metropolitan region and the second includes the areas immediately surrounding the proposed transit facilities where cars and buses would queue (e.g., intersections).

The sections also include, for each alternative, a discussion of the potential long-term effects, potential construction (short-term) effects, and mitigation for those effects when warranted. Briefly, the sections of this chapter address the following issues:

Section 4.1 provides an assessment of the effects to the geologic resources along and adjacent to the study area including the geology, topography, soils, prime farmlands, and groundwater within the Dulles Corridor.

Section 4.2 includes a description of the effects to streams, floodplains, wetlands, and critical areas that make up the surface waters in the study area.

Section 4.3 includes an examination of the effects to aquatic biota and habitat that exist in the study area.

Section 4.4 provides a description of the effects to terrestrial biota and habitat that are present within the study area.

Section 4.5 includes an assessment of the plant and animal species that are classified as rare, threatened, or endangered and are likely to exist in the study area.

Section 4.6 provides a description of the air quality impact analysis conducted for the project.

Section 4.7 presents the results of the ambient noise monitoring program and the evaluation of potential impacts.

Section 4.8 presents the results of the existing source vibration measurement program and an evaluation of potential impacts of the proposed improvements.

Section 4.9 includes a description of the potential for discovering hazardous or contaminated materials during construction of the project and a summary of the extent of any suspected contamination and appropriate mitigation measures.

Section 4.10 provides a summary of the quantitative assessment of the impact of the project on transportation-related energy consumption in the study area.

Additional information on agency coordination undertaken to address natural resources addressed in this Chapter is discussed in Appendices J and K.

4.1 GEOLOGIC RESOURCES

Geologic resources include geology, groundwater, topography, soils, and prime farmland.

4.1.1 LEGAL AND REGULATORY CONTEXT

Laws regarding sole source aquifers and prime farmlands are pertinent to defining geological resources. The Sole Source Aquifer Protection Program is authorized by the Safe Drinking Water Act of 1974, as amended in 1986 and 1996, to protect drinking water and its sources. Aquifers are designated as “Sole Source” to protect drinking water supplies in areas with few or no alternative sources of potable water.

The protection of prime farmland is promulgated under Title 7 of the United States Code, Chapter 73—the Farmland Protection Policy. The purpose of the policy is to minimize the extent to which Federal programs contribute to the unnecessary and irreversible conversion of farmland to nonagricultural uses, and to assure that federal programs are compatible with state, local, and private programs and policies to protect farmland.

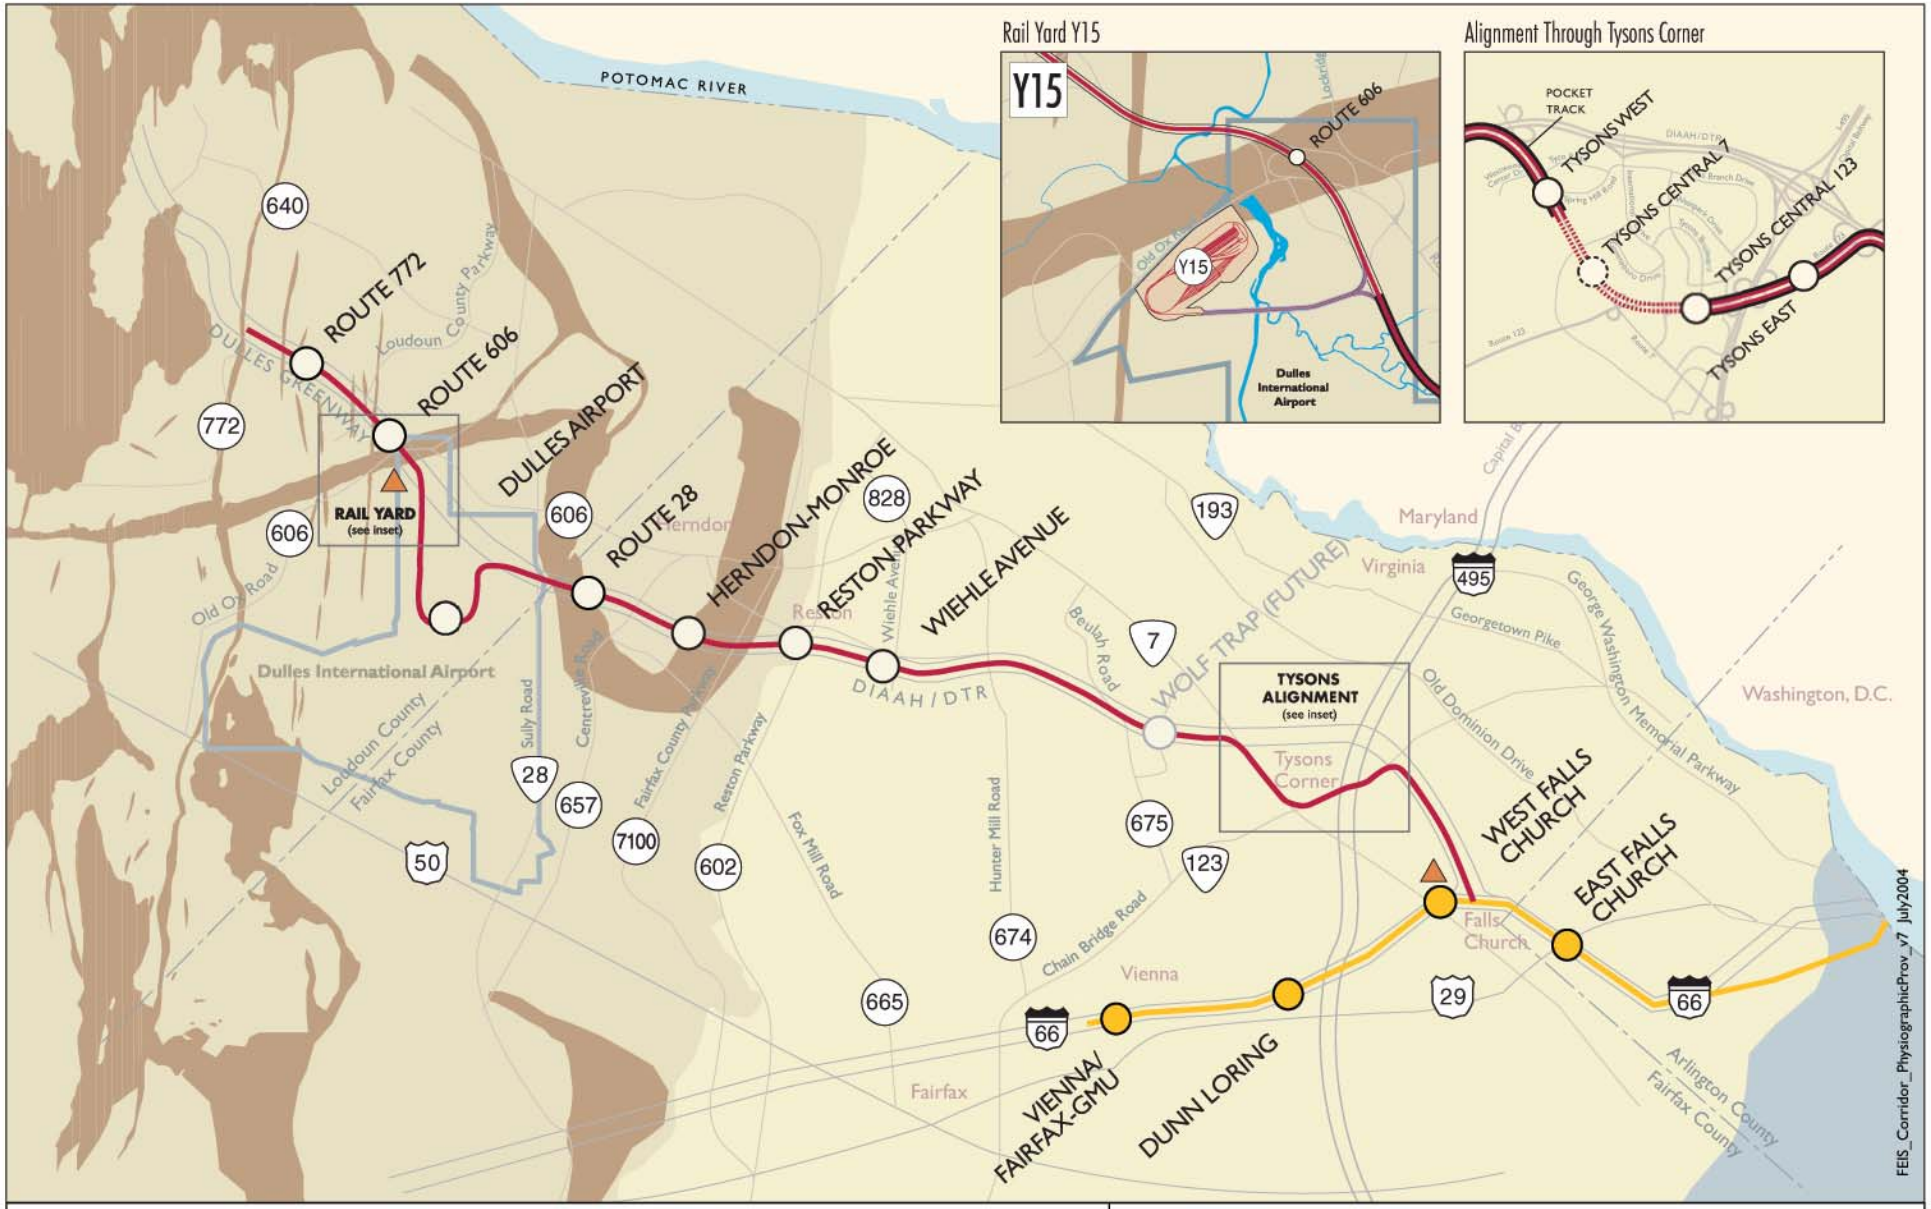
4.1.2 METHODOLOGY

Research was the principal method used to gather information about the geologic resources within the study area in Fairfax and Loudoun counties. Geology, topography, and groundwater information was obtained from U.S. Geological Survey (USGS) maps and atlases. Soil and prime farmland data were compiled from the U.S. Environmental Protection Agency (EPA), the U.S. Department of Agriculture (USDA), the Virginia Department of Health, and various local and regional resource agencies. Additional information was obtained from websites, local and regional plans, project engineering studies and investigations, and personal communications with representatives from various federal, state, and local agencies.

The study area for geologic resources was generally defined as the Dulles Corridor, an area that extends from Route 7 to the north, I-66 to the south, a point beyond Route 772 in Loudoun County to the west, and a point beyond the City of Falls Church in Arlington County to the east. For soils, the study area was reduced to the predicted limits of disturbance.

4.1.3 EXISTING CONDITIONS

A description of the existing conditions of the geologic resources underlying the study area follows.



4.1.3.1 Geology and Topography

Virginia consists of five Physiographic Provinces: the Coastal Plain, Piedmont, Blue Ridge, Valley and Ridge and Appalachian. The study area is generally located in the Piedmont Physiographic Province, which lies between the Coastal Plain to the east and the Blue Ridge to the west. The Piedmont Physiographic Province can be subdivided into the Piedmont upland and Triassic lowland. Crystalline metamorphic rocks such as schist, granite, gneiss, and greenstone of the late Precambrian or early Paleozoic age underlie the Piedmont upland. Figure 4.1-1 shows the geology located within the study area and surrounding area.

The Triassic lowland, also referred to as the Culpeper Basin, in western Fairfax County and eastern Loudoun County, begins approximately at Reston Parkway. The lowland is an area of much younger, un-metamorphosed, red sedimentary rock (sandstone, siltstone, shale, and conglomerate), and igneous rock. Exposed igneous intrusions (diabase, diorite, and syenite) are present sporadically throughout the Triassic lowland, as shown in Figure 4.1-1. A horseshoe-shaped igneous intrusion crosses the study area just west of Reston. Another intrusion intersects the corridor at the northern end of Dulles Airport. Some of these intrusions, composed of diabase flat rock (a hard, dark-colored volcanic rock), are home to a community known as the diabase glade habitat. This community is explained in detail in Section 4.5.

The Triassic lowlands range in elevation from approximately 250 feet to 400 feet above mean sea level. The lowlands slope toward the southwest and are adjacent to the higher Piedmont uplands to the east. The Piedmont uplands range in elevation from 300 feet to 450 feet above mean sea level. Ground elevations of the study area gradually decline westward from Tysons Corner to Difficult Run, and then rise to 400 feet above mean sea level south of Sunset Hills Road. At the transition between the uplands and lowlands, the topography begins to flatten out, with elevations of approximately 380 feet above mean sea level. From the Dulles International Airport Access Highway (DIAAH) and Route 28 interchange, the ground elevation declines to 250 feet above mean sea level and rises again to about 300 feet above mean sea level at the project terminus in Loudoun County. Within Tysons Corner, ground elevations rise southward to approximately 450 feet above mean sea level.

Geology

Dulles Corridor Rapid Transit Project

4.1.3.2 Groundwater

Several types of aquifers underlie the Dulles Corridor. Crystalline-rock and undifferentiated sedimentary-rock aquifers underlie the Piedmont upland. This dense, almost impermeable bedrock yields water primarily from secondary porosity and permeability provided by fractures. Groundwater levels measured during project geotechnical investigations at various locations within the study area indicated that ground water levels ranged from 23 to 34 feet below the ground surface in the vicinity of Tysons Corner and 14 to 17 feet below the ground surface between Reston and Loudoun County. Geotechnical borings drilled in Loudoun County did not encounter groundwater. Water from aquifers underlying both topographic regions within the study area is suitable for drinking, but iron, manganese, and sulfate are often present at elevated concentrations in isolated areas.

The nearest Sole Source Aquifers are the Maryland Piedmont Aquifer and Poolesville Area Aquifer. As indicated by EPA, Region III, these aquifers lie within the political and geographic jurisdictions of Frederick and Montgomery counties in Maryland. There are no sole source aquifers in Fairfax or Loudoun counties.

According to the Fairfax County Water Authority (FCWA) and the Loudoun County Sanitation Authority, the primary source of drinking water in the study area is surface water. The Fairfax County Water Authority obtains water from the Potomac River with an intake situated above Great Falls. Groundwater is the source of drinking water for some older homes in various parts of the Dulles Corridor. Although the Commonwealth of Virginia does not have an EPA-mandated or regulated wellhead protection program to protect these groundwater wells from contamination, the Commonwealth works with localities and waterworks via the Virginia Rural Water Association who coordinates the Source Water Assessment Program. As part of this program, the Virginia Department of Health performs vulnerability assessments of groundwater wells based on 1,000-foot fixed-radius zones. The study area for geologic resources crosses into the 1,000-foot radius for four drinking water wells. The wells are in the following locations: the Hunter Mill Swim and Racquet Club, the Reston Presbyterian Church, west of the Loudoun/Fairfax County line to the north of the Dulles Greenway, and southwest of the Dulles Greenway along the north side of Route 606.

4.1.3.3 Soils

Soils within the study area vary according to the underlying geology—Coastal Plain, Piedmont Upland, Triassic Lowland, and Igneous Intrusion. Tables 4.1-1 and 4.1-2 list the soil types and various characteristics of each soil within the study area.

Within the Piedmont Upland, areas of greenstone bedrock underlying the Lloyd, Orange, and Rocky Land soil types could contain naturally occurring fibrous asbestos minerals. Figure 4.1-2 shows the approximate location of these soil types in the study area. The alignment passes over igneous diabase intrusions west of Reston and at the northern end of Dulles Airport. Most of the soils in this region belong to the Iredell soils group, a problematic soil that shrinks and swells depending on water content.

Table 4.1-1: Study Area Soils – Fairfax County

Soil Name (Symbol)	Depth to Bedrock (Feet bgs)	Depth to Water Table (Inches)	Slope (%)	Soil Drainage	Shrink to Swell Potential
Piedmont Upland					
Mixed Alluvial Sand (Mr)	3 to 30	n.a.	0 to 2	Good	Variable

4.1.3.4 Prime Farmland

The USDA defines prime farmland as land that has the best combination of physical and chemical characteristics for producing food, feed, forage, fiber, and oil seed crops, and land that is also available for these uses. Prime farmland can be cropland, pastureland, forestland, or other land, but not urban built-up land or water. Land designated as "prime farmland" has the soil quality, growing season, and moisture supply needed to economically produce sustained high yields of crops when treated and managed according to acceptable farming methods.

Most of the study area is located within Fairfax County, which is highly developed and densely populated. Consequently, prime farmland soils in the study area have been developed into residential neighborhoods or commercial centers. Loudoun County, in contrast, is a mix of suburban and rural development. Data obtained from the Loudoun County Office of Mapping and Geographic Information indicate that three small areas with Panorama silt loam, a soil designated as prime farmland, exist in proximity to the alignment in Loudoun County (See Figure 4.1-3). Coordination with the Natural Resources Conservation Service (NRCS) confirmed these areas and the soil types that are considered prime for farmland.

4.1.4 LONG-TERM EFFECTS

The long-term effects of the No Build Alternative and the full LPA on geologic resources are described in the following sections. Table 4.1-3 presents a summary of these effects.

Table 4.1-3: Summary of Effects to Geologic Resources

Geologic Resource	No Build Alternative	Locally Preferred Alternative		
		Wiehle Avenue Extension Opening Year (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Geology	None	Minor	Minor	Minor
Topography	None	Minor	Minor	Minor
Sole Source Aquifers	None	None	None	None
Groundwater	None	Minor	Minor	Minor
Soils	None	Minor	Minor	Minor
Prime Farmlands[1]	None	None	None	Minor

[1] Affected prime farmland soils would not be usable as prime farmland because of their small size and isolated nature. In addition, prime farmlands affected within the study area are slated for conversion to urban use per the *Loudoun County Revised General Plan*.

4.1.4.1 No Build Alternative

Under the No Build Alternative, there would be no project related effects to geologic resources.

4.1.4.2 Wiehle Avenue Extension

Minor long-term effects on the geology and topography within the study area are expected from the Wiehle Avenue Extension as a result of tunneling at underground segments and pier and pile construction for the support of structures. Geotechnical investigations and subsurface studies at specific locations would be conducted prior to construction activities to ascertain more detailed information on geologic formations and soils.

The Wiehle Avenue Extension would result in an increase in impervious surface. This would have a minor effect on the groundwater recharge capacity of local aquifers. This effect would be partially offset by the increased aquifer recharge that would occur as a result of the proposed stormwater management facilities. There is no potential for impacts to sole source aquifers.

As depicted in Figure 4.1-2, the Lloyd soil type (potentially containing the asbestos mineral) lies near the Wiehle Avenue Extension around its intersection with Hunter Mill Road. According to Fairfax County Health Department directives, a compliance plan would be required for the potential of disturbing the Lloyd soil. The extent of the plan would depend on the construction activity planned for that area. It is not anticipated that soils containing natural asbestos or those with the propensity to shrink and swell would be encountered in other areas along the Wiehle Avenue Extension.

Minor effects on the soils of the project corridor are expected from the Wiehle Avenue Extension. In addition, no effects to prime farmland would occur as result of the Wiehle Avenue Extension.

4.1.4.3 Full LPA

The effects of the full LPA on geology, topography, groundwater, and soils are similar to those described above for the Wiehle Avenue Extension. However, soils that have the propensity to shrink and swell could be encountered in the portions of the corridor through Reston, Herndon, and Loudoun County; it is not anticipated that soils containing natural asbestos would be encountered west of Wiehle Avenue.

The station facilities at Route 772 and the Metrorail Service and Inspection (S&I) Yard Site 15 would affect several small, non-contiguous parcels of prime farmland. However, these areas (according to the *Loudoun County Revised General Plan* and MWAA's *Airport Land Use Plan*) are unlikely to be available for use as prime farmland. The land near the Route 772 station will be converted to urban uses regardless of the implementation of the full LPA and the land for S&I Yard 15 is part of Dulles Airport. In a letter dated July 8, 2002, the Natural Resources Conservation Service noted that impacts to prime farmland were adequately documented in the Draft EIS and accordingly had no objection to the proposal to implement the project.

4.1.5 CONSTRUCTION EFFECTS

Short-term impacts on the existing geology, topography, and soils in the area would be anticipated. Best Management Practices would be used during intrusive activity, thereby minimizing any short-term impacts to geologic structures during project construction. There would be no difference in the construction effects of the Wiehle Avenue Extension and full LPA except that the effects from the full LPA would occur along a greater area. Best Management Practices, such as pollution control devices, spill prevention programs, installation and maintenance of runoff diversion structures and secondary containment structures would be employed for all construction activities. Sediment and erosion control plans will be prepared and submitted to the appropriate soil and water conservation jurisdictions.

Potential construction effects of the LPA on the geology, topography and soils underlying the study area would be associated with the following activities: leveling for the tracks, mostly in the median of the DIAAH; clearing, grubbing, and leveling for the Metrorail S&I Yard; constructing new embankments or altering existing embankments at bridge and tunnel approaches; drilling shafts and driving piles for structure foundations, and earth removal activities for the tunnel sections in Tysons Corner and at Dulles Airport. Surface excavations, construction of tunnels, hill cuts, and pile driving would be the most intrusive construction methods.

Several soil types have moderate to poor drainage, a high to very high shrink-swell potential, and/or a high water table. In addition, some soils on steep slopes have high erosion potentials. There is also a possibility of exposing soils overlying greenstone bedrock that could contain fibrous asbestos minerals. In the event that these soils are encountered, preparation and submission of an asbestos control compliance plan to the Fairfax County Health Department prior to construction activities in areas with the potential for asbestos-containing soils will be required. The extent of the plan is contingent upon the construction activities planned for the area(s) of concern.

Because the LPA would involve construction of underground segments of the alignment, minor impacts to groundwater quality, temporary groundwater depletion, and/or stormwater run-off could occur. Excavation for retained fill sections for the stations and underground sections could encounter groundwater, but short-term effects are expected to be minimal. Where groundwater could be encountered, wells can be constructed and groundwater pumped out for the purpose of depressing groundwater elevations in the vicinity of the work. For this activity, a Groundwater Withdrawal Permit would be required from the Virginia Department of Environmental Quality (VDEQ). The underground sections would be waterproofed to inhibit the flow of groundwater into the tunnel after construction. Groundwater elevations are expected to return to preconstruction levels when construction of underground segments is complete.

If rainwater or other water seepage collects in the tunnels during construction, Virginia Pollution Discharge Elimination System (VPDES) and Virginia Water Protection permits would be required to

discharge the water into adjacent surface waters. The VPDES permit meets EPA's requirements, eliminating the need for a Federal National Pollutant Discharge Elimination System permit, although additional permitting or review by EPA may be required depending on the quantity and content of the discharge.

No construction effects to prime farmland are expected from implementing the Wiehle Avenue Extension or the full LPA.

4.1.6 MITIGATION

No long-term impacts to geologic resources (e.g. geology, groundwater, soils, and prime farmland) are anticipated. Therefore, no mitigation measures are proposed.

During construction, Best Management Practices would be used to minimize impacts to soils and groundwater resources. A Soil and Erosion Sediment Control Plan would be prepared.

4.2 WATER RESOURCES

This section describes the effects to water resources within the Dulles Corridor, including surface water (e.g., streams), wetland systems, and floodplains, as well as critical areas such as Chesapeake Bay Protection Areas, environmental quality corridors, and river and stream corridor overlay districts.

4.2.1 LEGAL AND REGULATORY CONTEXT

The Clean Water Act mandates that state and federal water quality standards are met for activities that result in the discharge of materials to "Waters of the U.S." Section 401 of the Clean Water Act requires that anyone intending to dredge or fill a waterway or wetland obtain a Certification. The U.S. Army Corps of Engineers (USACE), in accordance with Executive Order 11990, "Protection of Wetlands," and Section 404 of the Clean Water Act regulates the "Waters of the U.S.," which include wetlands. U.S. DOT Order 5660.1A requires transportation facilities and projects to assure the protection, preservation, and enhancement of the nation's wetlands to the fullest extent practicable during the planning, construction, and operations. The Virginia Water Protection (VWP) permit program regulates impacts to state waters, including wetlands, and serves as Virginia's Section 401 certification program for federal Section 404 permits. According to March 2002 legislation, the Commonwealth has delegated the regulation of isolated intrastate wetlands and waters to VDEQ. A Joint Permit Application must be submitted to the Virginia Marine Resources Commission (VMRC) for any work performed in, over, or under waters within the Commonwealth of Virginia. VMRC distributes the permit application for review and comment to USACE, VDEQ, and other relevant state, local, and federal agencies.

EPA's Total Maximum Daily Load (TMDL) program provides guidelines for identifying impaired waters and determining pollution sources. A TMDL is the amount of pollutant that surface water can assimilate without causing violation of a numeric water quality standard. Section 303(d) of the Clean Water Act requires each state to identify surface waters that do not meet water quality standards. Impaired surface waters are placed on a 303(d) list, termed the TMDL Priority List, for a specific pollutant and could be listed multiple times for different pollutants.

Pursuant to Section 402 of the Clean Water Act, a National Pollutant Discharge Elimination System (NPDES) permit is required for point source discharges. In the Commonwealth of Virginia, VDEQ

regulates Section 402 permitting through the VPDES permit process. Certain construction activities, such as land disturbance and dewatering of excavated areas that would result in stormwater discharges would require a VPDES permit. Depending upon the quantity and content of the discharge, either an individual or general VPDES permit would be required. EPA has the authority to review activities having major discharges.

Stormwater management efforts would be in accordance with Virginia Stormwater Management Regulations (VR 215-02-00 Part IV and S2.3). The Northern Virginia Best Management Practices Handbook contains the required information and calculations for post-construction stormwater quality management. The Northern Virginia Regional Commission can also provide guidance on maintaining existing Best Management Practices.

Pursuant to the Rivers and Harbors Act of 1899, activities affecting navigable waters of the U.S. are also regulated by USACE. Activities regulated under Section 10 include the construction of structures in, under, and over navigable waters, as well as the excavation and deposition of material in navigable waters.

Executive Order 11988, "Floodplain Management," and U.S. Department of Transportation (U.S. DOT) Order 5650.2, "Floodplain Management and Protection" prescribe policies and procedures for the avoidance and mitigation of floodplain impacts. In addition, VDEQ and Loudoun County have developed floodplain management measures pursuant to stormwater management ordinances. Fairfax County's floodplain management measures are contained in the County's Zoning Ordinance.

The Chesapeake Bay Preservation Act establishes criteria for use by Fairfax County to designate Chesapeake Bay Preservation Areas (CBPAs) within their jurisdictions.

The Coastal Zone Management Act of 1972 and reauthorization amendments of 1990 require that federal actions that are likely to affect any land or water use or natural resources of the coastal zone be consistent with the enforceable policies of a state coastal management program. The Commonwealth established the Virginia Coastal Resources Management Program in 1986 to protect and manage Virginia's coastal zone. In response to the 1990 amendments, the Commonwealth completed its Nonpoint Source Pollution Management Program in 1999.

The Loudoun County Revised General Plan defines a River and Stream Corridor Overlay District (RSCOD) as a designation used to classify rivers and streams draining 100 acres or more; associated 100-year floodplains; adjacent steep slope areas; a management buffer; a minimum no-build stream buffer; and wetlands, riparian forests, and historic and archaeological sites to the extent that they fall within the RSCOD.

The Federal Aviation Administration's (FAA) Advisory Circular No. 150/5200-33 recommends limiting wildlife use of wet areas within an airport's approach or departure airspace, aircraft movement areas, loading ramps, or aircraft parking areas because they may cause conditions that are hazardous to aircraft safety. Human-made or natural wet areas, such as poorly drained areas, retention ponds, and wetland systems provide a habitat for wildlife.

4.2.2 METHODOLOGY

The study area for natural resources was determined as a 600-foot-wide corridor that included the Dulles Connector Road, DIAAH, and Dulles Greenway, expanded to widths of 800 to 2,000 feet depending on

the proposed facilities. The study area was delineated based on the potential for disturbance from all conceivable project facilities.

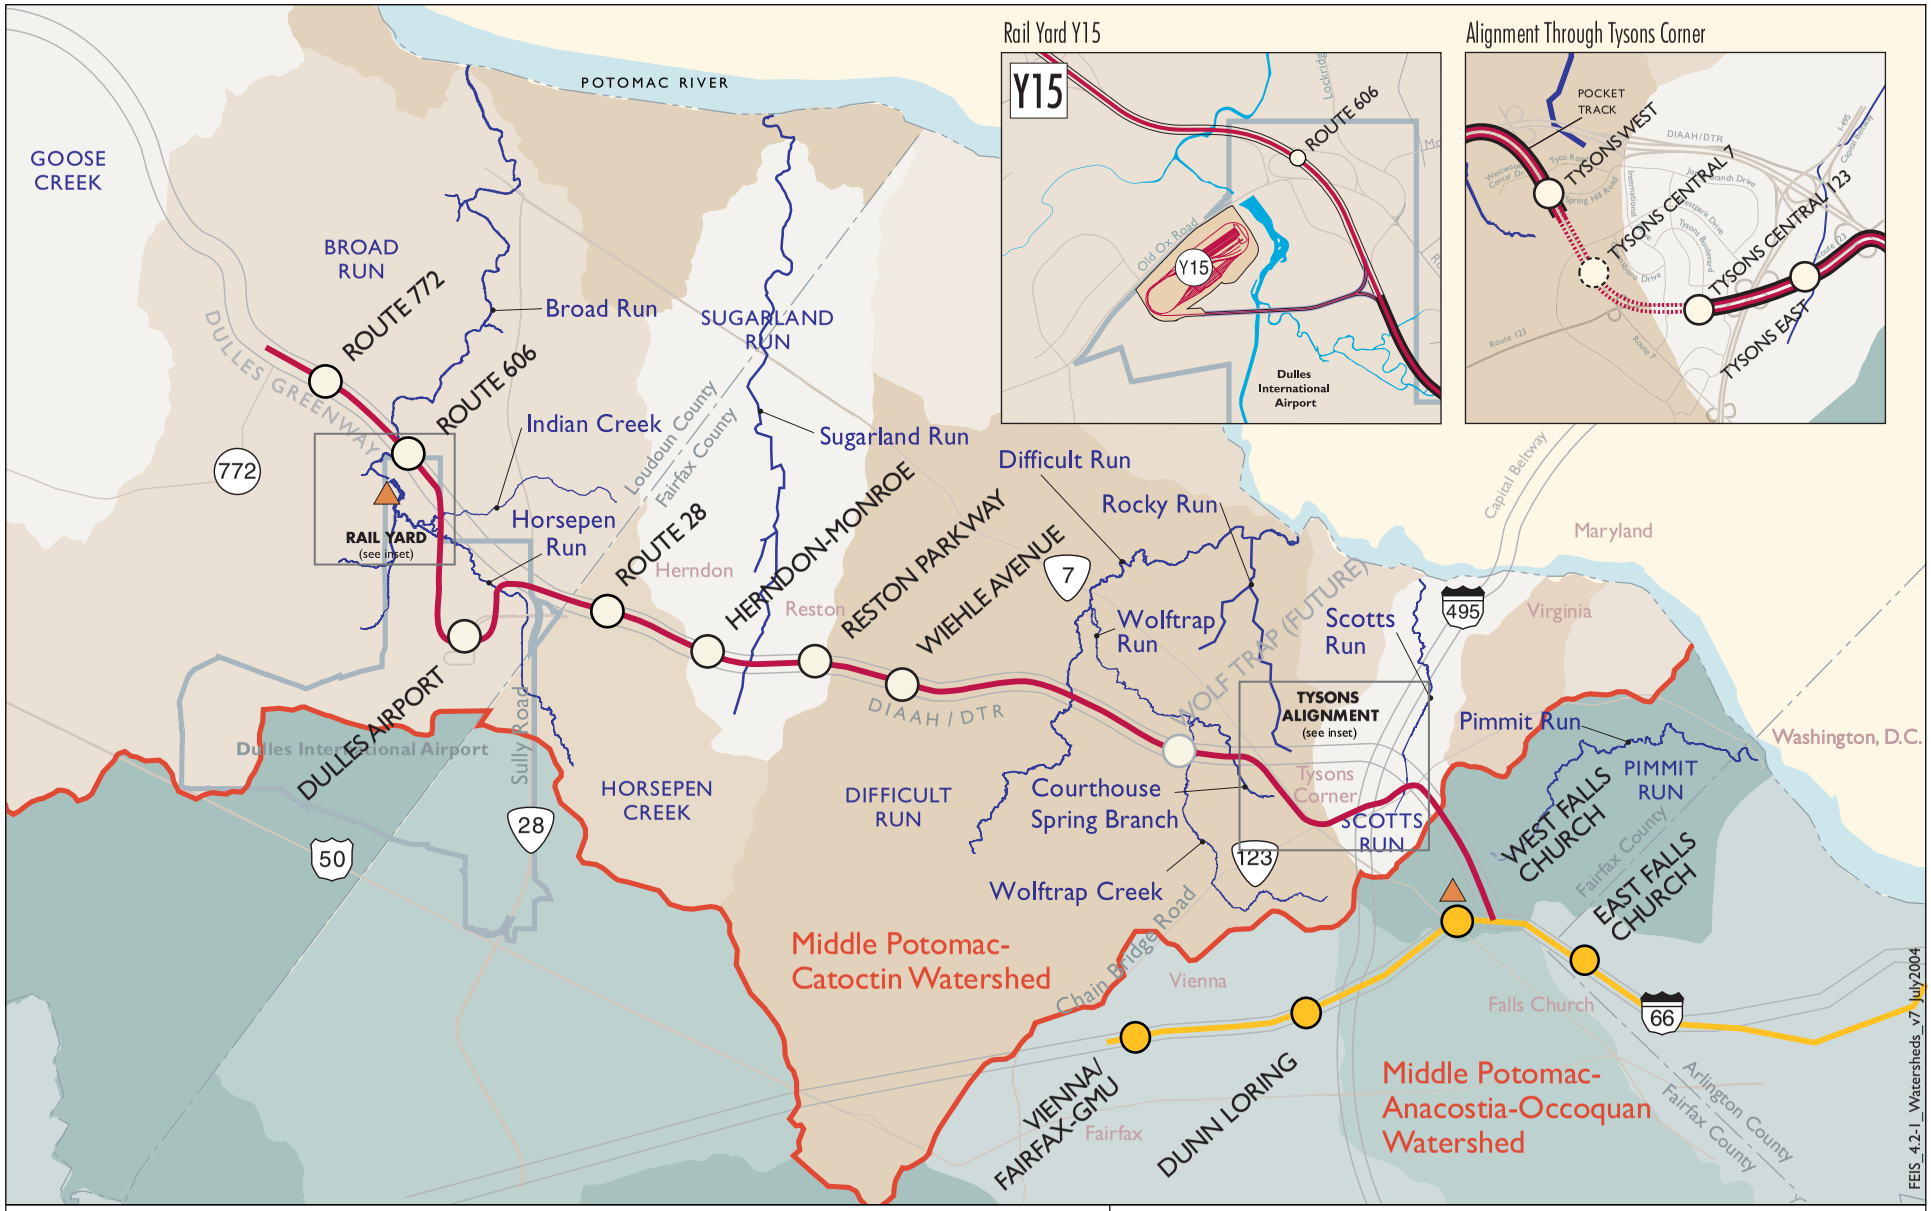
As required by the Clean Water Act, VDEQ conducted extensive monitoring of ambient water quality parameters within Virginia's surface waters. VDEQ and the Virginia Department of Conservation and Recreation (VDCR) reported the results of this monitoring effort in the *Virginia Water Quality Assessment 1998 305(b) Report* prepared for EPA. The results of this investigation, in conjunction with sampling conducted by VDEQ in January 1999, were used to establish baseline conditions for the streams in the study area.

Flood Insurance Rate Maps (FIRM) produced by the Federal Emergency Management Agency (FEMA) were used to identify the 100-year floodplains as well as other regulatory floodways. The NRCS Soil Survey Reports for Fairfax and Loudoun counties were also used to locate riverine systems.

Wetland systems within the Dulles Corridor were identified prior to field reconnaissance using U.S. Fish and Wildlife Service (USFWS) National Wetland Inventory (NWI) maps and USGS topographic maps. Wetland systems within the study area were delineated between December 2000 and March 2001. Additional delineations were conducted in September 2001 and September 2004 for the Herndon-Monroe park-and-ride facilities, and stormwater management ponds, respectively.

The 1987 Corps of Engineers *Wetland Delineation Manual* was used to determine which areas met the three federal criteria for wetlands: hydrophytic vegetation, hydric soils, and wetland hydrology. Areas that do not meet these properties could also be regulated and include open-water areas, riverine systems, and certain disturbed areas. Areas that hydrologically convey water but do not exhibit all of the necessary parameters to be classified as a wetland could still be part of a wetland system. These areas are typically streams, unvegetated swales, or low areas that have apparent hydrology or hydrologic indicators but have little or no wetland vegetation or may lack hydric soils.

The functions and values of each wetland system were evaluated using *The Highway Methodology Workbook Supplement-Wetland Functions and Values: A Descriptive Approach* (i.e., the New England method). Principal functions and values are defined as an important physical component of a wetland ecosystem (function only), and/or are considered of special value to society from a local, regional, or national perspective. The functions and values defined by this methodology include: groundwater recharge/discharge, floodflow alteration, fish and shellfish habitat, sediment/toxicant/pathogen retention, nutrient removal/retention/transformation, production export, sediment/shoreline stabilization, wildlife habitat, recreation, educational/scientific value, uniqueness/heritage, and visual quality/aesthetics.



4.2.3 EXISTING CONDITIONS

Surface water resources, water quality, wetland systems, floodplains, and critical areas in the study area are discussed below. Groundwater resources are discussed in Section 4.1.

4.2.3.1 Surface Water Resources

The Dulles Corridor is located entirely within the Potomac-Shenandoah River Basin, which is separated into two USGS hydrologic units designated as the Middle Potomac-Catoctin and the Middle Potomac-Anacostia-Occoquan watersheds. A hydrologic unit or watershed is a geographic area representing part or all of a surface drainage basin, a combination of drainage basins, or a distinct hydrologic feature. As shown in Figure 4.2-1, the corridor traverses the drainage divide between the two watersheds, with most

Watershed Boundaries and Streams

Dulles Corridor Rapid Transit Project

of the streams in the Dulles Corridor draining to the Middle Potomac-Catoctin watershed. The Middle Potomac-Anacostia-Occoquan watershed lies within eastern portions of the Dulles Corridor.

Figure 4.2-1 also shows that the Dulles Corridor extends across the upper and middle portions of six smaller watersheds (Pimmit Run, Scotts Run, Difficult Run, Sugarland Run, Horsepen Run, and Broad Run). The smaller first-order streams range in size from two feet to five feet wide with an average channel depth of three feet. Larger second-order streams include Pimmit Run, Scotts Run, Courthouse Spring Branch, Wolftrap Creek, Difficult Run, Sugarland Run, Indian Creek, Horsepen Run, and Broad Run. Where two first-order streams meet, a larger second-order stream is created. The average channel width of these streams is 20 feet with a depth of five feet. Wetland systems associated with these surface waters are described in Section 4.2.3.3. Fairfax County is in the process of developing comprehensive watershed management plans for the county. A watershed management plan is under development for the Difficult Run watershed.

Surface waters identified within the eastern portion of the study area include the main stem of Pimmit Run and several headwater tributaries. These tributaries join the main stem of Pimmit Run in the highly urbanized areas of western Falls Church and Tysons Corner. An increased level of impervious cover resulting from the intense development throughout the Pimmit Run watershed has caused widespread channel degradation. Uncontrolled stormwater runoff from these impervious areas has created downstream scour and channelization of Pimmit Run and its tributaries. Most of the streams in the Pimmit Run watershed have been altered by concrete-lined substrates, which quickly convey stormwater and road runoff to Pimmit Run. Channel incision and/or widening, unstable sediment bars, and bank erosion provide evidence of this alteration. Most riparian buffers (i.e., streambank vegetation) associated with the first-order tributaries in this area have been disrupted or removed. A forested riparian buffer is associated with segments of Pimmit Run downstream of Leesburg Pike, where it provides some bank stability and shade.

The Scotts Run stream system, which flows northeast through the study area, originates in the intensely developed Tysons Corner area. The main stem of Scotts Run and its headwater tributaries drain major urban centers with very high levels of impervious cover. Portions of Scotts Run and most of its tributaries north of the DIAAH and Dulles Toll Road have been diverted through a series of road culverts that have altered stream morphology (form and structure) in the Scotts Run watershed. Over-widening and channelization of the streams near these culverts have caused erosion downstream. The headwater tributaries of Scotts Run are affected by the high percentage of impervious cover as evidenced by bank and channel instability. However, the segment of Scotts Run south of the development along Route 123 flows through a forested stream valley, which has reduced the rate of bank and channel erosion.

Between Tysons Corner and Dulles Airport, the study area bisects several large second-order streams, including Courthouse Spring Branch, Wolftrap Creek, Difficult Run, Sugarland Run and its tributaries, and tributaries to Horsepen Run. Streams in this portion of the alignment are relatively stable throughout their length north and south of the corridor. Most of the stream systems, except Sugarland Run and tributaries to Horsepen Run, are located east of Hunter Mill Road in areas of low-intensity development. Land use in this section of the alignment is composed of established or newly constructed residential areas adjacent to the forested stream valleys of these surface waters. Both Wolftrap Creek and Difficult Run are in stream valleys that have been designated as public parks. The forested riparian buffers of these streams provide bank stability and reduce the rate of erosion associated with channel alteration. However, localized erosion is occurring at the culverts and bridges along the DIAAH and Dulles Toll Road

due to the removal or displacement of the buffer for maintenance of the bridge crossings. The erosion has caused channel widening and increased sediment loads directly upstream and downstream.

The main stem of Sugarland Run and its tributaries, and the contributing surface waters of Horsepen Run are located between the towns of Reston and Herndon. The headwater tributaries of Sugarland Run drain the developed areas of Herndon and flow northeast to join the main stem of Sugarland Run along Fairfax County Parkway. Impervious areas have increased water velocities at the headwaters of these tributaries, thereby altering channel morphology. These tributaries are channelized throughout their lengths until they reach the main stem of Sugarland Run. Sugarland Run has been altered by beaver activity, which has caused several sections of the stream to become filled with sediment. In addition, the riparian buffer of this stream system has been removed to accommodate a commercial complex and overhead power lines.

Two headwater tributaries of Horsepen Run are located on the north and south sides of the DIAAH and Dulles Toll Road. The roadways serve as the drainage divide between the two streams. Both tributaries flow into larger streams that join Horsepen Run west of the DIAAH and Dulles Toll Road/Route 28 interchange. The tributary north of the DIAAH and Dulles Toll Road has been channelized throughout its length and diverted through several in-stream stormwater management ponds. The riparian buffer of the stream has been removed along the corridor and around the stormwater management facilities. The tributary south of the DIAAH and Dulles Toll Road is situated in a forested parcel that provides bank stability and reduces the rate of erosion throughout the channel. The stream is intermittent and conveys overland flow and seasonal base flows to a larger tributary of Horsepen Run.

The main stem of Horsepen Run and its tributaries run northwest through airport property and along the south side of the DIAAH and Dulles Toll Road. The main stem of Horsepen Run is relatively stable throughout its length except where it flows through undersized culverts and where localized erosion and silt deposition occurs. The banks are stabilized with riprap approximately 200 feet upstream of the proposed full LPA alignment to prevent the Dulles Greenway from being undermined by the stream. The forested buffer associated with the stream has been cleared in some areas for maintenance of access roads and property rights-of-way. The tributaries originating within airport property are channelized in their headwaters due to the removal of the buffer to accommodate parking and runway facilities. The buffers are reestablished as the tributaries flow farther north towards their confluence with Horsepen Run. A large tributary, Indian Creek, enters the main stem of Horsepen Run from the north, depositing sand and silt from an extensive beaver complex located upstream of the DIAAH and Dulles Toll Road.

Broad Run, located in Loudon County, is one of the largest second-order streams within the study area. It flows in a northeast direction and has small tributaries entering the main stem both upstream and downstream of the Dulles Greenway. The main stem of Broad Run is stable throughout its length due to a heavily forested riparian buffer and low-density land uses adjacent to the stream. However, removal of the buffer in and around the bridge span for the Dulles Greenway has caused localized erosion to occur, as evidenced by channel widening.

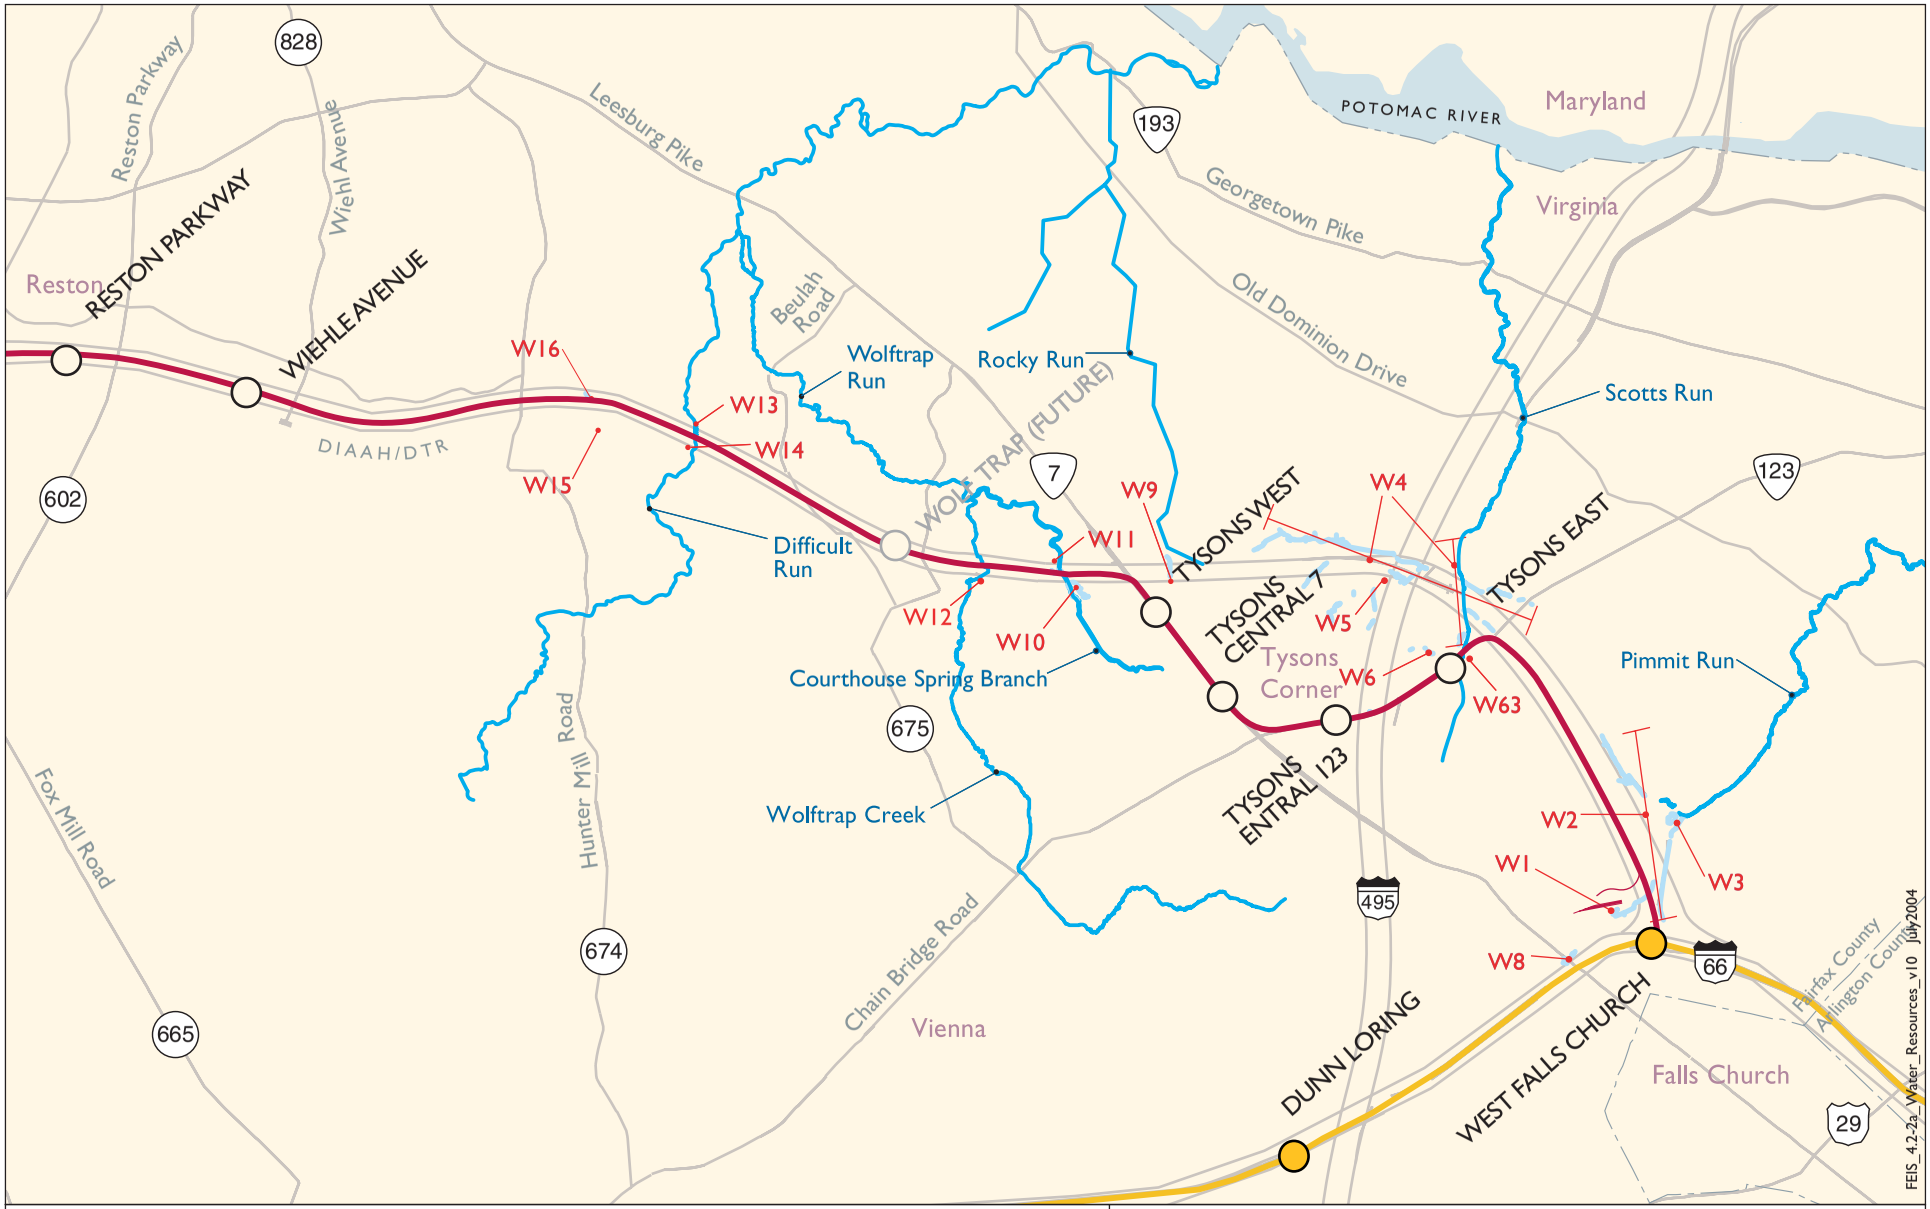
The tributaries entering Broad Run have been converted into ditches to convey surface runoff from adjacent construction sites. Silt and sand have been deposited in the channel substrates of these tributaries from upstream construction, and the stream's forested riparian buffers have been recently cleared for new development.

A tributary north of the Dulles Greenway flows east from the Route 607 interchange to enter the main stem of Broad Run. This stream is experiencing widespread siltation of the channel bed from increasing development within its headwaters and a beaver complex situated near its confluence with Broad Run. The beaver complex has created backwater conditions for most of the channel. A densely forested riparian buffer provides stream bank stability.

4.2.3.2 Surface Water Quality

All of the Commonwealth's surface waters that contribute to the Potomac River and its tributaries are classified according to uses designated by the VDEQ Water Quality Standards. State law dictates that surface waters are to be maintained to protect existing beneficial uses. The designated uses include aquatic life habitat, fishing, shellfish production, swimming, and drinking water. The types of waters that are monitored and evaluated for support of these designations are subdivided into six classes, and standards are applied for ambient water quality. All surface waters identified within the study area are designated as Class III or non-tidal waters.

The assessment of the Commonwealth's water quality is based on the evaluation of both ambient and biological water quality data collected by VDEQ, USGS, VDCR, the Virginia Department of Health, and the Fairfax County Department of Public Works and Environmental Services. The results of VDEQ's ambient water quality parameters monitoring were reported in the *Virginia Water Quality Assessment 1998 305(b) Report*. The results, in conjunction with sampling conducted by VDEQ in January 1999, were used to establish baseline conditions for those streams that bisect the study area. Available data for pH, dissolved oxygen, and temperature from sampling stations near the Dulles Corridor within Pimmit Run, Difficult Run, Sugarland Run, and Horsepen Run indicate compliance with the Commonwealth's water quality standards. These streams and Broad Run have been designated as fully supporting waters of all five designated uses.



Surface waters located in the watersheds of Pimmit Run, Scotts Run, Difficult Run, and Sugarland Run were sampled for fecal coliform levels by the Fairfax County Health Department *(1999 Stream Water Quality Report,* Fairfax County 1999). The samples collected within all of these streams failed to meet the local water quality criteria, with none of the sites averaging under the limit in the past five years. Water quality data were not available for the portions of Broad Run and Horsepen Run located within the study area.

4.2.3.3 Wetland Systems

A total of 49 wetland systems were identified in the study area during field investigations conducted in December 2000 and February 2001. The locations of the wetland systems are shown on Figures 4.2-2a and 4.2-2b and listed in Table 4.2-1. For the purposes of this document, a wetland system may include a single forested, scrub-shrub, or emergent wetland, portions of perennial streams and their tributaries, and a combination of forested, scrub-shrub or emergent wetlands and any hydrologically connected streams and/or tributaries.

A jurisdictional determination by the USACE was issued on March 22, 2002, for most of the wetland systems identified within the project area (Appendix K). Wetlands identified within Dulles Airport property were delineated during the update to Dulles Airport's Master Plan. The jurisdictional determination for the wetlands on Dulles Airport was issued on September 28, 2001 (Appendix K). Jurisdictional determinations are valid for a period of five years, unless new information warrants revisions. As a result of modifications to project design, in August and September of 2004, additional coordination was

Dulles Corridor Rapid Transit Project

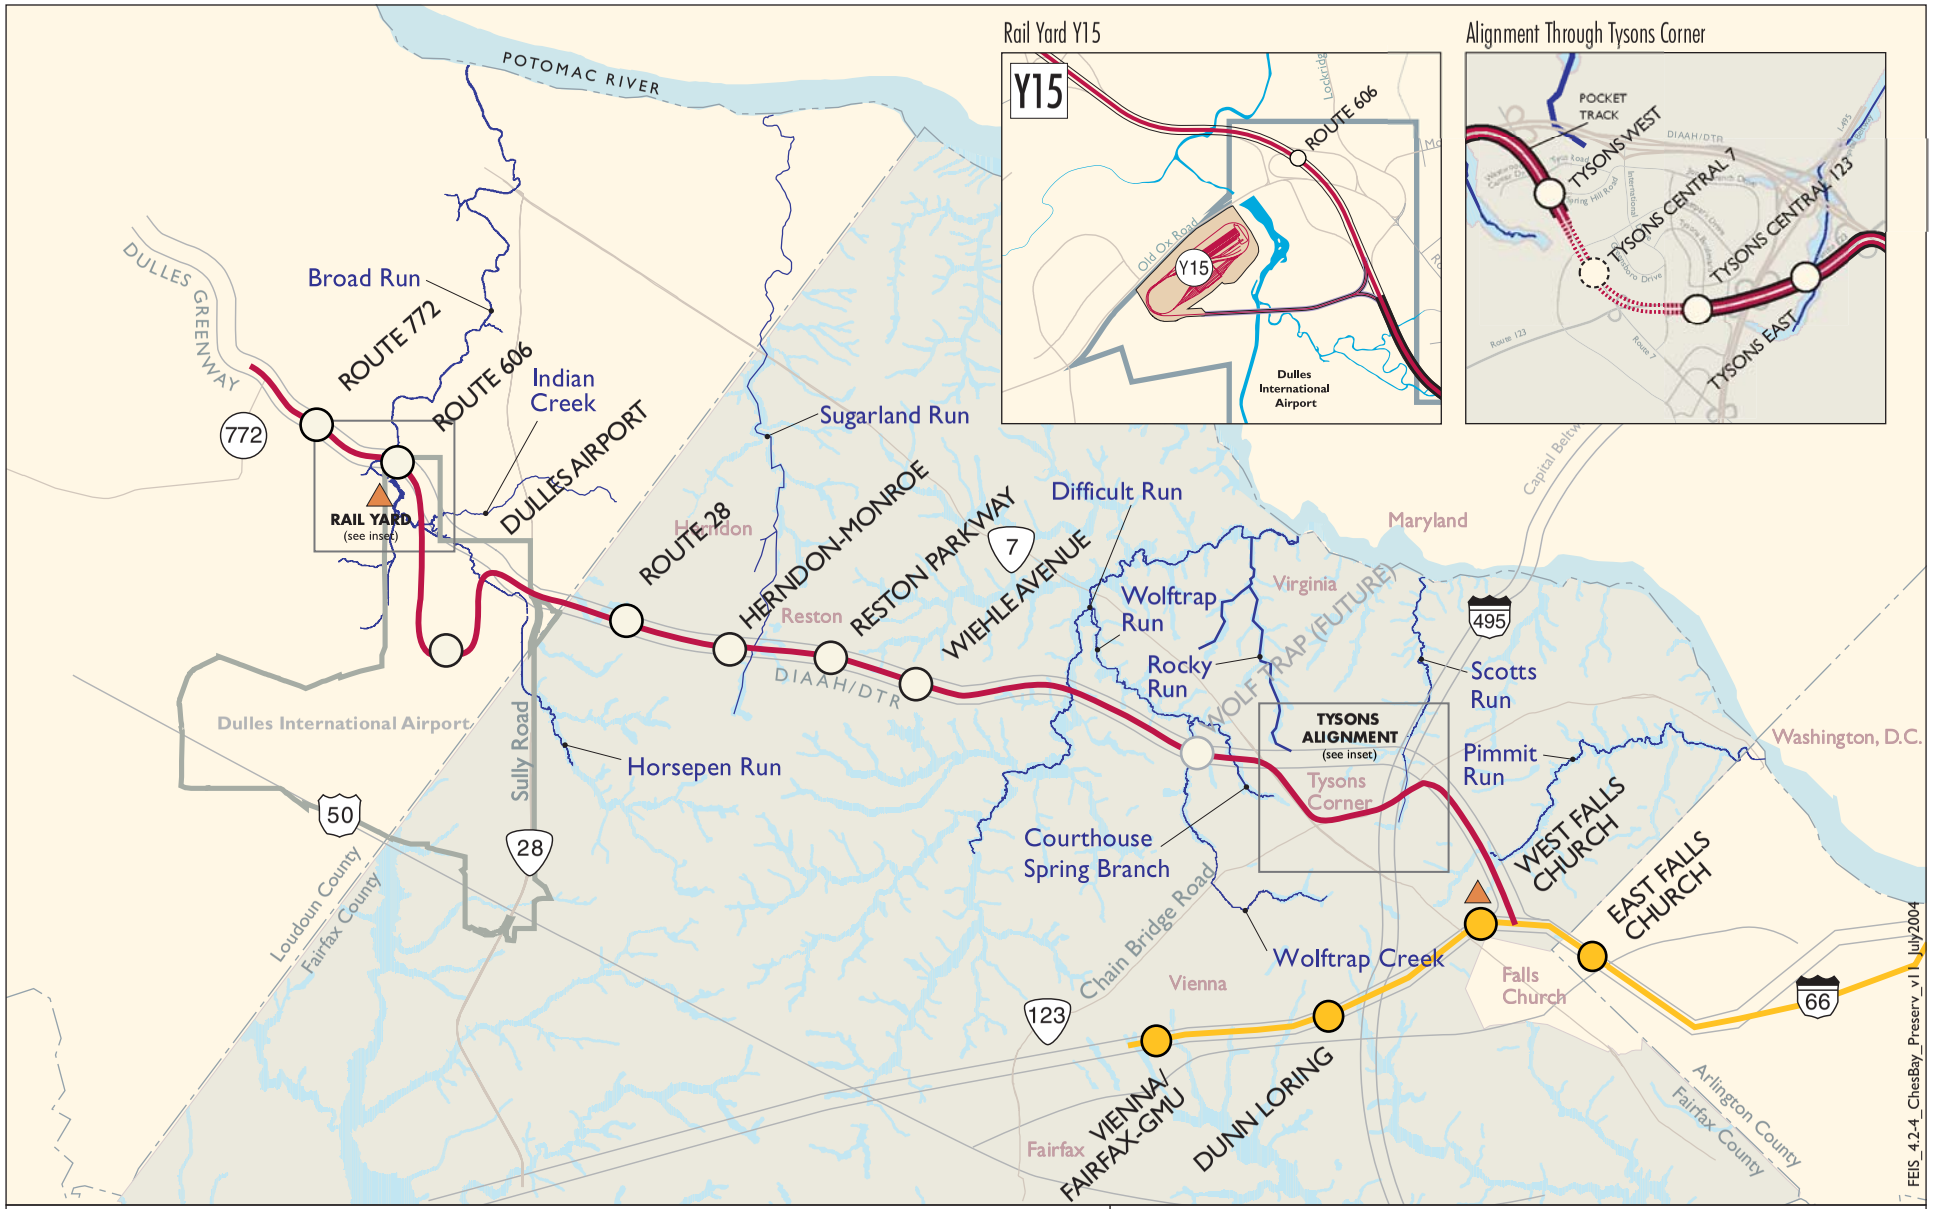
study area, the 100-year floodplains are associated with larger stream systems in both Fairfax and Loudoun counties. These streams include Pimmit Run, Scotts Run, Courthouse Spring Branch, Wolftrap Creek, Difficult Run, Sugarland Run, Indian Creek, Horsepen Run, and Broad Run. Figure 4.2-3 shows the approximate locations of the 100-year floodplains within the study area.

The 100-year floodplains associated with Pimmit Run, Scotts Run, Sugarland Run, and their tributaries are situated in areas of intense development throughout Fairfax County. The encroachment of high-density commercial and residential land uses has reduced the forested component of these floodplains, replacing them with impervious cover or residential lawns. Frequent disruption and alteration of these floodplains occurs near the DIAAH and Dulles Toll Road due to the removal of vegetation for roadway maintenance and the use of concrete to stabilize stream banks.

The 100-year floodplains of Courthouse Spring Branch, Wolftrap Creek, and Difficult Run are surrounded by low-density residential land uses. Most of the forested stream valleys have been retained as public parks or recreation areas in which minimal disturbance is allowed. Vegetation has been removed within the floodplain of Difficult Run near the DIAAH and Dulles Toll Road for roadway and utility maintenance along the bridge span.

The widest 100-year floodplains (1,000 to 3,000 feet wide) within the study area occur along Broad Run, Indian Creek, and Horsepen Run. These floodplains are generally forested upstream and downstream of the study area, with some disturbance occurring near the Dulles Greenway for bridge and road maintenance. Within portions of the Indian Creek floodplain on Dulles Airport property, substantial amounts of vegetation have been removed for the construction of runways, access roads, and maintained ditches. Loudoun County's River and Stream Corridor Overlay District (RSCOD), which includes minor and major floodplains, and Chesapeake Bay Preservation Areas (CBPAs), is discussed in the following section.

4.2.3.5 Critical Areas



Several types of critical areas were investigated to assess whether they are present within the study area: CBPAs, coastal zone, environmental quality corridors (EQCs), RSCODs, impaired streams, wild natural trout streams, wild and scenic rivers, and hazardous wildlife attractants at or near airports.

A. Chesapeake Bay Preservation Areas

As defined in Section 4.2.1, the Chesapeake Bay Preservation Act (amended November 2003) establishes CBPAs in Fairfax County. Figure 4.2-4 depicts Fairfax County's CBPAs, which include Resource Protection Areas (RPAs) and Resources Management Areas (RMAs). The RPAs and RMAs are subject to the criteria and requirements contained in the Chesapeake Bay Preservation Ordinance (Chapter 118 of the Fairfax County Code) including the following:

- No more land shall be disturbed than is necessary to provide for the allowed use, development, or redevelopment;
- Indigenous vegetation shall be preserved to the maximum extent possible;
- Periodic maintenance of Best Management Practices shall be ensured through a maintenance agreement;
- Impervious cover shall be minimized;
- No net increase standard for phosphorus loadings, based on average imperviousness;
- Any land-disturbing activity that exceeds an area of 2,500 square feet shall comply with the sediment and erosion control requirement (Chapter 104 of the Fairfax County Code);

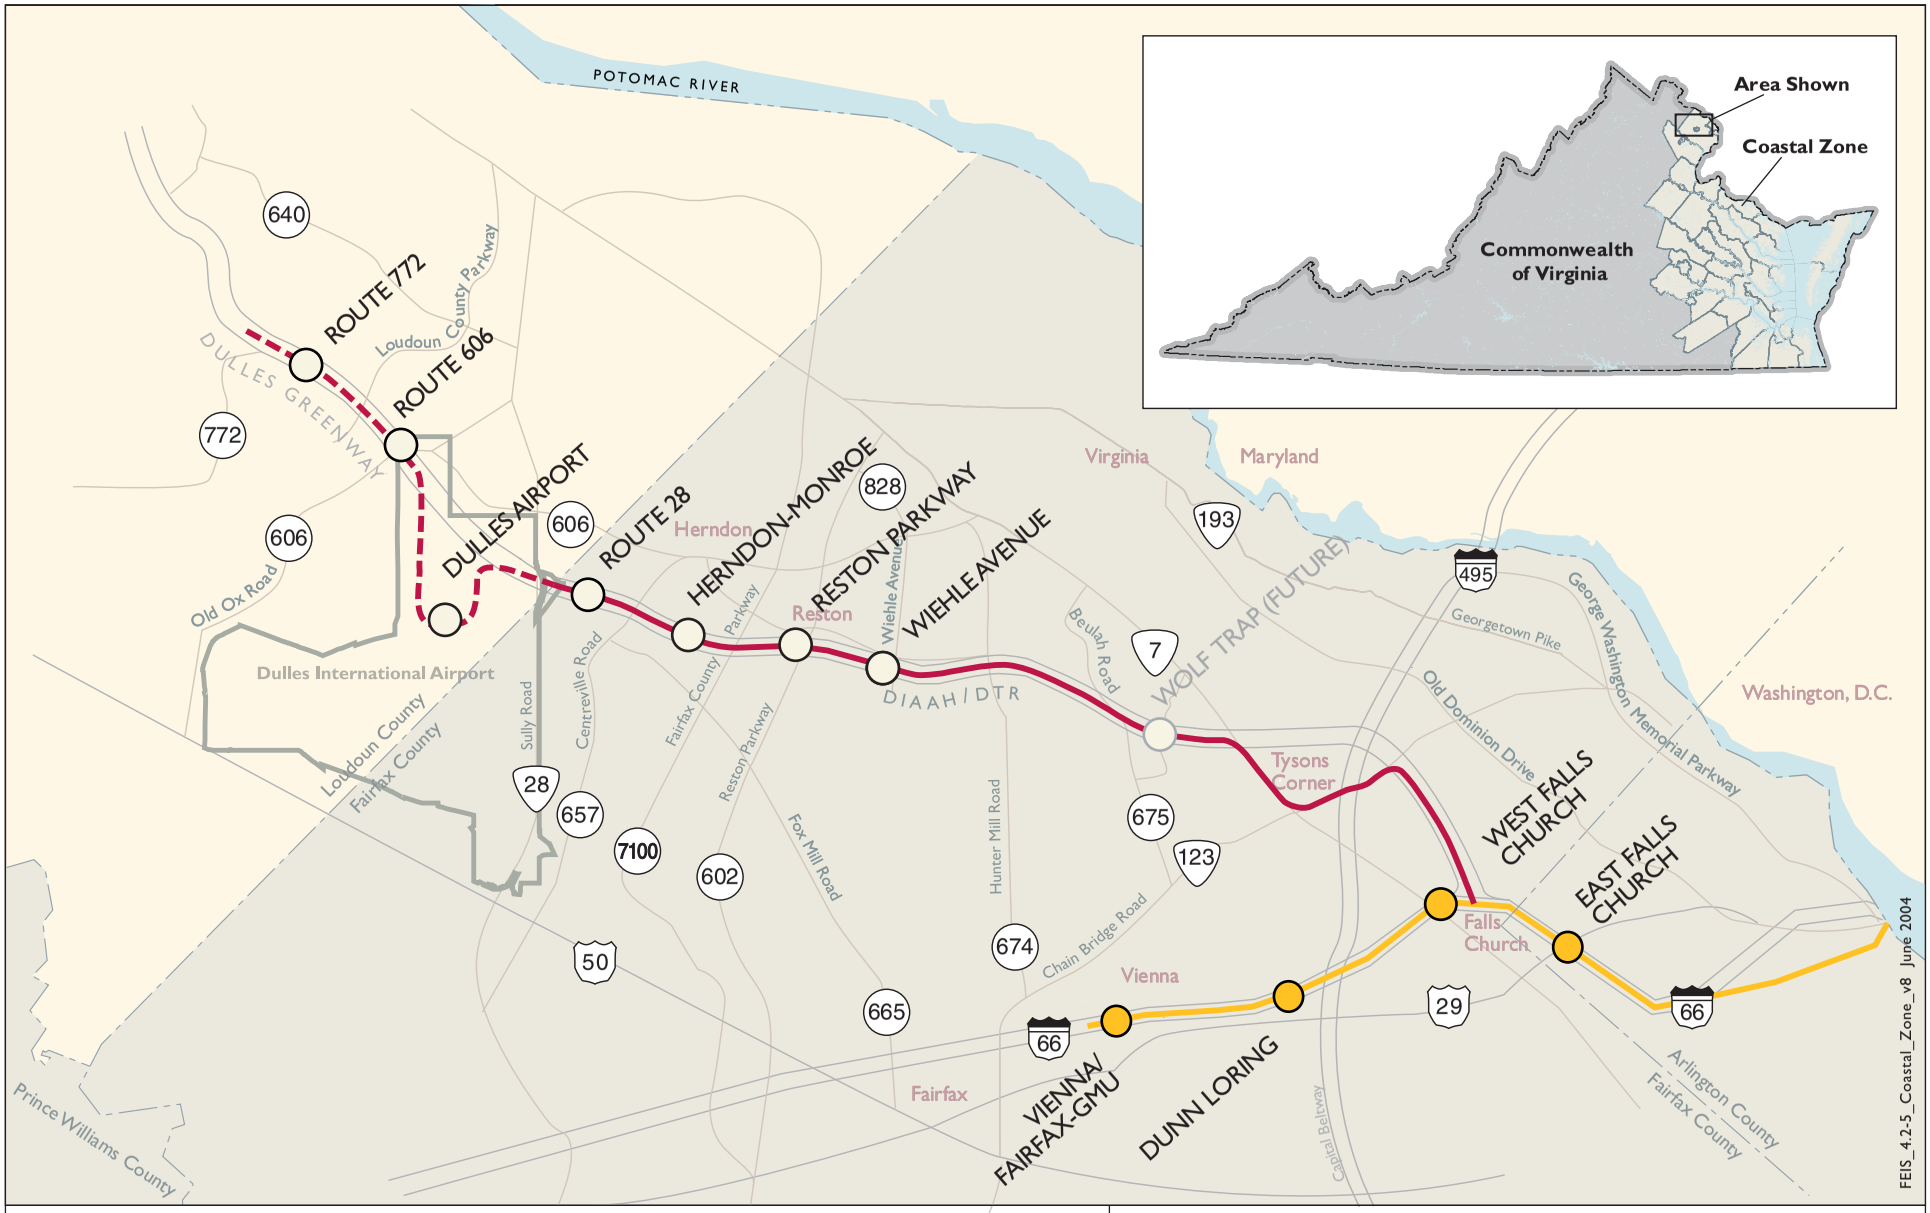
Dulles Corridor Rapid Transit Project

- The Director shall require certification on all plans of development that all wetland permits will be obtained; and
- Stormwater runoff shall be controlled by the use of Best Management Practices contained in the County Code and Public Facilities Manual.

According to Fairfax County, areas designated as RPAs extend around all water bodies with perennial flow including Pimmit Run, Scotts Run, Difficult Run, Surgarland Run, and other perennial water bodies within the study area. The limits of the RPAs include a 100-foot-wide buffer on either side of these streams. Where wetlands are contiguous and connected by surface flow to tributary streams, a 100-foot buffer would be measured from the boundary of the wetland. In addition, the land within a major floodplain is considered a buffer area. The extent of the RMAs covers all areas in Fairfax County outside of the RPAs.

The construction of railroads and public roads is exempt from the Chesapeake Bay Preservation Act to the extent that the construction is allowed by the Zoning Ordinance and complies with the Erosion and Sediment Control Law (Section 10.1-560 of the Code of Virginia), Chapter 104 of the Fairfax County Code, and with the Stormwater Management Act (Section 10.1-603.1 of the Code of Virginia).

B. Coastal Zone



The coastal zone in the Commonwealth of Virginia encompasses 29 counties, 17 cities, and 42 incorporated towns all located in what is considered "Tidewater Virginia." Within the study area, only Fairfax County lies within the coastal zone. Figure 4.2-5 depicts the coastal zone. The Virginia Coastal Resources Management Program was established in 1986 to protect and manage the zone. The Virginia Coastal Resources Management Program is networked with several agencies administering the enforceable policies. The VDEQ, as the lead agency for Virginia's coastal program, is responsible for coordinating the Commonwealth's review of federal consistency determinations and helps agencies and localities develop and implement coordinated coastal policies. A federal Coastal Zone Management Act consistency determination for the Full LPA was issued by VDEQ in October 2004 (Appendix L).

C. Environmental Quality Corridors

Fairfax County's EQC system is based on the protection of the County's stream valleys. Efforts to minimize adverse impacts of land use and development on the County's streams are pursued under the Comprehensive Plan. The stream valley component of the EQC system includes the following elements: all 100-year floodplains as defined by the zoning ordinance; all areas of 15 percent or greater slopes adjacent to the floodplain, or if no floodplain is present, 15 percent or greater slopes that begin with 50 feet of the stream channel; all wetlands connected to the stream valleys; and all the land within a corridor defined by a boundary line which is 50 feet plus four additional feet for each percentage slope measured perpendicular to the stream bank.

The EQC designation, as policy guidance of the Comprehensive Plan, accomplishes voluntary preservation of stream valleys and associated environmentally sensitive features during the zoning process. EQC designations and boundaries are determined during the zoning process (the review of re-zonings, special exceptions, special permits, variances, and related development applications) through the application of criteria in the Comprehensive Plan. Development is controlled within the EQC only when such land is acquired by the County, when commitments are made by land owners and developers, when conditions are imposed through the zoning process, or when EQC areas also lie within regulated areas (e.g., Resource Protection Areas; floodplains).

Dulles Corridor Rapid Transit Project

D. River and Stream Corridor Overlay District

The *Loudoun County Revised General Plan* identifies stream corridors as important in filtering out impurities in surface runoff moving toward a stream, as wildlife corridors, and in the preservation of valuable historic, archaeological, and scenic features. Figure 4.2-6 shows the River and Stream Corridor Overlay District (RSCOD) in Loudoun County. Loudoun County defines the RSCOD as containing the following:

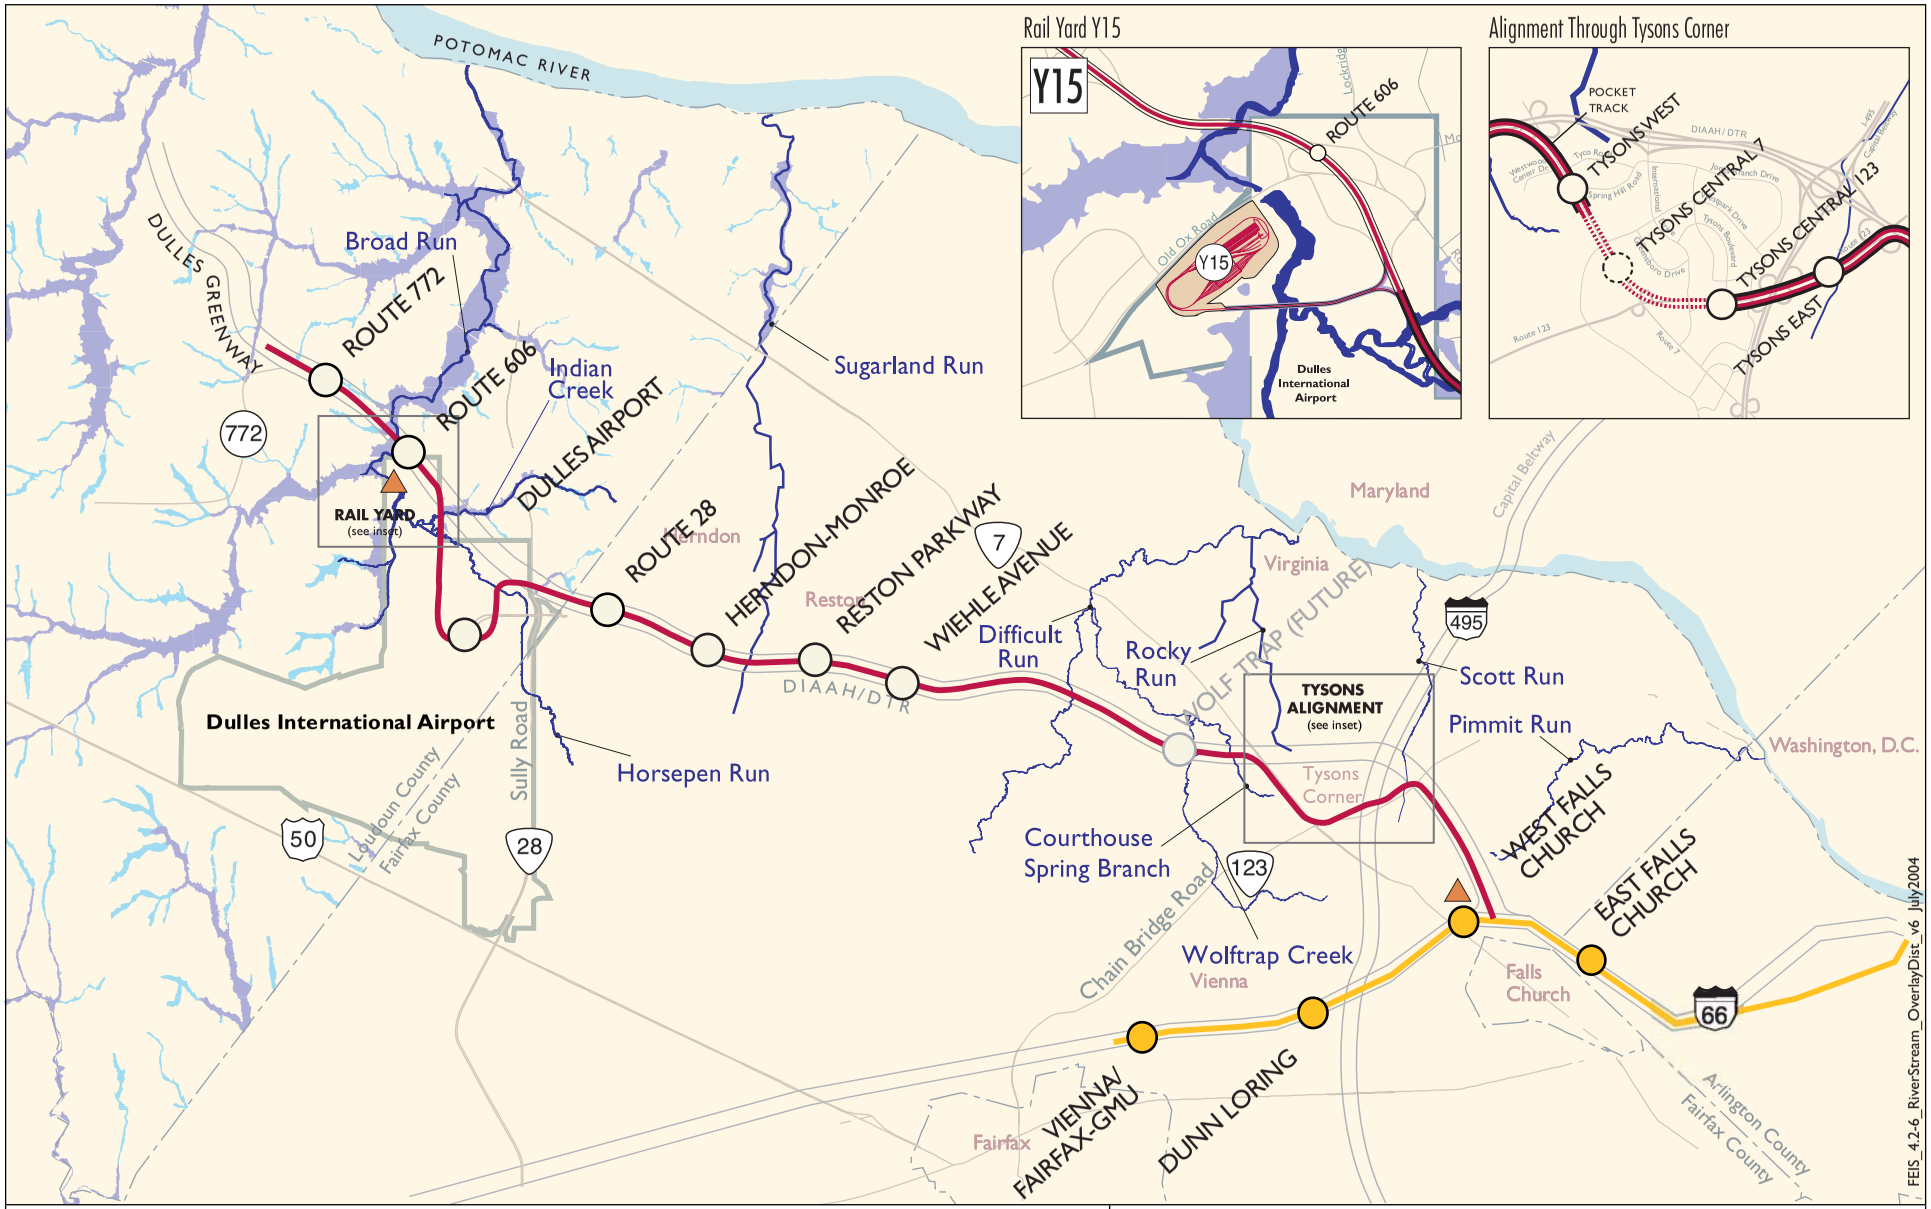
- Rivers and streams draining 100 acres or more;
- 100-year floodplains;
- Adjacent steep slopes (slopes of 25% or greater), starting within 50 feet of streams and floodplains, extending no farther than 100 feet beyond the originating stream or floodplain;
- Adjacent management buffers that extend for 50 feet around surrounding floodplains and adjacent steep slopes; and
- Wetlands, riparian forests, and historic and archaeological sites that fall within the above elements.

A 100-foot minimum stream buffer protects rivers and streams when the 100-year floodplain and adjacent steep slope areas do not extend beyond either bank by 100 feet, and is considered part of the RSCOD. Under certain circumstances, the 50-foot management buffer could be reduced or eliminated by Loudoun County.

Loudoun County allows development and uses in the RSCOD that support or enhance the biological integrity and health of the river and stream corridor. Permitted uses are required to have minimal adverse effects on wildlife, aquatic life, and their habitats (riparian forests, wetlands, and historic and archaeological sites) and complement or enhance the hydrologic processes of the river and stream corridors including flood protection and water quality. Development within the RSCOD is limited to open space and recreational uses that are water-dependent: public water bodies; greenways and trails; historic and archaeological sites; stormwater management facilities; and agricultural and silviculture activities. Utilities and road crossings, rail crossings, bridges, and driveway crossings are allowed only when the environmental objectives of the RSCOD can be maintained or enhanced. The county also encourages land within stream corridors to be placed in permanent protective conservation easements.

E. Impaired Streams

According to the 1998 *303(d) Total Maximum Daily Load Priority List and Report*, Difficult Run is listed as an impaired stream from its confluence with Captain Hickory Run downstream to its confluence with the Potomac River. This section of Difficult Run is located several miles downstream of the study area. No other streams that bisect the study area are listed as impaired by VDEQ.



F. Wild Natural Trout Streams

The Virginia Department of Game and Inland Fisheries (VDGIF) has established a classification system for trout waters based on aesthetics, productivity, resident fish population, and stream structure. There are no surface waters in the study area that are designated as wild natural trout streams.

G. Wild and Scenic Rivers

There are no federal Wild and Scenic Rivers or State Scenic Rivers in or near the study area.

H. Hazardous Wildlife Attractants At or Near Airports

The FAA may review development and/or mitigation plans within five statute miles of an airport's aircraft movement areas, loading ramps, or aircraft parking areas to determine if such changes present potential wildlife hazards to aircraft operations. According to FAA Advisory Circular No. 150/5200-33, all species of wildlife can pose a threat to aircraft safety. However, some species are more commonly involved in aircraft strikes, such as gulls, waterfowl, raptors, doves, vultures, blackbirds, starlings, corvids (i.e., crows and ravens), wading birds, deer, and canids (i.e., wolves, foxes, coyote). The habitats for these species are mainly wetland areas that could be hazardous wildlife attractants. Based on the FAA circular, relocated wetlands, relocated and new stormwater management ponds, and similar alterations to wetlands as defined above, within up to 10,000 feet of an airport, must be assessed for their ability to increase hazardous wildlife.

4.2.4 LONG-TERM EFFECTS

The long-term effects to water resources from the proposed implementation of the No Build Alternative and the full LPA are discussed below. Long-term effects are those that would permanently alter the hydrology and function of the water resource. For example, excavating a floodplain would permanently alter its ability to attenuate floodwater; filling a wetland would permanently alter its hydrology and its ability to function as a wetland. Furthermore, failure to control stormwater and sediments from a construction site could permanently affect water quality and function of a water resource.

In compliance with Federal and state regulations, efforts were made to avoid impacts to wetland systems and floodplains. In several cases, station facilities and/or the alignment were shifted to avoid or minimize their effect on several wetlands and/or floodplains. In areas where impacts are unavoidable, appropriate and practicable compensatory mitigation would be implemented.

The following resources and designations do not occur in the Dulles Corridor and are not discussed below: wild natural trout streams, wild and scenic rivers, and state scenic rivers.

A summary of the effects of the No Build Alternative, the Wiehle Avenue Extension, and the full LPA on water resources is presented in Table 4.2-2.

Table 4.2-2: Effects to Water Resources

Water Resource	No Build Alternative (2025)	Locally Preferred Alternative		
		Wiehle Avenue Extension Opening Year (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Pimmit Run (W-2)	None	Proximity[4] Floodplain[5] CBPA[6] Water Quality[6]	Proximity[4] Floodplain[5] CBPA[6] Water Quality[6]	Proximity[4] Floodplain[5] CBPA[6] Water Quality[6]

Water Resource	No Build Alternative (2025)	Locally Preferred Alternative		
		Wiehle Avenue Extension Opening Year (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
W-50	None	None	None	Wetland Impact (0. 1 acre) Stream Impact (25 linear feet) RSCOD[4]
W-51	None	None	None	Wetland Impact (0.2 acre) Stream Impact (220 linear feet) RSCOD[4]

CBPA – Chesapeake Bay Preservation Areas

EQC – Environmental Quality Corridors (previously designated by Fairfax County)

RSCOD – River and Stream Corridor Overlay District

1. Proximity to construction could alter the hydrology and/or function of water resources.
2. Potential effect to 100-Year Floodplain. However, no increase in floodplain elevation of more than one foot is anticipated.
3. Minimal effects, use of Best Management Practices assumed/required. Construction of a railroad and associated facilities is exempt from the Chesapeake Bay Preservation Ordinance when construction complies with County and State codes for stormwater and sediment/erosion control.
4. Minimal effect, use of Best Management Practices assumed/required. Rail and road crossings are allowed when RSCOD environmental objectives can be maintained or enhanced.
5. Permanent and temporary impacts due to the vegetative class change from forested to emergent wetland after bridge construction.

4.2.4.1 No Build Alternative

Under the No Build Alternative, there would be no effects to water resources from the Dulles Corridor Rapid Transit Project. However, effects from improvements assumed under this alternative could occur and are the responsibility of the agencies and jurisdictions implementing the improvements.

4.2.4.2 Wiehle Avenue Extension

The Wiehle Avenue Extension crosses seven surface waters: an unnamed tributary to Pimmit Run (W-2), Pimmit Run, Scotts Run, Courthouse Spring Branch, Wolftrap Run, Difficult Run and an intermittent stream (W-15). Four wetland systems would be affected by the Wiehle Avenue Extension: W-2, W-4, W-13 and W-16. Impacts to these resources and affiliated floodplains and critical areas are discussed below.

The location of stormwater management P-6 was previously identified as having a potential wetland impact. In order to avoid this impact, the pond was shifted to be outside the wetland area.

North of the Dulles Connector Road and I-66 interchange, the alignment would cross an unnamed perennial stream (part of W-2) that is piped under the Dulles Connector Road to join a concrete-lined tributary to Pimmit Run. The proposed the Wiehle Avenue Extension alignment would use the existing stormwater management facilities along the Dulles Connector Road. Because the stream has already been piped under the existing roadway, it is not anticipated that the construction and operation of the Wiehle Avenue Extension would permanently affect the hydrology or function of the stream.

The Wiehle Avenue Extension alignment would also cross Pimmit Run. A new bridge structure would be added within the median of the Dulles Connector Road to span the stream. Piers would be placed within the 100-year floodplain of the stream to support this new bridge section. The new bridge piers would be placed parallel to existing highway bridge piers and would have minor effects on the floodplain. The new

bridges are not anticipated to constrict the channel's water flow or change the 100-year floodplain surface elevation. On-site flooding would not affect the proposed bridge structure, which would be located well above the floodplain elevation. Additionally, off-site flooding risks would not change because there would be no change in floodplain elevation.

Piers for the bridge extension over Pimmit Run would also be placed within the RPA of the stream. Despite the permanent pier structures, no further disturbance to the RPA is anticipated because most of the area near the proposed bridge spans has already been cleared and graded to support existing bridge structures. Water quality in Pimmit Run would not be substantially altered because of the limited amount of new impervious surface area added and pollution constituents that could enter Pimmit Run. Coordination will continue with Fairfax County to determine if this water resource would be designated as an EQC. If such designation occurs, appropriate Best Management Practices would be employed to avoid or minimize impacts.

Tie breaker station 2 (B-2) would be located on the north side of the Dulles Toll Road, just north of its crossing of Pimmit Run. B-2 is located near a concrete-lined flume that directs road runoff to Pimmit Run. Due to the existing conditions and the fact that the tie breaker station would not be a source of excessive runoff or pollutants, no long-term effects on the water quality or the existing hydrology of this feature or Pimmit Run are expected.

The Wiehle Avenue Extension alignment would also be located partially within the RPA of the unnamed perennial stream piped under the Dulles Connector Road that joins a concrete-lined tributary to Pimmit Run. The RPA extends along the Dulles Connector Road until Idylwood Road. However, because the Wiehle Avenue Extension alignment would be in the median of the existing roadway and would not disrupt the hydrology or function of this stream, long-term effects to the RPA are not anticipated. Because only minimal changes would occur within the designated CBPA and RPA for Pimmit Run, these critical areas would not be affected.

Proposed Tysons East Station facilities would be adjacent to Scotts Run, a designated CBPA and EQC by Fairfax County. The Tysons East Station would be an aerial station spanning the stream. Piers to accommodate the station and facilities would be located outside of Scotts Run, but within the 100-year floodplain and the RPA for the stream. To avoid long-term effects to water quality and reduce existing nonpoint source pollution in the area, Best Management Practices would be implemented including the construction of a stormwater management pond in the southwest corner of the site. The site would be designed such that runoff would flow into the pond during and after construction. Additionally, the quantity of water would be appropriately maintained. Therefore, minimal long-term effects to this surface water resource and water quality are anticipated.

The floodplain of Scotts Run would not be affected by the placement of piers for the bridge structure. The new piers would be parallel with existing bridge piers and they are not anticipated to constrict the channel's water flow. No change in the 100-year floodplain surface elevation is anticipated. On-site flooding would not affect the proposed bridge structure, and off-site flooding risk would not change. Therefore, the CBPA and EQC designations associated with Scotts Run would not be substantially affected. At the Tysons East Station, the facilities would shade a portion of a perennial stream (W-63), which would have a minimal effect on the stream. This stream drains to Scotts Run.

Several second-order streams, including Courthouse Spring Branch, Wolftrap Creek and Difficult Run, would be crossed by the alignment of the Wiehle Avenue Extension. Most of these streams, with the exception of Difficult Run, have been channeled under the DIAAH.

At the Difficult Run crossing, a concrete section would be added to span the gap between the existing DIAAH and the Dulles Toll Road bridge lanes over the stream. Piers would be placed within the 100-year floodplain of Difficult Run. However, the floodplain would not be affected by the placement of these piers, because they would be parallel to the existing piers. The bridge structures are not anticipated to constrict the channel, or change the 100-year floodplain surface elevation. The proposed bridge structure, which would be located well above the floodplain elevation, would not affect on-site flooding. Off-site flooding risk would not change either because no change in floodplain elevation would be associated with the bridge piers. For these same reasons, it is anticipated that the new bridge crossings would result in minimal long-term effects to the RPA and floodplain of Difficult Run. Coordination will continue with Fairfax County to determine if this water resource would be designated as an EQC. If such designation occurs, appropriate Best Management Practices would be employed to avoid or minimize impacts.

Water quality in Difficult Run, one of the two streams that are monitored by VDEQ within the study area, would be minimally affected because of the limited amount of new impervious surface and pollution constituents that would enter these streams. However, the proposed stormwater management facilities at the Tysons West Station would improve downstream water quality in Difficult Run by controlling nonpoint source pollution originating in Tysons Corner.

The Wiehle Avenue Extension would cross the 100-year floodplain and the RPAs of Courthouse Spring Branch and Wolftrap Creek. Because the floodplains of those streams are contained within the concrete-lined channels at the location of the proposed bridge structures, and because the piers of these bridges would not be placed within the channels, no impacts to the floodplains associated with these waters would occur.

A proposed stormwater management pond would be located immediately west of W-16. Long-term effects to W-16 are not anticipated. Best Management Practices, as described in the *Virginia Erosion and Sediment Control Handbook* would be used to prevent long-term effects, such as bank failure.

4.2.4.3 Full LPA

In addition to the effects discussed for the Wiehle Avenue Extension, the full LPA would cross two additional surface waters, Horsepen Run and Broad Run. Proximity of the Herndon-Monroe station would have minor effects on Sugarland Run. Fourteen additional wetland systems would be affected by the full LPA: W-18, W-60, W-80, W-FB/FBA/F, W-RIS (in two separate areas of this large system), W-26, W-50, W-51, W-RISA, W-MMMA, W-MMMB, W-MMMC1/MMMD, and W-MMMG. Impacts to these resources and affiliated floodplains and critical areas are discussed below.

As design of the project has progressed, planning for stormwater management has resulted in confirmation of the need for a stormwater management pond in the vicinity of an existing stormwater management facility that has established hydrophytic vegetation. As a result, stormwater management pond P-15 has been identified as having a wetland impact of 0.3 acre.

Sugarland Run is in the vicinity of the Herndon-Monroe facility. The full LPA would not cross this resource but would have minor impacts on the water quality of this stream because of the limited amount of new impervious surface resulting in runoff and pollutants that would enter these streams. Sugarland Run is one of two streams that are monitored by VDEQ within the study area.

The full LPA would cross the 100-year floodplain and the RPA associated with Sugarland Run. No long-term effects to these resources are expected because the full LPA would span the floodplain. In addition, piers associated with the bridge structures would not be located within the channel of the stream.

Another stormwater management pond would be located on a drainage ditch near the Dulles Toll Road ramp at Fairfax County Parkway. Stormwater from the drainage ditch is currently conveyed via a concrete-lined channel (W-18). Due to the existing conditions of W-18, impacts are expected to be minimal. It is likely that the stormwater facility would help to reduce sediment loads and control surges in water flow to W-18.

The southwest corner of the proposed west parking facility for the Herndon-Monroe Station would permanently affect 0.1 acre of an emergent wetland (W-80). Appropriate Best Management Practices would be used during construction to avoid additional long-term impacts to the entire wetland system.

The potential parking structure to the west of the existing structure at the proposed Herndon-Monroe Station would be located on a temporary conservation easement. The plat map shows a temporary conservation easement through Parcel 27, property of Fairfax County Board of Supervisors, Hunter Mill District, Fairfax County, Virginia. The area is described as a temporary conservation easement that shall remain valid until such time as property is developed with adequate stormwater management and Best Management Practices. The proposed west structure would cover a very small area of the easement. Adequate stormwater management facilities would be installed and appropriate Best Management Practices would be used during construction and operation of the facility.

The south entrance/exit to the south structure at Route 28 Station would permanently affect 0.1 acre of a forested wetland (W-60). Initially, the parking facility affected more of the wetland, but the facility was reconfigured to minimize wetland impacts. The hydrology of the wetland system would not be affected because a structure proposed under the entrance/exit would allow for the flow of water. An EQC associated with W-61 could be affected by the aerial pedestrian walkway to the north structure at Route 28 Station.

The crossing of the Horsepen Run stream corridor occurs within a designated RSCOD; however, no permanent impacts to the RSCOD are expected. The crossing would use established Best Management Practices to maintain and enhance the environmental objectives of the RSCOD.

The floodplain of Horsepen Run would not be affected by the placement of new piers for the bridge structure. The new piers would be parallel with the piers of the existing bridges. The bridge structure is not anticipated to constrict the channel, or change the 100-year floodplain surface elevation. On-site flooding would not affect the proposed bridge structure, which would be located well above the floodplain elevation. Off-site flooding risk would not change because there would be no change in floodplain elevation associated with the bridge piers.

As the full LPA alignment exits the western side of Dulles Airport property, the proposed aerial structure from Autopilot Drive to the median of the Dulles Greenway would affect approximately 0.4 acre of W-FB/FBA/FF and 0.2 acre of forested wetland W-RIS. Since emergent wetlands would re-establish under the bridge, the impact is considered a permanent change in vegetative classification. Additionally, the full LPA would span Horsepen Run and the associated RSCOD again. Piers to support the alignment would be placed within the forested wetlands, the 100-year floodplain, and the RSCOD for Horsepen Run (W-26). However, the piers would be designed and placed in compliance with all applicable local, state and federal regulations pertaining to wetlands and floodplain involvement. It is not anticipated that there

would be any changes in floodplain surface elevations. Therefore, the full LPA would not affect the 100-year floodplain associated with Horsepen Run. A rail crossing would be allowed within the RSCOD for Horsepen Run when the environmental objectives of the RSCOD can be maintained or enhanced. Mitigation measures are discussed in Section 4.2.7.

Piers for the bridge extension over Broad Run would be placed within the 100-year floodplain. Despite the permanent pier structures, no further disturbance to the floodplain is anticipated because most of the area near the proposed bridge spans has already been cleared and graded to support existing bridge structures. Water quality in Broad Run would not be substantially altered because of the limited amount of new impervious surface area and pollution constituents that could enter Broad Run. No long-term effects are expected to the Broad Run RSCOD designation. The crossing would use established Best Management Practices to maintain and enhance the environmental objectives of the RSCOD.

The facilities associated with the Route 606 Station, as proposed, encroach upon a small portion of the FEMA-designated and Loudoun County major floodplains of Broad Run.

The Route 772 Station facilities on the north side of the Dulles Greenway would directly affect 0.2 acre of a palustrine forested wetland (W-51) and 220 linear feet of an associated tributary to Broad Run. A road leading to substation TP-15 would affect 0.1 acre of a palustrine emergent wetland and 25 linear feet of an associated intermittent tributary to Broad Run (W-50). The stream would be piped under the road.

Where the yard lead enters S&I Yard Site 15, approximately 0.1 acre of forested wetland W-RISA and 3.1 acres of forested wetland W-RIS would be affected. Impacts to W-RISA and W-RIS would be considered permanent changes in the vegetative classification from forested to emergent wetlands. S&I Yard Site 15 and its yard lead would also affect a small portion of the 100-year floodplain of Horsepen Run associated with W-RIS as well as cross the RSCOD of Stallion Branch associated with W-RIS. Piers would be placed on the banks of the stream, within the forested 100-year floodplain of Horsepen Run so that the full LPA would span the stream and minimize impacts. In addition to spanning the streams, Best Management Practices would also be used to minimize disturbance of the streams, W-RIS, and the RSCOD.

Wetlands W-MMMA (0.1 acre) and W-MMMB (0.1 acre), located at the northwest portion of the yard, would be affected by the proposed parking area. Additionally, a portion of Wetland W-MMMC1/MMMD (0.2 acre) and W-MMMG (0.2 acre) would be affected by the S&I Yard Site 15.

4.2.5 CONSTRUCTION EFFECTS

The short-term construction effects of implementing the No Build Alternative, the Wiehle Avenue Extension, and the full LPA are discussed below.

4.2.5.1 No Build Alternative

Under the No Build Alternative, there would be no construction-related effects to water resources from the Dulles Corridor Rapid Transit Project. However, there could be construction-related effects from the improvements assumed under this alternative. Identification of those effects is the responsibility of the agencies and jurisdictions implementing the improvements.

4.2.5.2 Wiehle Avenue Extension

Construction-related effects would result from land disturbing activities that may temporarily contribute to surface water quality impacts. Best Management Practices, as outlined in the guidance, policies, standards, and specifications contained in the *Public Facilities Manual* (2001), *Virginia Erosions and Sediment Control Handbook* (1992), *Northern Virginia Best Management Practices Handbook* (1992), *Best Management Practoces Maintenance in the Occoquan Watershed* (1992), *Chapter 104 (Erosion and Sediment Control) of Fairfax County Code* (amended 2003), and all other applicable requirements/guidance, would be used to minimize construction-related impacts to these resources.

4.2.5.3 Full LPA

Construction-related impacts would be similar to those described for the Wiehle Avenue Extension, with the exception of an aerial structure that would be constructed in the vicinity of Autopilot Drive. As the full LPA exits the Dulles Airport from Autopilot Drive to the median of the Dulles Greenway, an aerial structure would be constructed over forested wetlands W-FB/FBA/F (0.4 acre) and W-RIS (0.2 acre) causing a change in the vegetative class from forest to emergent. In addition to the permanent impacts identified with this structure, bridge construction would temporarily affect the emergent wetland that would re-establish after construction is complete. In a similar circumstance, the Site 15 yard lead would be constructed over forested wetland W-RIS causing a permanent impact to the forested wetland and a temporary impact to the emergent wetland that would re-establish after construction is complete.

Wetland System W-60 would be temporarily affected by restricting surface water flow while a structure is constructed under the entrance/exit of the proposed Route 28 Station. Wetland System W-50 would be temporarily affected by restricting surface flow while an access road to an ancillary facility is being constructed.

The wetland system associated with P-15 (0.3 acre) would be temporarily impacted during construction of the planned stormwater management pond. It is expected that the wetland would reestablish over time after construction is completed. Impacts would be mitigated as described in Table 4.2-3.

4.2.6 MITIGATION

This section describes the mitigation measures for long-term effects on surface waters, wetlands, floodplains, critical areas, and hazardous wildlife attractants (at or near Dulles Airport).

4.2.6.1 Surface Waters and Water Quality

Bridges that span a stream or tributary and concrete-lined streams that are converted to pipe(s) would not require mitigation. For the two natural streams converted to culvert or pipe, Tributaries W-50 and W-51, DRPT would plant riparian buffers near affected areas. Once the project is operational, Best Management Practices would be used to minimize impacts to groundwater resources.

During construction, DRPT would develop a Stormwater Management Plan and comply with applicable federal, state regulations and local ordinances. In addition, the project team would follow Best Management Practices in the *Virginia Erosion and Sediment Control Handbook*, the *Northern Virginia Best Management Practices Handbook*, and the *Public Facilities Manual for Stormwater Management and Groundwater Protection*.

4.2.6.2 Wetland Systems

Section 404 of the Clean Water Act provides regulatory authority to the USACE to issue or deny permits for the discharge of dredged or fill material into waters of the United States, including special aquatic sites (e.g., wetlands, mud flats, riffle pool complexes, and vegetated shallows). Appropriate and practicable compensatory mitigation is required for unavoidable adverse impacts to aquatic resources. In determining compensatory mitigation, the functional values lost by the affected resource must be considered in developing the goals of the mitigation plan. U.S. DOT Order 5660.1A requires transportation facilities and projects to assure the protection, preservation, and enhancement of the nation's wetlands to the fullest extent practicable during the planning, construction, and operations.

Coordination with the USACE, VDEQ and EPA has been conducted to identify Waters of the United States, determine the extent of impact to those resources, and to determine appropriate mitigation for impacts. Wetland impacts have been avoided and minimized to the extent possible by placing the majority of the alignment within existing transportation rights-of-way and traversing wetland areas on structure as opposed to fill where possible to reduce potential impacts. For unavoidable impacts, appropriate mitigation will be provided for jurisdictional wetlands regulated under Section 404 of the Clean Water Act (33 U.S.C. 1344).

The majority of wetland impacts are associated with S&I Yard 15, located on Dulles Airport property. Alternative sites for Metrorail Storage and Inspection were evaluated to avoid and minimize impacts to wetlands. Most of these sites were eliminated due to potential extensive impacts, such as floodplain involvement, wetlands, property acquisition, including a historic resource, and physical constraints, such as steep slopes, of the sites. Later it was recommended that the initial site chosen and carried forward during the alternatives analysis be reconsidered. Several other sites were evaluated and later determined to also have extensive environmental constraints, inconsistencies with land use plans and operational constraints. As a result of the Draft EIS technical analysis, public comment, and agency coordination S&I Yard 15 was ultimately selected as the preferred site. The potential impacts to wetlands associated with this site (3.8 acres) have been minimized through design of the facility to avoid adjacent wetland areas through horizontal relocation of facilities and by use of aerial structure to span wetlands instead of requiring placement of fill in wetlands.

The USACE issued a jurisdictional determination delineating the waters of the US, including wetlands, associated with the Dulles Corridor Rapid Transit Project in March of 2002 (Appendix K). A separate jurisdictional determination was provided for waters of the US located at Dulles International Airport in September of 2001 (Appendix K). As a result of modifications to project design, in August and September of 2004, additional coordination was undertaken to supplement the jurisdictional determination near the alignment's crossing of Centerville Road (P-15).

Additional coordination between USACE, VDEQ and the EPA took place in March of 2003 (Appendices J and K). Given the length and complexity of the project, the agencies agreed that a total of one to two acres of permanent wetland impact is minimal relative to other similar projects. Furthermore, the USACE has indicated that an individual permit would be appropriate for the project. During final design, a Joint Permit Application will be filed for the project with VDEQ.

In accordance with Clean Water Act Section 404(b)(1) guidelines and U.S. DOT Order 5660.1A, project planning and design activities were conducted to avoid and minimize impacts to wetland resources to the maximum extent practicable. Based upon these efforts and coordination with the USACE, complete avoidance of impacts to waters of the United States, including wetlands, is not practicable for the full LPA.

Minor impacts would occur from bridge support piers, construction of stations and facilities, and stormwater management outfalls. However, as part of the planning and preliminary design processes, modifications and refinements were undertaken to avoid or minimize impacts to the extent possible. Table 4.2-3 details the acreages of wetland systems that would be affected by the implementation of the project and the amount (based on regulated ratios) of wetlands proposed for mitigation. Wetland systems W-RIS (two separate areas), W-FB/FBA/F, and W-RISA are located under proposed aerial structures. Due to bridge construction, these wetlands would incur a change in vegetative class from forested wetland to emergent. This change in vegetative class would result in permanent effects to the forested wetland and temporary impacts to the emergent wetland that would re-establish after construction.

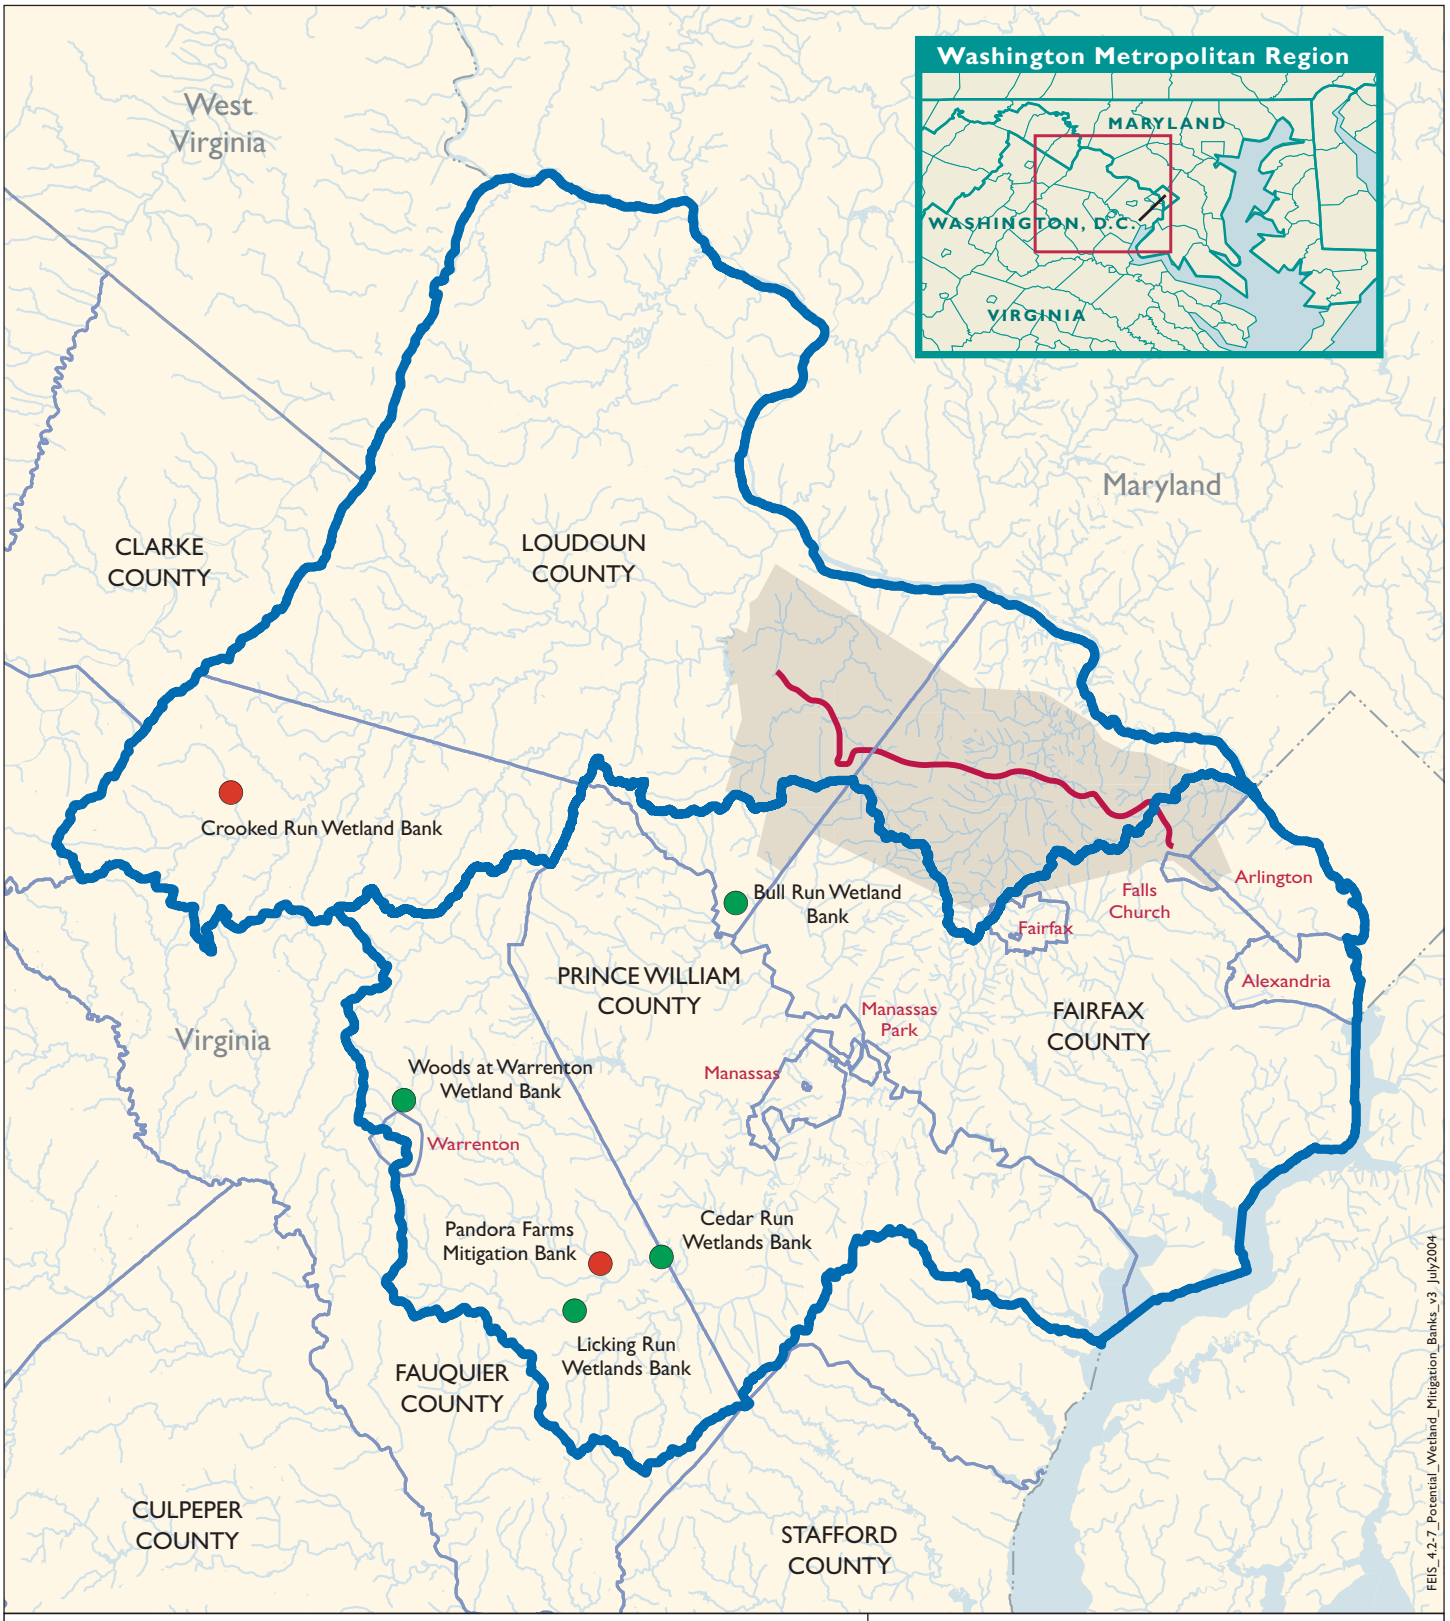

Table 4.2-3: Proposed Wetland Mitigation for the full LPA

Wetland Number	Cowardin System Class	Wiehle Avenue Extension Wetland[1] (acres)	Wiehle Avenue Extension Replacement Ratio[2]	LPA Wetland (acres)	LPA Replacement Ratio[2]
P-15	Palustrine Emergent Wetland	-	-	0.3	1:1
W-80	Palustrine Emergent Wetland	-	-	0.1	1:1
W-60	Palustrine Emergent Wetland	-	-	0.1	2:1
W-FB/FBA/F[3]	Palustrine Forested Wetland	-	-	0.4	2:1
W-RIS	Palustrine Forested Wetland	-	-	0.2	2:1
W-RISA	Palustrine Forested Wetland	-	-	0.1	2:1
W-MMMA	Palustrine Emergent Wetland	-	-	0.1	1:1
W-MMMB	Palustrine Emergent/Forested Wetland	-	-	0.1	2:1
W-MMMCI/ MMMD	Palustrine Emergent/Forest Wetland	-	-	0.2	2:1
W-RIS[3]	Palustrine Forested Wetland	-	-	3.1	1:1
W-MMMG	Palustrine Forested Wetland	-	-	0.2	2:1
W-51	Palustrine Forested Wetland	-	-	0.2	2:1
W-50	Palustrine Emergent Wetland	-	-	0.1	1:1
TOTAL		**-**	**-**	**5.2**	**-**

1. All wetland impacts occur after Wiehle Avenue, therefore there are no wetland impacts under the Wiehle Avenue Extension.
2. USACE has established replacement ratios for wetlands only.
3. This impact would be a change in vegetative classification from a forested to an emergent wetland.

DRPT would provide compensatory mitigation for unavoidable wetlands impacts. A 1:1 replacement ratio for impacts to emergent wetlands and a 2:1 replacement ratio for impacts to forested wetlands would be used. For impacts that involve a change in vegetative class from forested to emergent, a 1:1 replacement ratio would be used. Because on-site mitigation is not allowable on airport property due to potential wildlife interference with airport operations, an off-site location for mitigation would be used. Impacts would be mitigated through the purchase of credits at an existing regional wetland bank. Figure 4.2-7 shows the potential locations of wetland mitigation banks where mitigation for project impacts could take place.

To minimize impacts to wetlands during construction activities, Best Management Practices, such as pollution control devices, installation and maintenance of runoff diversion structures and secondary containment structures, would be employed. All temporarily disturbed wetland areas would be restored to pre-construction conditions by revegetating these areas with the appropriate cover type (emergent, scrub-shrub, or forested) as required by applicable permits.

Potential Wetland Mitigation Banks

Dulles Corridor Rapid Transit Project

4.2.6.3 Floodplains

U.S. DOT Order 5650.2 requires transportation facilities and projects to give proper consideration to the avoidance and mitigation for adverse floodplain impacts. The full LPA would not increase the floodplain surface elevation at any location by more than one foot; therefore no mitigation is proposed. As the project's design is refined, plans would be reviewed with the applicable agencies and all the facilities located within floodplains would be designed to comply with the federal, state, and local regulations.

During construction, DRPT would comply with federal, state, and local regulations governing construction in floodplains.

4.2.6.4 Critical Areas

Stream corridor policies adopted in the *Fairfax County Comprehensive Plan* and *Loudoun County Revised General Plan* cover the streams that would be crossed by the project. These project-related crossings would not substantially alter the course, current, or cross-section of the streams.

Based on coordination with Fairfax County two previously designed EQCs are within the project limits: Scotts Run and a wetland system (designated for purposes of this study as W-61). Because the LPA runs within the median of existing transportation facilities, impacts to these EQCs and potential EQCs have been minimized. In order to further minimize impacts to these EQCs, Best Management Practices would be employed. All activities within these areas would be in accordance with the Erosion and Sediment Control Law (Section 10.1-560 et seq. of the *Virginia Code*) and with Chapter 104 of the Fairfax County Code and with the Stormwater Management Act (Section 10.1-603 et. Seq. of the *Virginia Code*).

The proposed new crossing of Horsepen Run and wetland complex would require review by Loudoun County for consistency with the Comprehensive Plan policies to protect water quality and habitat and RSCOD designations. Mitigation for all critical areas affected would be consistent with local ordinances.

During construction, DRPT would also comply with the terms of the federal Coastal Zone Management Act consistency determination.

4.2.6.5 Hazardous Wildlife Attractants At or Near Airports

DRPT will coordinate with FAA to ensure compliance with FAA Advisory Circular No. 150/5200-33 and control potentially hazardous wildlife from interfering with airport operations and safety. The use of "dry" water retention basins within 10,000 feet of aircraft movement areas, loading ramps, or aircraft parking areas at Dulles Airport is recommended.

4.3 AQUATIC BIOTA AND HABITAT

Aquatic biota are creatures and plants that live in water. Effects to aquatic biota are presented below. Effects to aquatic habitat are presented in Section 4.2 of this Chapter.

4.3.1 LEGAL AND REGULATORY CONTEXT

Aquatic habitats could be protected under a variety of regulations that limit their use or destruction. A detailed discussion of the aquatic habitats protected under Section 404 of the Clean Water Act can be found in Section 4.2. In addition, Virginia Department of Game and Inland Fisheries (VDGIF) regulates non-endangered wildlife at the state level. Plant and animal species whose populations have declined to

a point where extinction is imminent are afforded protection under federal and state laws. These species are discussed in more detail in Section 4.5.

4.3.2 METHODOLOGY

Aquatic biota and habitat within the study area were assessed by reviewing color aerial photographs taken in the spring of 2000 and by conducting field reconnaissance from December 2000 to February 2001. Aquatic habitat was characterized within 300 to 2,000 feet of the proposed locations of alternatives. The study area varied depending on the types of proposed facilities (e.g., stations, maintenance and storage facilities and construction staging areas).

Available data, supplemented by field observations, were used to characterize the aquatic biota and habitat in the study area. Aquatic wildlife species encountered during fieldwork for the project were identified and documented using identification keys and field guides. Data regarding general land use, stream origin and type, summary of riparian vegetation features, and measurements of in-stream parameters such as width, depth, flow and substrates were assessed to understand the health of the aquatic community. This assessment was supplemented with information obtained from federal, state, and local agencies.

Agencies including the VDEQ, USGS, VDCR, VDGIF, Virginia Department of Agriculture and Consumer Services (VDACS), Fairfax County Department of Health, Virginia Department of Public Works and Environmental Services, Northern Virginia Soil and Water District, and Fairfax and Loudoun County health departments were contacted to obtain existing information about water quality data, streams, and aquatic species within the study area.

Potential impacts to aquatic biota and habitat from the proposed project were assessed using an overlay analysis of project alternatives with the existing resources. For aquatic habitat and its corresponding wildlife, a potential impact is defined as one that would permanently alter the hydrology or biological structure of an aquatic community.

4.3.3 EXISTING CONDITIONS

The Middle Potomac-Catoctin and Middle Potomac-Anacostia-Occoquan watersheds traverse the Dulles Corridor and are part of the Potomac-Shenandoah River Basin. The study area lies entirely within this basin. A total of eight major streams and their contributing tributaries bisect the Dulles Corridor, including Pimmit Run, Scotts Run, Courthouse Spring Branch, Wolftrap Creek, Difficult Run, Sugarland Run, Horsepen Run, and Broad Run.

Perennial and intermittent non-tidal streams provide most of the aquatic habitat throughout the project corridor. There are also a few ephemeral streams (defined as having flowing water only during and for a short duration after precipitation events in a typical year, with no groundwater influence) that serve as an aquatic habitat for some biota on a seasonal basis.

Portions of Difficult Run and Broad Run are designated as natural heritage resources by the VDCR. Natural heritage resources are defined as the habitat of rare, threatened, or endangered plan and animal species, unique or exemplary natural communities, significant geologic formations, and similar features of scientific interest. The Broad Run-Route 607 Stream Conservation Unit is designated by the Commonwealth of Virginia as a site of general bio-diversity significance associated with the yellow

lampmussel (*Lampsilis cariosa*), designated as a species of special concern by the VDGIS. The Difficult Run Stream Valley Conservation Site is also designated as a site of general bio-diversity significance associated with the wood turtle (*Glyptemys insculpta*).

Non-tidal waters are restricted to both modified/natural stream channels and ponds. Most of the ponds within the corridor are used for stormwater management in areas of intense development such as Tysons Corner or in recently developed areas within the activity centers of Reston, Herndon, and Dulles Airport. Most of the ponds observed in eastern Loudoun County were once used for agricultural purposes and are now being used to manage stormwater at construction sites and new developments. Table 4.3-1 presents a summary of the aquatic habitat and biota within the corridor as it occurs from east to west.

Table 4.3-1: Summary of Aquatic Biota and Habitat within the Dulles Corridor

Name	Species Observed	Notes/Other Characteristics
Pimmit Run and unnamed tributaries	American eel, white sucker, blacknose dace, creek chub, redbreasted sunfish	Intensely developed watershed Channelized stream sections, sediment deposition, unstable sediment bars
Scotts Run	Bluegill, blacknose dace, creek chub, largemouth bass, longnose dace, white sucker	High degree of development and impervious cover Outside study area higher quality conditions found
Unnamed ponds in Tysons Corner	Frogs, dragonflies, turtles	Provide stormwater management function for commercial complexes and townhouse communities
Courthouse Spring Branch	Blacknose dace, creek chub, tessellated darter, white sucker, American eel, rosyside dace, longnose dace, central stoneroller, common shiner, bluegill, swallowtail shiner	Gravel substrate, frequent riffle/pool sequence Surrounding land use is wooded
Wolftrap Creek	Creek chub, white sucker, longnose dace, bluegill	High impervious cover in headwaters
Difficult Run	Blacknose dace, creek chub, tessellated darter, white sucker, American eel, rosyside dace, longnose dace, central stoneroller, common shiner, bluegill, swallowtail shiner	Habitat is good upstream of DIAAH and fair downstream DIAAH
Sugarland Run and unnamed tributaries	White sucker, bluntnose minnow, creek chub, balcknose dace, yellow bullhead	Intense development and degree of impervious cover Sediment deposition, beaver dams
Horsepen Run	White sucker, green sunfish, creek chub, blacknose dace, yellow bullhead	Localized erosion and increased silt deposition near undersized roadway culverts
Horsepen Lake	Ring-necked duck, mallard, ring-billed gull	Backwater conditions due to roadway embankment that acts as a dam Active channel widening, down-cutting, moderate to severe erosion, unstable banks
Dulles Lake	Ring-necked duck, mallard, ring-billed gull	Primary stormwater management facility for Dulles Airport
Broad Run and unnamed tributaries and ponds	Pumpkinseed, yellow bullhead, largemouth bass, longnose dace	Fair conditions near Dulles Greenway, good conditions upstream from Dulles Greenway Sediment deposition due to construction upstream from Dulles Greenway
Abandoned farm ponds located in Loudoun County	Breeding areas for dragonflies, peepers, bullfrogs, spotted salamanders, wood frogs	Stagnant conditions

4.3.4 LONG-TERM EFFECTS

The long-term effects of the No Build Alternative and the LPA on aquatic biota are described in the following sections. Impacts to aquatic habitat are presented in Section 4.2, Table 4.2-2.

4.3.4.1 No Build Alternative

Under the No Build Alternative, there would be no effects to aquatic biota and habitat from the Dulles Corridor Rapid Transit Project.

4.3.4.2 Wiehle Avenue Extension

Because the alignment and facilities for the Wiehle Avenue Extension are located within developed areas away from aquatic habitats, major long-term effects to aquatic biota and habitat are not anticipated. The alignment would cross an unnamed tributary to Pimmit Run, Pimmit Run, Scotts Run, Courthouse Spring Branch, Wolftrap Run, and Difficult Run in the middle of the existing highway bridges of the DIAAH. These crossings would not affect the biological structure of the aquatic communities. With the exception of Difficult Run, all streams have been transformed to culverts under the DIAAH/Dulles Toll Road. Because these streams are channelized and the new LPA alignment would be located in the median of the DIAAH, the Wiehle Avenue Extension would have minimal long-term effects on aquatic biota and habitat.

Permanent stormwater management ponds would be located along the DIAAH/Dulles Toll Road to replace the grassy swales that are currently in the median of the DIAAH. These ponds would add a marginal amount of aquatic habitat to the study area.

4.3.4.3 Full LPA

Under the full LPA, a proposed parking structure at the Herndon-Monroe station would displace a portion (0.1 acre) of an emergent wetland (W-80); this would impact the aquatic biota and ecology afforded by the wetlands. Further details on this impact are presented in Section 4.2.

At the Route 28 Station, facilities would displace a portion (0.1 acre) of W-60 (forested wetland associated with W-61). It is anticipated that long-term effects to aquatic biota and habitat would be minimal. Further details on this impact presented in Section 4.2.

The alignment for the full LPA would cross Horsepen Run within the median of the DIAAH. The piers for this new crossing would be located outside of Horsepen Run in its floodplain. Minimal effect to aquatic biota and habitat is anticipated.

A small amount of aquatic habitat would be displaced by the LPA alignment as it exits the airport to enter the median of the Dulles Greenway. Because the alignment is aerial in this section, the amount of habitat displaced would be very small. It is not anticipated that placement of piers in this area would permanently alter the hydrology or biological structure of the aquatic community associated with these wetlands.

At the Route 772 Station, facilities located north of the Dulles Greenway, would displace a portion of an emergent wetland and approximately 220 linear feet of an associated tributary because the stream would most likely be piped under a planned access road for the facilities. Because most of the tributary has already been placed in a concrete-lined ditch to convey surface runoff, it is anticipated that there would not be any additional effects to the biological structure and hydrology of the tributary and Broad Run.

A road leading to sub station TP-15 would affect 25 linear feet of an intermittent tributary to Broad Run (W-50). The stream would be piped under the road.

The yard lead for S&I Yard Site 15 would span both Stallion Branch and Horsepen Run near their confluence. Significant long-term impacts are not anticipated for either stream due to a planned bridge span at these crossings. In addition, the riparian buffer has previously been displaced or removed near this crossing. It is unlikely that the track alignment would affect the existing water quality conditions at the Horsepen Run/Stallion Branch crossing, therefore the aquatic biota and habitat would not be affected.

4.3.5 CONSTRUCTION EFFECTS

The construction-related effects of the Wiehle Avenue Extension and full LPA on aquatic habitat and biota could include temporary effects to aquatic habitat at Dulles Airport in the area where the alignment departs the airport roadway to enter the median of the Dulles Greenway. Temporary access paths would be cleared so that the piers for the aerial alignment can be constructed.

Temporary effects to aquatic habitats would occur at P-15 during construction of the stormwater management pond.

Temporary effects to aquatic habitat would occur at areas where the lead to the S&I Yard 15 would cross streams and wetlands.

W-60 would be temporarily affected by restricting surface water flow while a structure is constructed under the entrance/exit of the Route 28 Station facility. W-50 would be temporarily affected by restricting surface flow while an access road to an ancillary facility is being constructed.

Construction effects would be minimized through adherence to erosion and sediment control, compliance with local ordinances and use of Best Management Practices. Construction of the Wiehle Avenue Extension or the full LPA would not be expected to result in any long-term effect to aquatic biota or their critical habitat.

Where the Project crosses and has the potential to affect perennial streams, VDGIF has recommended that DRPT conduct mussel surveys to determine the presence of mussel species within 6 months prior to construction activities. All mussels encountered would be relocated upstream into suitable habitat to avoid construction related impacts.

4.3.6 MITIGATION

Any effects of the Wiehle Avenue Extension and the full LPA on aquatic biota and habitat would be addressed by the mitigation proposed for water resources as discussed in Section 4.2.6. No additional mitigation measures are proposed.

4.4 TERRESTRIAL BIOTA AND HABITAT

This section refers to terrestrial biota (regional flora and fauna) and habitat resources along the corridor, including agricultural land, old fields, landscaped areas, and forest. Terrestrial biota refers to animals and plants that live on land.

4.4.1 LEGAL AND REGULATORY CONTEXT

Terrestrial habitats located outside of private or public (local, regional, state, or federal) preserves, management areas, parks, or other legally protected areas have no special regulations limiting their use. However, plant and wildlife species within these areas are afforded legal protections. VDGIF regulates non-endangered wildlife at the state level. Federal protection also occurs for non-endangered wildlife under the Migratory Bird Treaty Act of 1918, last amended in 1986. This act provides protection for all native migratory game and non-game birds with exceptions for the control of species that cause damage to agricultural or other interests. It also empowers the federal government to regulate the hunting season for all game species. Plant and animal species whose populations have declined to a point where extinction is imminent are afforded protection under federal and state laws. These species are discussed in more detail in Section 4.5.

4.4.2 METHODOLOGY

Terrestrial biota and habitat within the study area were assessed by reviewing color aerial photographs taken in the spring of 2000 and by conducting field reconnaissance from December 2000 to February 2001. Terrestrial habitat was characterized within 300 to 2,000 feet from the centerline of the DIAAH and the Dulles Greenway. The study area varied depending on the types of improvement proposed (e.g., stations, maintenance and storage facilities, and construction staging areas).

Forest cover types were classified broadly and are based on a review of aerial photography and general field observations of representative forests within the study area. To assess the potential presence of county and state champion trees (a champion tree is the largest tree of its species that occurs within a given jurisdiction such as a state or county) within the study area, consultations were conducted with urban foresters from the Urban Forestry Branch of Fairfax County's Department of Environmental Management and Loudoun County's Arborist in the Department of Building and Development. Terrestrial wildlife species encountered during fieldwork for the project were documented using identification keys and field guides.

Potential impacts to these resources from the proposed project were assessed through an overlay analysis of project alternatives with the existing resources. For terrestrial habitat and its corresponding wildlife, a potential impact is defined as a conversion of the existing habitat or land use to another habitat or land use. It is presumed that the conversion would result in the death or displacement of the wildlife dependent on that habitat.

4.4.3 EXISTING CONDITIONS

Terrestrial habitat and its corresponding wildlife within the study area occur within a mosaic of developed and undeveloped landscapes. In general, landscapes within the Fairfax County portion of the project are developed or developing rapidly and only a few natural habitats remain, primarily along streambank corridors. Landscapes within the Loudoun County portion of the study area are less developed, but are also rapidly converting to commercial, institutional, and residential uses.

These terrestrial habitats vary in their ability to support wildlife. For habitats to be suitable for wildlife species they must provide food, shelter, nesting sites, and water. Within developed or rapidly developing areas, less-mobile wildlife populations are reduced to such low numbers that local extinctions are possible. More mobile species must move into increasingly smaller habitat patches, creating extreme

competition for limited resources. This leads to overall declines in wildlife populations and allows for the invasion of more disturbance-tolerant species.

Table 4.4-1: Terrestrial Biota and Habitat Summary

Habitat Type	Location within Corridor	Species Supported	Observations/Notes
Agricultural Land	Loudoun County along Dulles Greenway near Routes 606 and 772	Birds, raccoon, and white-tailed deer, other small mammals, and snakes	Provides food but lacks suitable nesting sites. In study area, habitat type consists mostly of grain and hay fields and pastures.
Old-Field	Underdeveloped parcels within Tysons Corner and adjacent to the Dulles Airport runways	Birds, raccoon, and white-tailed deer, other small mammals, and snakes	Occurs where agricultural land has been abandoned or forests have been disturbed and the land is in various stages of plant succession. In study area, habitat type typically comprised of meadow grasses, broom-sedge briers, multiflora rose, and red cedar.
Landscaped	Along Dulles Connector Road, throughout Tysons Corner, throughout the Reston-Herndon area	European starling, house sparrow, house mouse, black rat, northern mockingbird, American robin, northern cardinal, eastern chipmunk, gray squirrel, American toad, and black rat snake.	Provides least amount of habitat for wildlife and is often comprised of small areas of non-native ornamental vegetation of limited use to wildlife species. In study area, includes residential, commercial, and institutional areas with manicured lawns and tree and shrub plantings.
Forested Habitat	Non-contiguous areas along DIAAH and Dulles Toll Road in Fairfax County, larger areas of forest along Dulles Greenway in Loudoun County including around proposed S&I Yard Site 15	White-tailed deer, raccoon, opossum, gray squirrel, southern flying squirrel, eastern chipmunk, white-footed mouse, big brown bat, star-nosed mole, short-tailed shrew, striped skunk, box turtle, wood frog, spring peeper, spotted salamander, red-backed salamander, brown snake, tufted titmouse, Carolina chickadee, white-breasted nuthatch, blue jay, red-bellied woodpecker, downy woodpecker, eastern wood-pewee, ruby-throated hummingbird, and blue-gray gnatcatcher	Provides a broad range of resources for wildlife and consequently often supports a greater diversity of species than other habitat types. Diversity varies between forests based on size, degree of disturbance, community structure, presence of streams or wetlands, and proximity to other habitats. In the study area, includes upland and wetland deciduous, upland mixed deciduous/coniferous, upland coniferous, and riparian.

Forest tracts greater than 50 contiguous acres also provide habitat for a specialized group of birds. These species require large tracts of forest to sustain viable breeding populations. The group includes colorful songbirds that breed in the mid-Atlantic region and migrate to Central and South America, as well as year-round residents and short-distance migrants. Over the past 30 to 40 years many of these species have shown consistent population declines because of habitat loss in their wintering grounds and forest fragmentation of their breeding grounds. In smaller woodlots, concealment from predators is difficult. These birds commonly encountered in Northern Virginia include red-shouldered hawk, hairy woodpecker, pileated woodpecker, Acadian flycatcher, wood thrush, red-eyed vireo, northern parula, black-and-white warbler, worm-eating warbler, ovenbird, Louisiana waterthrush, and scarlet tanager.

No trees from the Fairfax or Loudoun counties' champion tree lists are present within the study area.

4.4.4 LONG-TERM EFFECTS

The long-term effects of the No Build Alternative and the LPA on terrestrial habitat and biota are described in the following sections.

4.4.4.1 No Build Alternative

Under the No Build Alternative, there would be no effects to terrestrial biota and habitat from the Dulles Corridor Rapid Transit Project.

4.4.4.2 Wiehle Avenue Extension

Because the Wiehle Avenue Extension would primarily be located within the medians of existing roadways and in areas developed or rapidly developing, the potential long-term impacts are minimal.

Small areas and strips of forested habitat would be removed within the existing S&I Yard located near the West Falls Church Station, along a narrow swath extending from the yard onto the median of the Dulles Connector Road, and in the vicinity of two traction power substations and two tie-breaker stations. In addition, the landscaped area in the median of the Dulles Connector Road and DIAAH also would be removed.

Small areas of old-field and very narrow strips of forested habitat along Scotts Run would be removed to accommodate the Tysons East and Tysons Central 123 stations. Small areas of landscaped, old-field, and forested habitat would be removed for the station facilities at Wiehle Avenue. These small areas of habitat are located within busy urban areas, surrounded by transportation facilities. Accordingly, they are of limited importance for terrestrial wildlife, serving mostly as temporary foraging areas for birds. Minimal impacts to terrestrial biota and habitat are anticipated.

Two stormwater management ponds, P-5 and P-6, and one traction power substation, TP-7 have been identified as having potential impacts on forested areas adjacent to the DIAAH/Toll Road. These facilities would have a minimal effect on the terrestrial habitat within the corridor. To the extent possible, clearing would be minimized to reduce impacts on terrestrial habitat.

4.4.4.3 Full LPA

The effects of the full LPA on terrestrial biota and habitat are similar to those described above for the Wiehle Avenue Extension, except as described below.

Small amounts of landscaped habitat would be removed along the median of the DIAAH from Wiehle Avenue to Dulles Airport. These small areas of habitat are located within busy urban areas surrounded by transportation facilities. Accordingly, they are of limited importance for terrestrial wildlife, serving mostly as temporary foraging areas for birds. Minimal impact to terrestrial biota and habitat is anticipated.

Small areas of forested habitat would be cleared for traction power substations, tie-breaker stations, and stormwater management ponds. It is not anticipated that this would affect terrestrial wildlife, as this habitat type is present in adjacent parcels and provides minimal habitat.

Construction of the pond near Chathams Ford would reduce the available habitat for deer, but not to the point that deer would be forced onto nearby roads. Several wildlife corridors are accessible from the Chathams Ford Road vicinity and include Difficult Run, Wolftrap Run, and Courthouse Spring. Forested corridors parallel the Dulles Toll Road from Beulah Road to Route 7 and provide passage for wildlife.

The new park-and-ride facility at the Herndon-Monroe Station would include two proposed parking structures located immediately east and west of the existing structure. The proposed parking facility to the west would affect a minor amount of forested habitat. It is not anticipated that this would affect terrestrial wildlife, as this habitat type is present in adjacent parcels and provides minimal habitat.

At the Route 28 Station, landscaped and forested habitat would be displaced for the station facilities to the north and south of the DIAAH, respectively. The effects to plants and animals due to the displacement of the landscaped area would be minimal. The area to the north of the DIAAH is currently maintained for soccer fields. The station facilities to the south of the DIAAH would be located in what is currently a deciduous forest. Displacement of the forest in this area would create a large opening in the forest habitat, providing opportunities for nest predators such as brown-headed cowbirds.

Within Dulles Airport, the LPA alignment would primarily run along landscaped and paved areas in its aboveground segments. The one exception is where the northern connection heads north from the airport to the Dulles Greenway. In this area, the alignment extends through a deciduous forest for a short distance before crossing Horsepen Run and entering the median of the Greenway. While the amount of forest clearing is not extensive, it would create a new opening within a contiguous forest patch of about 100 acres. As described above, contiguous forests greater than 50 acres serve as a valuable habitat for various birds. Other wildlife species could be displaced from the area adjacent to the new rail line, but sufficient habitat would remain to ensure survival of all the species.

The Route 606 Station would be placed on a parcel that is partially wooded and would be cleared during construction. It is not anticipated that this would affect terrestrial wildlife, as this habitat type is present in adjacent parcels and the site provides minimal habitat.

Traction power substation TP-19, located just south of Loudoun County Parkway, and tie-breaker station B-8, located north of Route 772 Station, would affect minimal amounts of old-field habitat.

The Route 772 Station facilities that would be located on the north and south sides of the Dulles Greenway would result in the removal of a moderate amount of old-field and forested habitat. The Route 772 Station facilities would affect approximately eight acres of upland forest and a small area of agricultural land. Removal of this forest would further reduce the available natural areas in this rapidly developing landscape. Although placement of the station at the edge of the forest would minimize the impact, it is important to note that according to the Loudoun County Revised General Plan and the Toll Road Plan, the area around the proposed Route 772 station facilities is intended to support high-density development as a transit node.

S&I Yard Site 15 would result in approximately 20 acres of mostly deciduous forest being removed. The proposed aerial yard lead for Site 15 would create an opening in the large forest stand, reducing the overall quality of the stand. The resulting effects to terrestrial biota are anticipated to be minimal. Wildlife impacts could involve displacement of some individual animals, however, local species extinctions are not anticipated as sufficient habitat would remain.

4.4.5 CONSTRUCTION EFFECTS

Construction of the Wiehle Avenue Extension and full LPA is not expected to result in any long-term effects to terrestrial biota and habitat.

Minimal short-term effects to terrestrial biota and habitat are anticipated as a result of constructing the proposed full LPA, and could include short-term noise and vibration and air pollution from the construction equipment and activities. In coordination with VDEQ, Best Management Practices would be used and local ordinances would be followed to protect trees in construction areas from the effects of the project.

Two stormwater management ponds, P-5 and P-6, and one traction power substation, TP-7 have been identified as having potential impacts on forested areas adjacent to the DIAAH/DullesToll Road. Construction of these facilities would have a minimal affect on the terrestrial habitat within the corridor. To the extent possible, clearing would be minimized to reduce impacts on terrestrial habitat.

4.4.6 MITIGATION

Long-term or construction impacts to terrestrial biota and habitat are anticipated to be minimal. Therefore, no mitigation measures are proposed.

4.5 RARE, THREATENED, AND ENDANGERED SPECIES

This section presents a discussion of the potential effects to rare, threatened, and endangered (RTE) species within the Dulles Corridor.

4.5.1 LEGAL AND REGULATORY CONTEXT

Plant and animal species whose populations have declined to a point where extinction is imminent are afforded legal protection under federal and state laws. Federally listed threatened and endangered species and designated critical habitat are regulated pursuant to Section 7 of the Endangered Species Act of 1973. A listing of these species and their federal status is published in the Federal Register. The National Marine Fisheries Service (NMFS) and US Fish and Wildlife Service (USFWS) are authorized to identify those species in danger of extinction and provide for their management and protection. USFWS also maintains a list of candidate species that do not have threatened or endangered status but are of special concern. All of these listed species are collectively referred to as RTE.

In addition to protecting federally listed species, the Commonwealth has enacted laws and adopted regulations to protect state-designated endangered and threatened species. Under the Commonwealth's Endangered Plant and Insect Species Act of 1979, threatened or endangered plants and insects are protected. The Act provides for the listing and protection of species through Virginia Department of Agriculture and Consumer Services (VDACS) with help from the Division of Natural Heritage (DNH) of VDCR. Under the Commonwealth's Endangered Species Act of 1972 (as amended in 1977), VDGIF adopted regulations protecting mollusks, fishes, amphibians, reptiles, birds, and mammals classified as endangered or threatened.

4.5.2 METHODOLOGY

The potential presence of RTE species within the Dulles Corridor was determined through contact with the USFWS, VDCR, VDACS, and VDGIF. The initial study area for RTE species consisted of Fairfax and Loudoun counties. The area was then narrowed based on the species and habitat likely to be present near the proposed improvements. Study areas for RTE species are specific to each RTE species.

Agency responses to the project team's requests for information were used to identify areas within the Dulles Corridor where RTE issues would require investigation during future phases of the project. Species encountered during project fieldwork were documented using identification keys and field guides. Potential impacts to these resources from the proposed project were assessed through an overlay analysis of alternatives with the existing resources. For RTE species, a potential effect is defined as a taking (harassing, harming, pursuing, hunting, shooting, wounding, killing, trapping, capturing or collecting, or attempting to engage in any such conduct) of the listed species or its critical habitat.

4.5.3 EXISTING CONDITIONS

The USFWS provided a review of the project area to identify potential species with federal status and species of concern that have been documented or could occur within Fairfax and Loudoun counties (Appendices J and K). The earleaf foxglove (*Agalinis auriculata*), discussed below, is presently being tracked as a species of concern by the USFWS. Species of concern are not federally regulated but represent species whose populations are being watched carefully because of recent declines or uncertain status. Within Fairfax County, the bald eagle (*Haliaeetus leucocephalus*) was the only federally listed animal species reported. Presently, the bald eagle is listed as threatened in the lower 48 states. It is known to nest in areas along the Potomac River, outside the study area.

Two federally listed plant species were also noted by the USFWS: the sensitive joint-vetch (*Aechynomene virginica*) and small whorled pogonia (*Isotria medeoloides*). The joint-vetch is known to occur in Prince William County and could also occur in Fairfax County. Specific distribution information for the small whorled pogonia was not available. No surveys for these listed species were recommended by USFWS. In Loudoun County, no documented occurrences of federally listed species were reported near the study area. Neither of these species was observed during field reconnaissance.

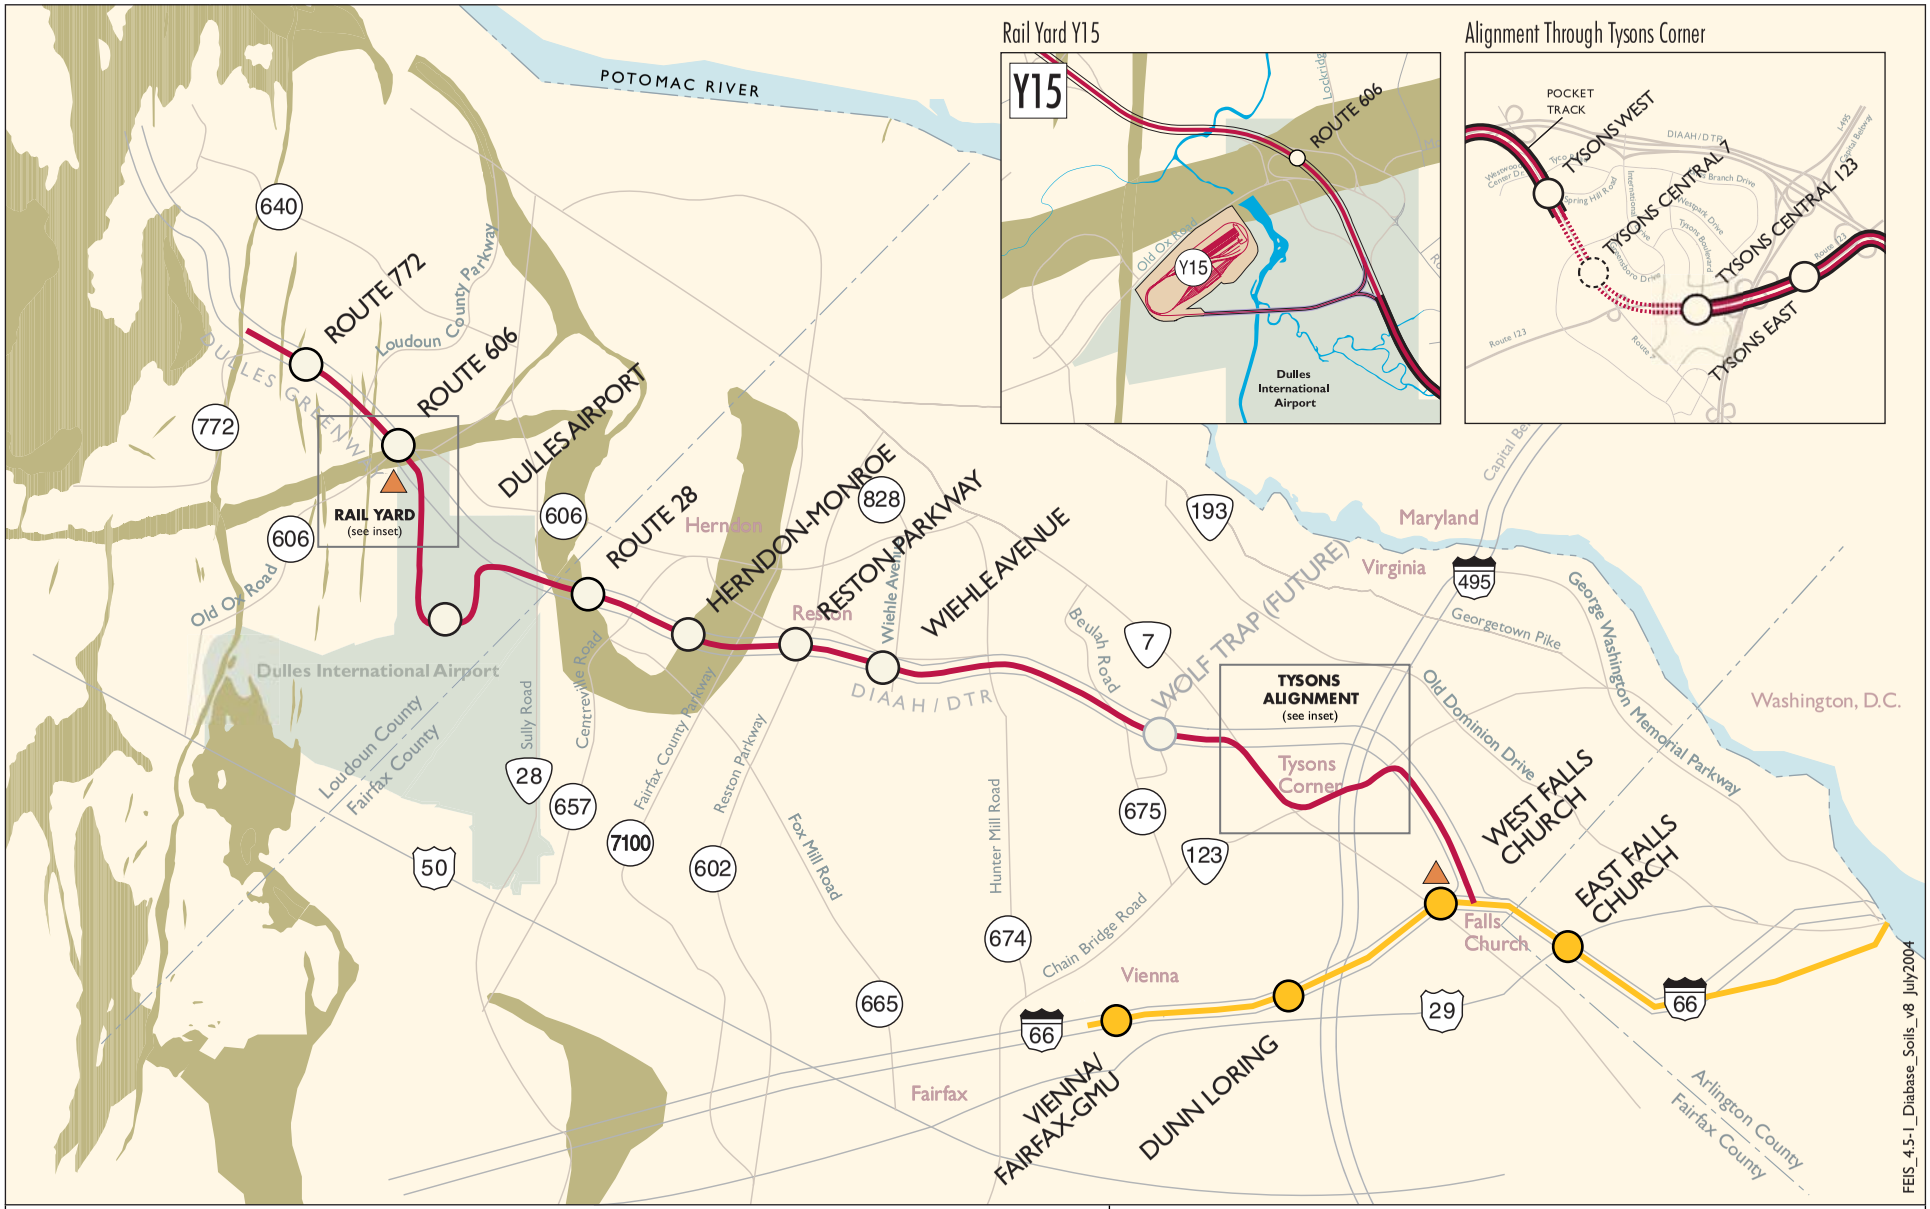
A letter from VDCR during the Major Investment Study (MIS) in January of 1995 identified an occurrence of the hairy beardtongue (*Penstemon hirsutus*) near the southwest corner of the DIAAH exit ramp to Route 28. This occurrence was not mentioned in any of the recent VDCR correspondence or agency comments.

Coordination with the VDCR and VDGIF addressed both federal- and state-listed species within the study area (Appendices J and K). Both agencies indicated that federally listed rare, threatened, or endangered species are not known to occur within the study area. However, VDGIF indicated the potential presence of two state-threatened species near the Dulles Corridor—the upland sandpiper (*Bartramia longicauda*) and wood turtle (*Clemmys insculpta*). The upland sandpiper prefers tall-grass fields in large open landscaped areas where it builds its ground nest from dried grasses. Wood turtles inhabit forested floodplains and nearby fields, wet meadows, and farmlands. The turtles are known to winter on the bottoms of creeks and streams. The streams affected by the project, including Pimmit Run, Difficult Run and Sugarland Run in Fairfax County, are designated as Threatened and Endangered Species Waters, according to the VDGIF, because of the occurrence of the wood turtle. Sightings of wood turtle have been documented within Difficult Run in Fairfax County and Sugarland Run in Loudoun County. The documented sighting of the wood turtle in Sugarland Run was well outside the study area. The VDGIF also noted that the yellow lampmussel (*Lampsilis cariosa*) is known to ocuur in the Potomac River basin in larger streams and rivers where god currents exist over sand and gravel substrate, as well as small creeks and ponds. This species is classified as a species of special concern by VDGIF; however, this designation has no legal status or protections.

The VDCR identified the presence of a unique natural community within the project corridor known as the diabase glade habitat. Diabase glades are characterized by historically fire-dominated grassland vegetation located on relatively nutrient-rich soils underlain by Triassic bedrock. Diabase flat rock, a hard dark-colored, volcanic rock, is found primarily in Northern Virginia, and is located within the geologic formation known as the Triassic Basin. Figure 4.5-1 shows bands of diabase soils crossing the Dulles Toll Road and the Dulles Greenway in western Fairfax County and eastern Loudoun County, respectively.

Several state and globally rare plant species are associated with diabase glade communities and may occur within Loudoun County near Dulles Airport, including earleaf foxglove (*Agalinis auriculata)*, white heath aster (*Aster ericoides*), blue-hearts (*Buchnera Americana*), hairy beardtongue *(Penstemon hirsutus),* downy phlox *(Phlox pilosa),* stiff goldenrod *(Oligoneuron rigidum* var. rigidum), and marsh hedgenettle (*Stachys pilosa var. arenicola*). State and federal agencies do not regulate these species, but their populations are monitored because of their uncommon occurrence in Virginia.

The most likely places to find rare diabase plants are rocky glades or in warm-season grass dominated old-field and roadside rights-of-way. The VDCR requested that specific areas within the project's predicted limits of disturbance in Loudoun County be surveyed for the rare plants associated with the diabase glade soils. Areas of particular concern were located on or near S&I Yard Site 15 located on Dulles Airport property. Other areas within the project's potential limits of disturbance in Loudoun County were ruled out because they were not underlain by diabase soils, did not contain old-field habitat and warm season grasses, and/or were already developed. Areas within Fairfax County were ruled out due to the high degree of development that has occurred.



Three field investigations were conducted to look for the rare plant species associated with diabase glade communities. The surveys were conducted in April, June, and August of 2002 because these months represent the optimal times of year to observe the six targeted rare plant species when in flower. None of the surveys resulted in identification of the rare plant specimens occurring within proposed Site 15 at Dulles Airport. Small patches of warm season habitat were unevenly distributed throughout the site but no indication of state, rare plant species were observed. The dominant vegetation observed during the surveys consists of young red cedar (*Juniperus virginiana*), goldenrod (*Solidago* sp.), Indian grass (*Sorghastrum nutans*), dogbane (*Apocynum* sp.), broom-sedge (*Andropogon virginicus*), greenbrier (*Smilax rotundifolia*), bluets (*Oldenlandia* sp.), panic grass (*Panicum* sp.), yarrow (*Achillea millefolium*), sumac (*Rhus* sp.), Eastern redbud (*Cercis canadensis*), privet (*Ligustrum* sp.), and poison ivy (*Toxicodendron radicans*). The limited diversity of warm-season grasses in combination with the growth of red cedar indicates an absence of suitable habitat for rare diabase plants.

4.5.4 LONG-TERM EFFECTS

The long-term effects of the No Build Alternative and the full LPA on RTE or their critical habitats are described in the following sections.

4.5.4.1 No Build Alternative

Under the No Build Alternative, there would be no project related effects to RTE species or their critical habitat.

Figure 4.5-1

Diabase Soils

Dulles Corridor Rapid Transit Project

4.5.4.2 Wiehle Avenue Extension

No effects to RTE species or their critical habitat would occur as a result of the Wiehle Avenue Extension. Small areas and strips of forested habitat would be removed from along the Dulles Connector Road and within its interchanges and within the West Falls Church S&I Yard. In addition, landscaped areas in Tysons Corner and in the median of the Dulles Connector Road would be removed. These habitat areas are located within busy urban areas that are surrounded by transportation facilities and are of no importance to RTE species.

The alignment would span Difficult Run via new bridge structures that would be parallel to existing structures for the DIAAH and Dulles Toll Road. Documented sightings of the wood turtle have occurred within Difficult Run well outside the study limits; therefore no adverse effect is expected.

4.5.4.3 Full LPA

The effects of the full LPA on RTE species are similar to those described above for the Wiehle Avenue Extension. West of Wiehle Avenue the proposed alignment continues to run within the median of major roadways or within Dulles Airport and stations are primarily located in developed areas. Exceptions include the proposed stations at Route 28, Route 606, and Route 772. Based on the correspondence with regulatory agencies and field reviews, these sites were reviewed for the presence of two RTE species, the upland sandpiper and wood turtle. The upland sandpiper is a state-threatened species that uses a habitat of tall-grass fields in large open areas. This habitat was not found within the undeveloped portions of the study area.

Documented sightings of the wood turtle occurring in Sugarland Run are well outside the study limits; therefore no adverse effect is expected.

4.5.5 CONSTRUCTION EFFECTS

Construction of the Wiehle Avenue Extension or full LPA would not result in any long-term effect to regulated RTE species or their critical habitat. Best Management Practices for engineering, storm water management, and sediment and erosion control would be used during the construction of bridge structures and the alignment within the median of the DIAAH to avoid water quality impacts to the streams crossed by the LPA and to minimize any potential construction-related effects on protected species.

To further minimize any potential effects on the wood turtle, VDGIF recommends that Project contractors be trained in the identification and natural history of the species prior to construction activities. Any wood turtles that are encountered during construction activities would be relocated to suitable habitat and the VDGIF would be notified.

4.5.6 MITIGATION

No long-term or construction impacts to rare, threatened, and endangered species are anticipated. Therefore, no mitigation measures are proposed.

4.6 AIR QUALITY

This section describes the air quality impact analysis conducted for the Dulles Corridor Rapid Transit Project. The potential air quality impacts would occur as a result of emissions from motor vehicle traffic associated with the project. Motor vehicle emissions vary with traffic volumes, distances traveled, travel speeds, and vehicle types.

4.6.1 LEGAL AND REGULATORY CONTEXT

The applicable statutes and regulations that govern air quality in the Dulles Corridor at both the federal and state levels are described below. The procedures that were used to demonstrate compliance with these regulations and related criteria are also included.

The Clean Air Act of 1970, as amended, is the basis for most federal air pollution control programs. The Environmental Protection Agency (EPA) under the Clean Air Act regulates air quality nationally. EPA delegates authority to the Virginia Department of Environmental Quality (VDEQ) for monitoring and enforcing air quality regulations in the Commonwealth of Virginia. The *Virginia State Implementation Plan* (SIP), developed in accordance with the Clean Air Act, contains the major Commonwealth-level requirements with respect to transportation in general. VDEQ is responsible for preparing the SIP and submitting it to EPA for approval. VDEQ also works with local and regional agencies that have air quality responsibilities.

The Dulles Corridor is within the geographic jurisdiction of the Metropolitan Washington Council of Governments (MWCOG), which has air quality responsibilities related to transportation and air quality planning in the Washington, D.C. metropolitan region. MWCOG develops the region's transportation and air quality strategies.

Under the authority of the Clean Air Act, EPA established a set of National Ambient Air Quality Standards (NAAQS) for various "criteria" air pollutants. Table 4.6-1 presents the NAAQS and the Virginia Ambient Air Quality Standards, which are identical. Presently, there are NAAQS for six criteria pollutants: ozone (O_3), carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter (PM) of diameter 10 microns or less (PM10) and 2.5 microns or less (PM2.5), and lead (Pb).

The Clean Air Act also requires EPA to specify geographic areas of the country that have measured pollutant concentrations exceeding the levels prescribed by the air quality standards (non-attainment areas). It classifies non-attainment areas and specifies compliance deadlines for these areas. The Dulles Corridor is located in Fairfax and Loudoun counties, which are located in the EPA-defined Metropolitan Washington, D.C.-MD-VA severe non-attainment area for 1-hour ozone. This area is also classified as a moderate non-attainment area for 8-hour ozone. This ozone non-attainment area must demonstrate attainment with the 1-hour ozone standard by 2005 and the 8-hour ozone standard by 2010.

Table 4.6-1: National and Virginia Ambient Air Quality Standards

Pollutant	Standard Type	Averaging Period	Standard Value[a]
Carbon Monoxide (CO)[i]	Primary and Secondary[b] Primary and Secondary[b]	8-Hour average 1-Hour average	9 ppm (10 mg/m^3)[c,d] 35 ppm (40 mg/m^3)
Nitrogen Dioxide (NO_2)[i]	Primary and Secondary	Annual arithmetic mean	0.053 ppm (100 µg/m^3)[e]
Ozone (O_3)[i]	Primary and Secondary	1-Hour average	0.12 ppm (235 µg/m^3)[f]
	Primary and Secondary	8-Hour average	0.08 ppm (155 µg/m^3)[f]
Particulate Matter (PM10)[i]	Primary and Secondary	Annual arithmetic mean	50 µg/m^3 [g]
	Primary and Secondary	24-Hour average	150 µg/m^3 [g]
Particulate Matter (PM2.5)[i]	Primary and Secondary	Annual arithmetic mean	15 µg/m^3 [g]
	Primary and Secondary	24-Hour average	65 µg/m^3 [g]
Lead (Pb)	Primary and Secondary	Quarterly mean	1.5 µg/m^3
Sulfur Dioxide (SO_2)	Primary Primary Secondary	Annual arithmetic mean 24-Hour average[h] 3-Hour average	0.03 ppm (80 µg/m^3) 0.14 ppm (365 µg/m^3) 0.5 ppm (1300 µg/m^3)

a Short-term standards (1 to 24 hours) are not to be exceeded more than once per calendar year.

b Former national secondary standards for carbon monoxide have been repealed.

c ppm: parts per million.

d mg/m^3: milligrams per cubic meter.

e µg/m^3: micrograms per cubic meter.

f Maximum daily 1-hour (8-hour) average. The ozone standard is attained when the expected number of days with maximum hourly (8-hourly) average concentrations above the value of the standard, averaged over a three-year period, is less than or equal to one.

g For each particle size, the annual PM standard is met when the three-year average of the annual mean concentration is less than or equal to the value of the standard. The 24-hour PM10 (PM2.5) standard is met when the three-year average of the annual 99th (98th) percentile values of the daily average concentrations is less than or equal to the value of the standard.

h National standards are block averages rather than moving averages.

i CO, NO_2, O_3, and PM are transportation-related pollutants

Sources: National - 40 CFR 50. Virginia - 9 VAC 5, Chapter 30.

4.6.1.1 Conformity with the Virginia SIP

In compliance with the mandates of the Clean Air Act, VDEQ has developed a SIP for air pollution control. The SIP defines the process by which the ozone NAAQS would be attained, and defines the control strategies and schedule that the Commonwealth would employ to reduce emissions in order to reach attainment.

Parts of the Washington metropolitan region, including the District of Columbia, are also classified as moderate non-attainment areas for CO. However, Fairfax and Loudoun counties, including the Dulles Corridor, are in attainment for CO. Thus the SIP requirements do not apply to CO with respect to the project. Fairfax and Loudoun counties, including the Dulles Corridor, are in attainment for NO_2, PM10, Pb, and SO_2. EPA has not yet designated areas of attainment and non-attainment for PM2.5.

Under the Clean Air Act, it is the responsibility of federal agencies, such as FTA, to ensure that a proposed project conforms to the SIP. Because the study area is located in an ozone non-attainment area, a conformity determination is required under Section 176(C) of the Clean Air Act.

A project conforms to the SIP if it comes from a conforming metropolitan transportation plan. The transportation plan for the region is the Constrained Long-Range Plan (CLRP) prepared by the MWCOG Transportation Planning Board. The Dulles Corridor Rapid Transit Project is included in the CLRP, a plan which has been found by MWCOG to conform to the relevant SIPs (i.e., those of Virginia, Maryland, and D.C.). EPA, FHWA and FTA have concurred in that conformity determination for the CLRP. Therefore, the Dulles Corridor Rapid Transit Project conforms to the SIP. Near-term phases of the project are included in an approved conforming Transportation Improvement Program (TIP), for the Fiscal year 2004 element. As the dates for implementation of the later phases of the project approach, they will be included in approved and conforming TIPs.

4.6.2 METHODOLOGY

In accordance with EPA guidance, the analysis methodology consisted of an intersection assessment and a dispersion modeling analysis for computing CO concentrations at candidate intersections along the corridor. The intersection screening methods were based on EPA criteria in the *Guideline for Modeling Carbon Monoxide from Roadway Intersections* (November 1992). The study area for air quality consists of the intersections modeled.

4.6.2.1 Intersection Screening

Motor vehicles emit CO at the highest rates when they are operating at low speeds or idling. For this reason, the potential for adverse air quality impacts is greatest at intersections where traffic is most congested. An initial screening of the signalized traffic intersections in the traffic study area was performed to identify intersections where traffic volumes would likely increase due to the project. In addition, the process identified one intersection at a representative proposed park-and-ride facility. Based on the results of this initial intersection screening, the 15 sites listed in Table 4.6-2 were selected for analysis. Figure 4.6-1 illustrates the location of the intersections that were used in this analysis.

Table 4.6-2: Intersections Modeled for Air Quality Impacts

I.D. No.	Intersection
1	Route 123 and Colshire Drive
2	Route 123 and Tysons Boulevard
3	Route 123 and International Drive
4	Westpark Drive and International Drive
5	Route 7 and Westpark Drive
6	Route 7 and Spring Hill Road
7	Route 7 and Tyco Road/Westwood Center Drive
8	Wiehle Avenue and Sunset Hills Road
9	Reston Parkway and Sunset Hills Road
10	Reston Parkway and Dulles Toll Road – EB Ramps
11	Reston Parkway and Sunrise Valley Drive
12	Sunrise Valley Drive and Fairfax County Parkway
13	Monroe Street and Sunrise Valley Drive
14	Centreville Road and Worldgate Drive
15	Wiehle Avenue and Park-and-Ride Entrance

In addition to the intersection analysis, a typical park-and-ride facility was modeled to assess the potential air quality impacts of such facilities. The Wiehle Avenue park-and-ride facility was selected as a worst-case representative under the Locally Preferred Alternative because it best represents the changes

proposed under both the Wiehle Avenue Extension and the full LPA. (The Wiehle Avenue facility is likely to experience a higher degree of traffic congestion than other park-and-rides and, consequently, higher CO concentration levels.) The park-and-ride analysis also includes the adjacent intersection of Wiehle Avenue with the park-and-ride entrance road.

4.6.2.2 Modeling Analysis

At each of the intersections selected for detailed air quality modeling, maximum one-hour and eight-hour CO concentrations were predicted at several locations (receptors) in the vicinity of the intersection where the maximum concentrations would be expected and where the public would have reasonable access. The traffic data used in the air quality analysis were based on traffic volumes and growth projections that included anticipated land use and density changes discussed in Section 3.1. The traffic data were developed in coordination with the MWCOG and Fairfax and Loudoun counties.

Emission factors for motor vehicles were generated using EPA's computer program MOBILE5b consistent with the Draft EIS and the Supplemental Draft EIS. The input parameter values for MOBILE5b were selected in accordance with MWCOG guidance.

Maximum one- and eight-hour CO concentrations were predicted using EPA's CAL3QHC Version 2.0 dispersion model. Specific modeling inputs were selected in accordance with MWCOG guidance. The modeling for 2011 and 2025 accounts for roadway improvements proposed by the Virginia Department of Transportation (VDOT) at several of the intersections in the study area.

4.6.3 EXISTING CONDITIONS

This section summarizes measured ambient air quality data for the region including the study area. VDEQ maintains a statewide network of monitoring stations that routinely measure pollutant concentrations in the ambient air. These stations provide data to assess compliance with the NAAQS and Virginia Ambient Air Quality Standards and to evaluate the effectiveness of pollution control strategies. The relevant monitored pollutants are ozone, NO_2, CO, PM, and SO_2. Table 4.6-3 presents the maximum measured concentrations for these pollutants measured at representative monitoring stations nearest to the study area as reported by VDEQ for the most recent full year of data (2003).

As shown in Table 4.6-3, the highest one-hour ozone concentration in 2003 from among the representative monitoring stations was 0.122 parts per million (ppm) measured at the Ashburn station. This level is above the one-hour ozone standard of 0.12 ppm. The highest eight-hour ozone concentration in 2003 was 0.116 ppm also measured at the Ashburn monitoring station. This level is above the eight-hour ozone standard of 0.08 ppm. This area of the Commonwealth is currently classified as a Severe One-Hour Ozone Non-attainment Area and as a Moderate Eight-Hour Ozone Non-attainment Area due to past violations of the ozone standards. For example, the one-hour ozone NAAQS was exceeded at VDEQ monitoring stations in northern Virginia on 9 days in 1998, 8 days in 1999, 1 day in 2000, 1 day in 2001, 21 days in 2002 and 5 days in 2003. The actual number of ozone exceedances in a given year can vary widely due to variations in meteorology. No pollutant concentrations other than ozone exceeded their respective standards in 2003. The Washington metropolitan region is in attainment for the other pollutants listed.

Table 4.6-3: 2003 Monitored Ambient Air Quality in the Region

Pollutant	VDEQ Monitor Location (City)	Averaging Period	Maximum Concentration	Second Maximum Concentration
Carbon Monoxide (CO)	Lewinsville[a]	1 Hour 8 Hours	3.6 ppm 2.8 ppm	3.3 ppm 2.7 ppm
	Chantilly[c]	1 Hour 8 Hours	1.9 ppm 1.7 ppm	1.9 ppm 1.4 ppm

4.6.4 LONG-TERM EFFECTS

The air quality analysis consists of three components, as mandated by EPA: a dispersion modeling analysis to estimate maximum one-hour and eight-hour carbon monoxide (CO) concentrations at selected roadway traffic intersections in the study area; a similar modeling analysis to estimate CO levels in the vicinity of a typical park-and-ride facility; and an assessment of the potential for localized impacts from the proposed maintenance facilities.

For the intersections and the park-and-ride facility analyses, existing CO concentrations were evaluated for 2000, while future analysis years included the No Build Alternative, the Wiehle Avenue Extension and the full LPA. The future conditions were analyzed with 2011 as the opening year of the Wiehle Avenue Extension, 2015 as the opening year for the full LPA, and 2025 as the project design year.

Although there may be concern about severe traffic congestion along major highways of the area, there are currently no federal or state regulations or requirements to analyze the CO concentration along highway mainlines. Agency requirements focus on intersections as the “worst-case” locations (i.e., the highest CO concentrations) for assessment of project impacts. Compared to intersection conditions, adverse levels of CO due to traffic on highway mainlines are very unlikely to occur for two reasons: (1) the more efficient operation of vehicle engines at highway mainline speeds, and (2) the rapid drop off of CO concentrations due to the large distances between the travel lanes and receptors located beyond the highway right-of-way. In addition, recent model year vehicles have relatively low emission rates. For these reasons, EPA and VDEQ do not require assessment of CO concentrations from highway mainlines.

4.6.4.1 No Build Alternative

Tables 4.6-6 and 4.6-7 show the maximum predicted one- and eight-hour CO concentrations, respectively, for the No Build Alternative. These concentrations were predicted for the existing conditions in 2000, and the future conditions in 2011, 2015 and 2025, to indicate air quality trends at the intersections over time.

Table 4.6-4: Maximum Predicted 1-Hour CO Concentrations (in ppm) for No Build Alternative[1] at Modeled Intersections

I.D. No.	Intersection	Existing (2000)	No Build Alternative		
			2011	2015	2025
1	Route 123/Colshire Drive	10.3	7.8	7.8	7.7
2	Route 123/Tysons Boulevard	11.0	8.7	8.4	8.4
3	Route 123/International Drive	11.9	9.0	8.7	8.4
4	Westpark Drive/International Drive	10.0	8.1	7.7	7.7
5	Route 7/Westpark Drive	10.4	9.2	8.5	8.4
6	Route 7/Spring Hill Road	11.4	8.6	8.4	8.3
7	Route 7/Tyco Road/Westwood Center Drive	11.6	9.0	8.5	8.3
8	Wiehle Avenue/Sunset Hills Road	11.0	8.9	8.4	8.4
9	Reston Parkway/Sunset Hills Road	11.8	8.9	8.5	8.6
10	Reston Parkway/Dulles Toll Road – EB Ramps	9.6	8.2	7.5	7.5
11	Reston Parkway/Sunrise Valley Drive	12.4	9.1	8.7	8.6
12	Sunrise Valley Drive/Fairfax County Parkway	11.5	8.9	8.2	8.0
13	Monroe Street/Sunrise Valley Drive	10.3	8.6	8.1	8.0
14	Centreville Road/Worldgate Drive	11.2	8.5	8.6	8.5
15	Wiehle Avenue Park-and-Ride Facility	7.1	8.3	8.1	8.0

[1]NAAQS is 35 ppm for 1-hour CO concentrations.

Table 4.6-5: Maximum Predicted 8-Hour CO Concentrations (in ppm) for No Build Alternative[1] at Modeled Intersections

I.D. No.	Intersection	Existing (2000)	No Build Alternative		
			2011	2015	2025
1	Route 123/Colshire Drive	6.0	4.3	4.3	4.2
2	Route 123/Tysons Boulevard	6.5	4.6	4.4	4.4
3	Route 123/International Drive	7.1	5.1	4.9	4.7
4	Westpark Drive/International Drive	5.8	4.5	4.2	4.2
5	Route 7/Westpark Drive	6.1	5.2	4.8	4.7
6	Route 7/Spring Hill Road	6.8	4.8	4.7	4.6
7	Route 7/Tyco Road/Westwood Center Drive	6.9	5.1	4.8	4.6
8	Wiehle Avenue/Sunset Hills Road	6.5	5.0	4.7	4.7
9	Reston Parkway/Sunset Hills Road	7.1	5.0	4.8	4.8
10	Reston Parkway/Dulles Toll Road – EB Ramps	5.5	4.5	4.1	4.1
11	Reston Parkway/Sunrise Valley Drive	7.5	5.2	4.9	4.8
12	Sunrise Valley Drive/Fairfax County Parkway	6.9	5.0	4.5	4.4
13	Monroe Street/Sunrise Valley Drive	6.0	4.8	4.5	4.4
14	Centreville Road/Worldgate Drive	6.6	4.8	4.8	4.8
15	Wiehle Avenue Park-and-Ride Facility	3.8	4.6	4.5	4.4

[1]NAAQS is 9 ppm for 8-hour concentrations.

For the 2011 No Build Alternative, the maximum predicted one- and eight-hour CO concentrations occurred at Site Number 5, Route 7 with West Park Drive, and are 9.2 ppm and 5.2 ppm, respectively. Predicted one-hour CO concentrations at the remaining sites ranged from 8.2 ppm to 9.2 ppm. Predicted eight-hour CO concentrations at the remaining sites ranged from 4.3 ppm to 5.2 ppm.

For the 2015 No Build Alternative, the maximum predicted one- and eight-hour CO concentrations occurred at two Sites, Number 3, Route 123 and International Drive and Number 11, Reston Parkway and Sunrise Valley Drive, and are 8.7 ppm and 5.2 ppm, respectively. Predicted one-hour CO concentrations at the remaining sites ranged from 7.5 ppm to 8.7 ppm. Predicted eight-hour CO concentrations at the remaining sites ranged from 4.1 to 4.9 ppm.

For the 2025 No Build Alternative, the maximum one-hour CO concentration in the project study area was predicted to be 8.6 ppm and occurred at two Sites, Number 9, Reston Parkway and Sunset Hills Road and Number 11, at the intersection of Reston Parkway and Sunrise Valley Drive. The maximum predicted eight-hour CO concentration was 4.8 ppm and occurred at the same intersections. Predicted one-hour CO concentrations at the remaining intersections ranged from 7.5 ppm to 8.5 ppm. Predicted eight-hour CO concentrations at the remaining intersections ranged from 4.1 ppm to 4.8 ppm.

All predicted CO concentrations for the 2000 Existing Conditions and for the 2011, 2015 and 2025 No Build Alternative are less than the NAAQS of 35 ppm for one hour and 9 ppm for eight hours.

The maximum one- and eight-hour CO levels for the 2025 No Build Alternative are also lower than the corresponding levels for the 2000 Existing Conditions. This decrease in CO concentrations is mainly due to the decrease in the exhaust emission factors from 2000 to 2025, as older and more polluting vehicles in the nation's fleet are replaced with new vehicles which have lower emission rates, as prescribed in the Federal Motor Vehicles Emission Control Program (FMVECP) mandated in the Clean Air Act. This reduction in the vehicle emission rates more than offsets the increase in traffic volumes from 2000 to 2025.

Ambient concentrations in the vicinity of the proposed Wiehle Avenue park-and-ride site under the existing and future No Build Alternatives are predicted to be slightly above the ambient background levels of 6.0 and 3.0 ppm for the 1- and 8-hour periods, respectively. Ambient one-hour CO concentrations at this location without the Wiehle Avenue Park-and-Ride Facility are predicted to range from 7.0 ppm under the Existing Condition in 2000, to 6.6 ppm in 2011, 6.5 ppm in 2015 and 6.6 ppm in 2025 under the No Build Alternative. No new maintenance facilities would be constructed under the No Build Alternative.

4.6.4.2 Wiehle Avenue Extension

Tables 4.6-6 and 4.6-7 show the maximum predicted CO concentrations for the Wiehle Avenue Extension and the full LPA under all future years, as well as the predicted concentrations for existing conditions in 2000. Due to changes in projected traffic conditions between the SDEIS and the FEIS, CO concentrations were revised at all Intersection Sites except 1, 2, 3, 4 and 5.

Table 4.6-6: Maximum Predicted 1-Hour CO Concentrations (in ppm) for the LPA[1] at Modeled Intersections

I.D. No.	Intersection	Existing (2000)	Wiehle Avenue Extension		Full LPA	
			2011	2025	2015	2025

14	Centreville Road/Worldgate Drive	6.6	4.8	4.6	4.8	4.6
15	Wiehle Avenue Park-and-Ride Facility	3.8	5.9	5.4	5.1	5.4

[1]NAAQS is 9 ppm for 8-hour CO concentrations.

The air quality modeling analysis for the LPA was conducted in the same way as for the No Build Alternative.

All predicted CO concentrations for the 2025 the Wiehle Avenue Extension and the full LPA are less than the NAAQS of 35 ppm for one hour and 9.0 ppm for eight hours. The maximum one- and eight-hour CO levels for the 2025 the Wiehle Avenue Extension and the full LPA are also lower than the corresponding levels for the 2000 Existing Conditions, despite the increase in hourly traffic volumes at all the modeled intersections from 2000 to 2025.

As shown in Tables 4.6-4 and 4.6-5, all maximum predictions are below the respective NAAQS. Only Wiehle Avenue park-and-ride facility showed an increase over the existing 2000 condition.

The proposed park-and-ride facility at Wiehle Avenue is designed to provide parking for a maximum of 2,300 cars. Vehicle traffic at the facility would include Express Buses, feeder buses and automobiles, and would typically be highest during the a.m. and p.m. peak commuting periods. Thus, CO emissions from idling and moving vehicles at the facility would be highest during those times.

The analysis of the park-and-ride facility included two components: 1) estimating CO concentrations at receptors located in the immediate vicinity of the facility to assess impacts from the facility itself; and 2) estimating CO concentrations near the two traffic intersections immediately next to the park-and-ride facility which would allow access into and out of the facility.

The maximum predicted one- and eight-hour CO concentrations from the Wiehle Avenue park-and-ride facility in 2011 under the Wiehle Avenue Extension occurred at a curbside receptor located near the intersection, and are 10.2 ppm and 5.9 ppm, respectively. The maximum predicted one- and eight-hour CO concentrations from the facility in 2015 under the full LPA occurred at a curbside receptor located near the intersection, and are 9.0 ppm and 5.1 ppm, respectively.

Additional storage tracks and new rail connections would be constructed at West Falls Church S&I Yard. Air quality effects at the West Falls Church S&I Yard with the Wiehle Avenue Extension would reflect the change in operations at the West Falls Church S&I Yard. Additional maintenance and service operations, for example, would result in an incremental increase in the air quality effects at the West Falls Church S&I Yard.

4.6.4.3 Full LPA

Tables 4.6-6 and 4.6-7 on the previous pages show the maximum predicted CO concentrations for the full LPA. For the 2015 full LPA, the maximum predicted one- and eight-hour CO concentrations occurred at Site Number 13, Monroe Street and Sunrise Valley Drive, and are 9.0 ppm and 5.1 ppm, respectively. Predicted one-hour CO concentrations at the remaining sites ranged from 7.8 ppm to 8.9 ppm. Predicted eight-hour CO concentrations at the remaining sites ranged from 4.3 ppm to 5.0 ppm.

For the 2025 Full LPA, the maximum one-hour CO concentration in the project study area was predicted to be 8.9 ppm and occurred at Site Number 9, Reston Parkway and Sunset Hills Road. The maximum predicted eight-hour CO concentration was 5.0 ppm and occurred at two locations: Site Number 9, Reston Parkway and Sunset Hills Road, and Site Number 13, Monroe Street and Sunrise Valley Drive. Predicted one-hour CO concentrations at the remaining intersections ranged from 7.8 ppm to 9.5 ppm. Predicted eight-hour CO concentrations at the remaining intersections ranged from 4.3 ppm to 5.4 ppm.

The predicted maximum CO concentrations would differ only slightly between the No Build Alternative and the full LPA (see Tables 4.6-4 through 4.6-7). For example, compared to the No Build Alternative in 2025, the predicted maximum CO level with the full LPA would be slightly lower at 4 intersections, slightly higher at 9 intersections, and would remain unchanged at 2 intersections. Localized increases in traffic volumes predicted along the access routes to the rail stations and park-and-ride facilities would be responsible for the slightly higher CO levels at some locations. However, other locations would experience decreases in traffic volumes because some drivers would choose to ride Metrorail, and these decreases would be responsible for the slightly lower CO levels.

At Wiehle Avenue park-and-ride, the maximum predicted one- and eight-hour CO concentrations from the facility under the Wiehle Avenue Extension and the full LPA in 2025 occurred at a receptor also located near the intersection, and are 9.5 ppm and 5.4 ppm, respectively. The predicted decrease in CO

concentrations between the Wiehle Avenue Extension and the full LPA is due to the reduction in traffic in the vicinity of the park-and-ride under the full LPA when Route 772 becomes the Metrorail end station.

The potential emission sources at S&I Yard Site 15 would be similar to those at the West Falls Church S&I Yard. The emission sources that would operate at the rail yard would be typical of such facilities. Rail vehicle maintenance may include major and minor repairs such as electrical work, welding, wheel grinding, bodywork, and painting, as well as routine maintenance and overnight storage.

The nearest residence to Site 15 is located approximately 3,400 feet from the closest potential source of emissions at that site. At this distance, ambient pollutant concentrations caused by the facility would be low because of the dilution effects due to atmospheric dispersion. Therefore, no adverse air quality impacts would be experienced from S&I Yard Site 15. Some of the proposed maintenance activities, such as paint booths, would require air quality permits from VDEQ. Permits would be obtained as a separate activity after approval of this Final EIS. The VDEQ permit application process requires that potential air quality impacts such as odors from solvent evaporation be considered and mitigated if necessary.

4.6.5 CONSTRUCTION EFFECTS

Construction activities can result in short-term impacts on ambient air quality. These potential impacts include direct emissions from construction equipment and trucks, increased emissions from motor vehicles on the streets due to disruption of traffic flow, and fugitive dust emissions. These impacts would be temporary, and would affect only the immediate vicinity of the construction sites and their access routes. Emissions from project-related construction equipment and trucks would be much less than the total emissions from other industrial and transportation sources in the region, and therefore, are expected to be insignificant with respect to compliance with the NAAQS.

The LPA would involve construction activities and equipment to support construction of railbed, tracks, and signals in the median of the Dulles Connector Road and the DIAAH; Metrorail connections to the West Falls Church S&I Yard; traction power substations and tie-breaker stations; the elevated structures in Tysons Corner; and underground facilities in Tysons Corner and at Dulles Airport.

Roadway traffic disruption due to lane closures, detours, and construction vehicles accessing the sites can cause congestion, which can increase motor vehicle exhaust emissions. Fugitive dust emissions could occur during demolition, ground excavation, material handling and storage, movement of equipment at the site, and transport of material to and from the site.

4.6.6 MITIGATION

No long-term impacts to regional air quality are anticipated from the construction and operation of the project. Therefore, no mitigation measures are proposed.

During construction, to mitigate construction-related effects on air quality, the project team would comply with VDEQ requirements for fugitive dust and emissions outlined in 9 VAC 5-50-90.

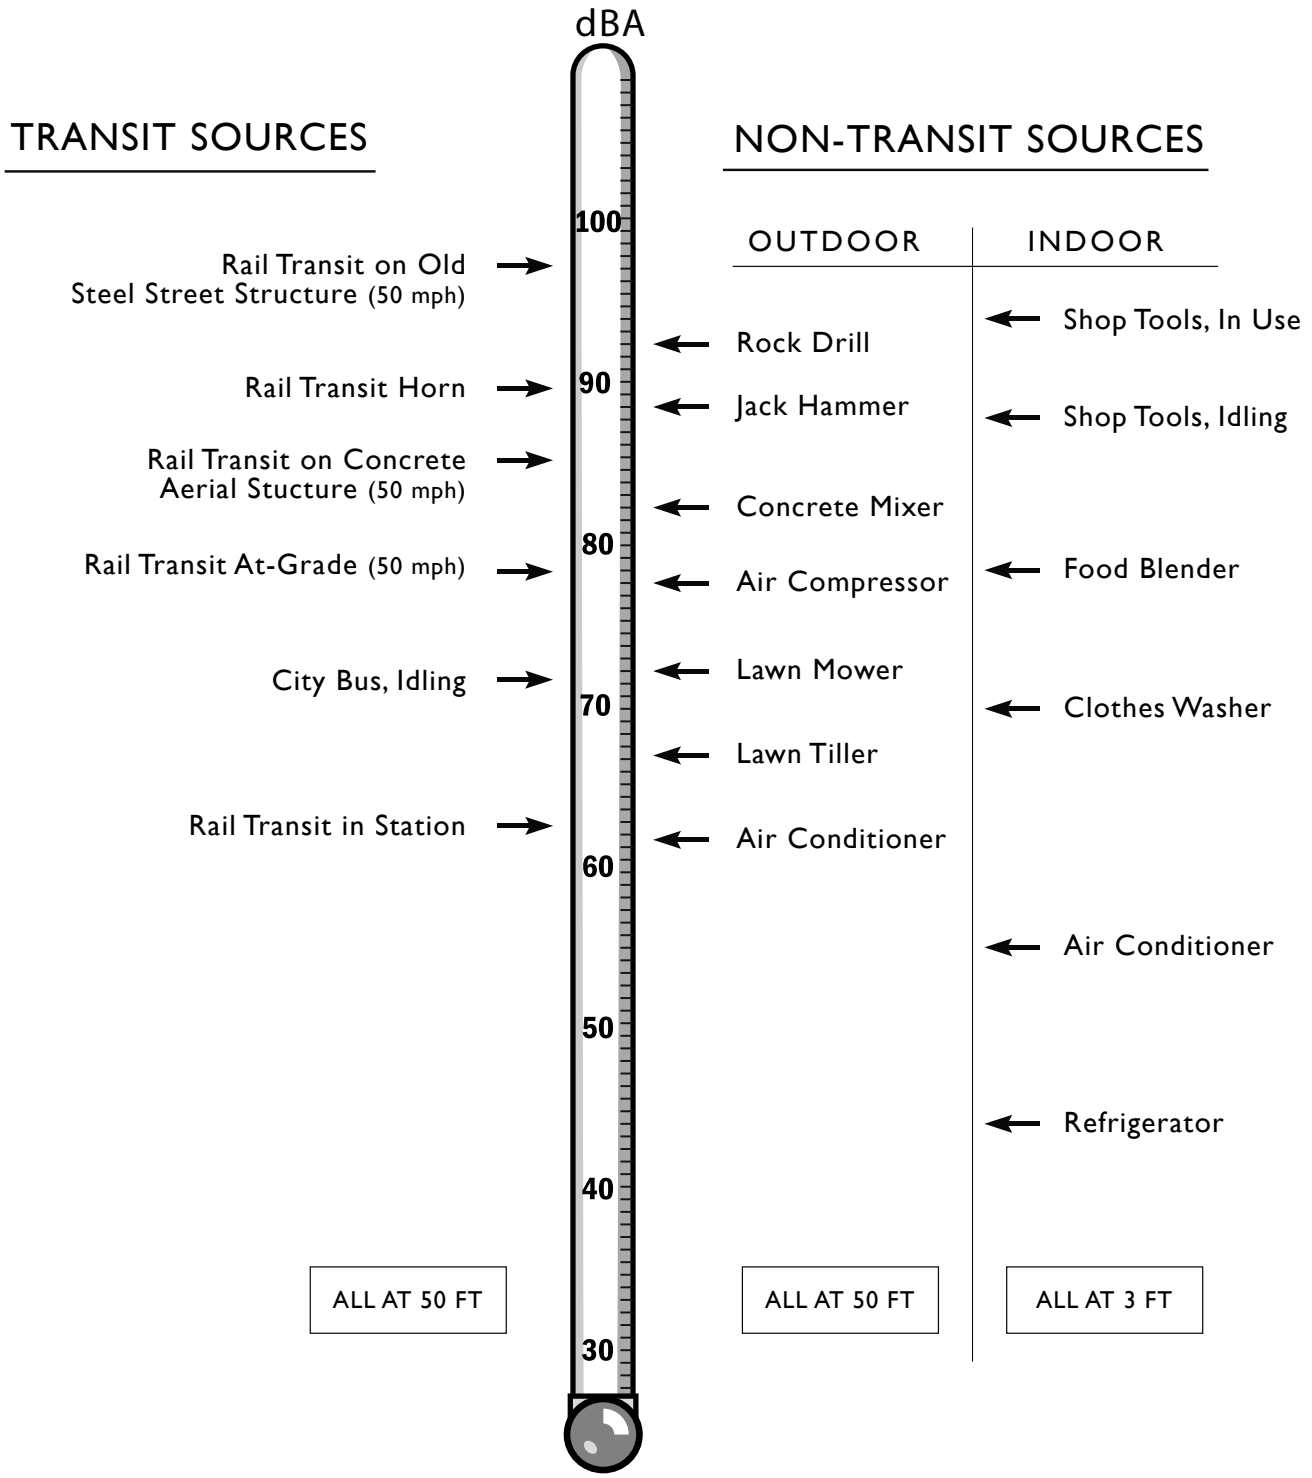
4.7 NOISE

This section includes an introduction to basic noise concepts, including noise descriptors, the prediction methodologies and modeling assumptions used for the project, the ambient noise monitoring program, and the evaluation of potential impacts along the Dulles Corridor.

4.7.1 HUMAN PERCEPTION OF NOISE

Noise is “unwanted sound” and by this definition the perception of noise is a subjective process. Several factors affect the actual level and quality of sound (or noise) as perceived by the human ear and can generally be described in terms of loudness, pitch (or frequency), and time variation. The loudness, or magnitude, of noise determines its intensity and is measured in decibels (dB) that may range from 40 decibels (the rustling of leaves) to over 100 decibels (a rock concert). Pitch describes the character and frequency content of noise such as the very low “rumbling” noise of stereo sub-woofers, or the very high-pitched whistle noise. Finally, the time variation of some noise sources can be characterized as continuous, such as a building ventilation fan; intermittent, such as for a train passby; or impulsive, like a car backfire.

Various sound levels are used to quantify noise from transit sources, including a sound's loudness, duration, and tonal character. For example, the A-weighted decibel (dBA) is commonly used to describe the overall noise level because it is an attempt to take into account the human ear's response to audible frequencies. Because the decibel is based on a logarithmic scale, a 10-decibel increase in noise level is generally perceived as a doubling of loudness, while a three-decibel increase in noise is just barely perceptible to the human ear. Typical A-weighted sound levels from transit and other common sources are shown in Figure 4.7-1.



Several A-weighted noise descriptors were used to determine impacts from transit-related sources including the Lmax, which represents the maximum noise level that occurs during a single event or train passby; the Leq, which represents a level of constant noise with the same acoustical energy as the fluctuating noise levels observed during a given interval, such as one hour; and the Ldn, or the 24-hour day-night noise level that includes a ten-decibel penalty for all nighttime activity between 10 p.m. and 7 a.m.

4.7.2 EVALUATION CRITERIA

An introduction to the evaluation criteria used to determine noise impacts during operation and construction is described in the following subsections.

4.7.2.1 Federal Noise Guidelines

The FTA’s *Transit Noise and Vibration Impact Assessment* guidance manual (DOT-95-16, April 1995) presents the basic concepts, methods, and procedures for evaluating the extent and severity of noise impacts from transit projects. Under the FTA guidelines, transit noise impact assessments are based on land use categories and sensitivity to noise from transit sources. For example, operational impacts at residential receptors (FTA Category 2) are evaluated using the 24-hour Ldn noise level while the peak-hour Leq noise level is used to evaluate impacts at institutional receptors such as schools and churches (FTA Category 3). The Leq noise level is also used to evaluate impacts at serene parks or other outdoor uses where quiet is an integral part of its use (FTA Category 1). As shown in Figure 4.7-2, the FTA noise impact criteria are defined by two curves that allow increasing project noise levels as existing noise

Figure 4.7-1

Typical A-Weighted Sound Levels

Dulles Corridor Rapid Transit Project

FEIS_4.7-2_FTANoiseImpact_v1 October2003

Note: To use this table find the existing noise level along the bottom row and follow the line up to the projected noise level using the scale on the left for Category 1 or 2 Land Uses. At the intersection of the existing and projected levels, the colored background shows *no impact* (blue), *impact* (yellow), or *severe impact* (red).

Noise exposure is in terms of Leq(h) for Category 1 and 3 Land Uses; Ldn for Category 2 Land Uses.

Source: *Transit Noise and Vibration Impact Assessment - Final Report,* Federal Transit Administration, Washington, D.C., April 1995

Figure 4.7-2

FTA Noise Impact Criteria for Transit Projects

Dulles Corridor
Rapid Transit Project

increases up to a point, beyond which impact is determined on project noise alone. The two FTA noise criteria categories, *impact* and *severe impact,* define the level of adverse reaction or annoyance from the community based on the predicted project noise level. The level of impact at any specific site can be established by comparing the predicted project noise level at the site to the existing noise level at the site. The FTA noise impact criteria for all three land use categories are shown in Figure 4.7-2.

During the environmental analysis and preliminary engineering phases of a project, the FTA guidelines suggest evaluating proposed construction scenarios against the one-hour Leq noise thresholds of 90 dBA for residences (80 dBA during nighttime construction) and 100 dBA at all non-residential receptors. These limits are evaluated against noise levels from the two loudest pieces of construction equipment that, under worst case conditions, are assumed to operate continuously for one hour during both the daytime (7 a.m. to 10 p.m.) and nighttime (10 p.m. to 7 a.m.) periods.

4.7.2.2 WMATA Noise Criteria

Potential noise impacts were also evaluated using WMATA noise criteria. While the FTA noise impact criteria are based on cumulative exposure to predict transit noise, the WMATA criteria are based on single-event maximum vehicle passby noise levels. Maximum noise levels (or Lmax) from transit vehicle passbys are applicable to single- and multi-family residences, as well as commercial receptors located in various communities. The WMATA maximum passby noise levels were applied to all modes of transit, including BRT and Metrorail passbys.

Project noise levels related specifically to facility operations, such as at passenger stations and maintenance facilities, were assessed using the WMATA "Transit Systems Ancillary Facility" criteria. Noise criteria were developed for both transient (short-time-duration) events, such as a train passby, and continuous (long-time-duration) events, such as rooftop ventilation fans. The WMATA criteria were applied to all noise—sensitive locations (receptors) identified along the Dulles Corridor. Randomly occurring noises from service and inspection yards, such as wheel squeal or railcar auxiliary equipment, were also evaluated at nearby residences using the WMATA criteria.

4.7.2.3 VDOT Noise Policy

VDOT's "State Noise Abatement Policy" (January 1, 1997) established evaluation criteria for Type I and II highway projects. These criteria include both the FHWA Noise Abatement Criteria (NAC) adopted by VDOT and a relative increase over the existing noise level criterion for various land use categories. For the relative increase over existing noise level criterion, a "substantial" increase of 10 dBA or more defines an impact from highway noise, especially at remote receptors currently not affected by existing traffic. The VDOT noise criteria were applied only to those residences located adjacent to the proposed realignment of the DIAAH and Dulles Toll Road, to create space for Metrorail pocket tracks or median transit stations. No other roadway changes affecting either capacity or elevation are expected anywhere else along the Dulles Corridor.

4.7.2.4 Local Ordinances

In addition to the FTA, WMATA, and VDOT criteria, an inventory of local and county noise ordinances was compiled for all municipalities along the Dulles Corridor. Local noise ordinances generally set limits on construction and other nuisance noises but not on transit operations. However, local noise ordinances were used to evaluate impacts from stationary sources, such as the proposed Metrorail S&I Yard and the parking garages in Fairfax County. To determine impact at these locations, maximum facility noise levels were evaluated against the residential threshold of 55 dBA and a commercial threshold of 60 dBA. Although no identified limits on maximum construction equipment noise levels are in force in any of the

communities along the Dulles Corridor, local ordinances along the Dulles Corridor generally permit construction activities during the daytime hours, from 7 a.m. to 6 p.m.

4.7.3 METHODOLOGY

The modeling methodologies and the types of noise sources included in the modeled prediction for this project are introduced herein.

Potential transit noise impacts along the Dulles Corridor were evaluated according to the FTA modeling prediction guidelines. The noise prediction modeling included all new sources of noise proposed in the study area: Metrorail train passbys, articulated express bus passbys, wheel squeal along curves, Metrorail auxiliary equipment at stations, public address systems at stations, express and feeder bus idling at stations and at park-and-ride lots. Operations data were adjusted based on the existing topography, such as acoustically hard or soft ground, terrain cuts, earthen berms, and other noise barrier walls. Project noise levels from facilities operations, such as parking garages and rail yards, were predicted using the FTA guidelines. More than 2,600 individual receptor locations were identified including single-family and multi-family residences, hotels, schools, churches, amphitheaters, offices, parks, and historic resources. Noise levels were predicted at all identified noise-sensitive receptor locations under the Wiehle Avenue Extension and the full LPA.

Construction noise expected along the Dulles Corridor was also estimated according to the procedures outlined in the FTA guidelines. Potential construction scenarios, which were estimated based on the Project elements proposed (such as at-grade and aerial track construction, stations, bridges, etc.), included both stationary and mobile equipment. For each construction scenario, the two noisiest pieces of equipment expected to be operating during each phase were selected. According to the FTA guidelines, this approach is expected to identify any potential noise impacts during the initial phases of the project when specific construction details are still preliminary.

4.7.4 EXISTING CONDITIONS

In accordance with FTA guidelines, a noise-monitoring program was conducted along the Dulles Corridor to (1) establish the existing ambient background levels within the study area and (2) develop project noise criteria.

Noise measurements were originally obtained at 30 discrete noise-sensitive receptor locations along the Dulles Corridor during the peak travel, midday off-peak, and late night hours. However, nine receptors were previously identified for other alternatives and do not appear in these tables. The total number of receptors for the Final EIS is 21. The results were used to establish baseline noise levels for both residential and non-residential receptors. The monitoring locations shown in Figure 4.7-3 were selected to be representative of the types of neighborhoods and land uses found along the corridor. The results of the noise-monitoring program are summarized in Table 4.7-2 of the Long Term Effects. The measured noise levels were fairly typical for both urban areas and community developments along highway corridors.

In addition to the community noise-monitoring program, measurements were taken to establish noise reference levels from existing sources and were intended to supplement and validate the FTA reference levels through direct comparison with project-specific levels. For example, wayside noise measurements were conducted along a section of straight track near the WMATA Arlington Cemetery Blue Line station.

Dulles Corridor Rapid Transit Project

Similarly, wheel squeal (the high-pitched, pure tone noise caused by steel wheels rubbing against steel rails) was measured from existing Metrorail trains at Ronald Reagan Washington National Airport (National Airport) and the West Falls Church S&I Yard. Wheel squeal events were recorded along revenue tracks (at National Airport) with a curve radius of approximately 770 feet and non-revenue tracks (S&I Yard) with a curve radius of only 300 feet. The observed source noise levels were used to supplement the reference noise levels included in the FTA guidelines.

4.7.5 LONG-TERM EFFECTS

A noise assessment was completed to determine the potential noise-related impacts at various sensitive receptor locations within approximately 1,000 feet of the Dulles Corridor. The noise levels at various receptors were predicted using the FTA guidelines and methodologies under both the Wiehle Avenue Extension and full LPA. These levels were then evaluated using the Project criteria to determine the onset of impact. The general locations of potentially affected noise receptors throughout the corridor is illustrated in Figure 4.7-4.

4.7.5.1 No Build Alternative

In accordance with FTA guidelines, noise impacts from the future Build Alternatives are not compared to the No Build Alternative to determine impacts. Instead, the FTA analysis methodology establishes project criteria noise limits based on existing measured noise levels in the study area. Therefore, FTA guidelines do not require a noise assessment for the No Build Alternative.

4.7.5.2 Wiehle Avenue Extension

A. FTA Criteria

Under the Wiehle Avenue Extension, peak-hour Leq noise levels, as shown in Table 4.7-2, are predicted to range from well below background at non-residential receptor locations along underground sections of track in Tysons Corner to 60 dBA at Receptors R7, R13 and R18 in Tysons Corner. The peak hour Leq(h) noise levels are not predicted to exceed the FTA Land Use Categories 1 and 3 *impact* or *severe impact* criteria threshold at any of the selected discrete receptors.

At specific residential receptors (Category 2) evaluated as part of the noise assessment, 24-hour Ldn levels under the Wiehle Avenue Extension are predicted to range from well below background at locations along underground sections of track in Tysons Corner to 65 dBA at R3 (a residence on Norwalk Street) in Falls Church. As shown in Table 4.7-2, three exceedances of the FTA Land Use Category 2 *impact* and *severe* impact criteria are predicted from Metrorail operations at locations R3, R5 and R19.

Potential FTA Noise Impact Locations

Dulles Corridor Rapid Transit Project

As shown in Table 4.7-3, corridor-wide project noise levels are predicted to exceed the FTA Category 2 Land Use *impact* criteria at 174 receptors under the Wiehle Avenue Extension and the *severe impact* criteria would be exceeded at an additional 10 receptors. Project noise levels are not predicted to exceed any FTA Land Use Category 1 or 3 criteria anywhere along the corridor.

Severe Impact	10	0	10	0
Sum	184	0	183	0

B. WMATA Criteria

Lmax noise levels from train passbys and stationary events, such as public address announcements at the stations, would range from well below the ambient background at receptors located near underground sections of track in Tysons Corner, to 78 dBA at R3 (a residence along Norwalk Street in McLean) from train passbys, as shown in Table 4.7-4. As a result, maximum passby noise levels are predicted to exceed the WMATA transit criteria threshold under the Wiehle Avenue Extension at Discrete Receptor R3 (a residence on Norwalk Street in McLean).

** Discrete receptors R14 through R17 all lie along Route 7 where the Metrorail tunnel is proposed and would not experience noise effects from Metrorail operations.

Overall, single-event Lmax noise levels under the Wiehle Avenue Extension are predicted to exceed the WMATA noise criteria threshold at 48 locations (46 residential and 2 commercial) as shown in Table 4.7-5.

Table 4.7-5: Number of WMATA Noise Impacts under the Wiehle Avenue Extension and the Full LPA

Land Use[1]	Wiehle Avenue Extension Impacts	Full LPA Impacts
Residential	46	47
Commercial	2	2
Other	0	0

1 Residential (Res.) land uses include all single- and multi-family buildings while commercial (Com.) receptors include all non-residential receptors such as offices. Other specific receptor types (Other) include schools and amphitheaters.

C. Project Facilities

Although the overall impact assessment included the noise contribution from project facilities such as passenger stations, feeder bus facilities, and parking garages, their individual contributions were also evaluated against the WMATA criteria and those from Fairfax County. Lmax noise levels from idling buses at passenger stations were predicted to range from below 20 dBA at a residence in McLean, to 51 dBA at the LaMadeleine Restaurant in Tysons Corner under the LPA. Similarly, project noise levels from parking facilities were expected to range from below the ambient background at receptors over 2,000 feet away, to 36 dBA at Moore Cadillac in Tysons Corner, which would be less than 750 feet away from the Tysons West station facilities. However, Lmax noise levels from facility activities associated with the new storage tracks at the West Falls Church S&I Yard are predicted to exceed the Fairfax County stationary noise criterion of 55 dBA at six residences in McLean. No other exceedances of the FTA or the WMATA facility criteria are predicted under the LPA.

D. Historic Resources

At all historic resources within the area of potential effect (APE), none of the predicted future noise levels are predicted to exceed the FTA or the WMATA impact criteria under the Wiehle Avenue Extension. However, at specific historic receptor locations, including Ash Grove historic site (29-2) and The Plantation (29-188), cumulative future ambient day-night noise levels under the Wiehle Avenue Extension are predicted to increase slightly by less than three dBAs. At the Lewinsville Post Office, cumulative future noise levels are not predicted to change from the existing ambient levels.

4.7.5.3 Full LPA

A. FTA Criteria

Under the full LPA, Metrorail service would operate from the Orange Line Connection near West Falls Church to Dulles Airport and beyond to Route 772 in Loudoun County. However, as shown in Tables 4.7-3, the total number of receptor locations where project noise levels are predicted to exceed the FTA Land-Use Category 2 *impact* criteria is predicted to decrease slightly from 174 under the Wiehle Avenue Extension to 173 under the full LPA. The number of residential locations where project noise levels are predicted to exceed the FTA Land-Use Category 2 *severe impact* criteria is predicted to remain unchanged at 10 under the full LPA. This reduced number of impacts under the LPA is due primarily to the elimination of idling express buses at the station.

B. WMATA Criteria

As shown in Table 4.7-5, the total number of receptor locations where maximum project passby noise levels are predicted to exceed the WMATA impact criteria is predicted to increase slightly from 46 residences under the Wiehle Avenue Extension to 47 under the full LPA. This increase of one WMATA impact (The Launders Historic House) between the Wiehle Avenue Extension and the full LPA is due to Metrorail operations that occur west of Wiehle Avenue. The number of WMATA impacts at commercial receptors remains unchanged at two locations under the full LPA.

In the vicinity of stationary sources, Lmax noise levels from facility activities associated with the new storage tracks at the West Falls Church S&I Yard are also predicted to exceed the Fairfax County stationary noise criterion of 55 dBA at six residences in McLean under the full LPA. However, project noise levels from S&I Yard Site 15 in Loudoun County, such as wheel squeal, are also not predicted to exceed the selected Project criteria limits at any nearby receptor locations under the full LPA.

C. Historic Resources

As discussed for the Wiehle Avenue Extension, the full LPA predicted noise levels would not exceed FTA or WMATA criteria at historic resources within the APE. The Launders House (29-240) would experience a noise level of 58 dBA. However, at the house on Route 643 (53-23), cumulative future ambient day-night noise levels under the full LPA are predicted to increase slightly.

D. FHWA Criteria

Due to the proposed realignment of the DIAAH, the Dulles Toll Road and the Dulles Greenway at all stations west of Tysons Corner, peak-hour traffic noise levels were compared with the FHWA Noise Abatement Criteria. Although future peak-hour Leq noise levels under the full LPA are expected to approach or exceed the FHWA Land-Use Category C criterion of 72 dBA at several commercial receptor locations, there is no change from the existing noise levels. Due to the negligible change in noise levels between the existing condition and the future Build Condition, there are no exceedances of the VDOT “substantial increase over existing” criterion predicted under the Full LPA.

4.7.6 CONSTRUCTION EFFECTS

Noise levels from construction activities along the Dulles Corridor, although temporary, could create a nuisance condition at nearby sensitive receptors. Exposure to excessive noise levels varies depending on the types of construction activity and the types of equipment used for each stage of work. Project construction activities would include track-laying, station construction, bridge rehabilitation, feeder bus

facility construction, and parking garage construction. The following subsections describe the predicted noise levels and potential noise impacts associated with the project construction activities.

4.7.6.1 No Build Alternative

The No Build Alternative includes changes to the operating characteristics of the existing transportation network separate from the Dulles Corridor Rapid Transit Project. Therefore, a construction impact assessment was not conducted for the No Build Alternative.

4.7.6.2 Wiehle Avenue Extension

Under the Wiehle Avenue Extension, guideway construction activities would occur from the Orange Line Connection to Wiehle Avenue Station only. Construction activities would also include Metrorail stations, express bus stops, bridges, parking garages and feeder bus facilities. The distances at which an exceedance of the FTA daytime noise limits of 90 dBA at residential receptors is predicted range from 32 feet during station construction to 40 feet during at-grade guideway construction. The distances at which an exceedance of the FTA daytime noise limits of 100 dBA at commercial receptors would occur range from 10 feet during station construction to 13 feet during at-grade guideway construction. As a result, construction activities are not predicted to exceed the FTA daytime noise limits anywhere along the Project corridor.

The distances at which an exceedance of the WMATA daytime noise limits of 75 dBA at residential receptors as predicted range from 182 feet during at-grade guideway construction to 223 feet during aerial track construction. The distances at which an exceedance of the WMATA daytime noise limits of 80 dBA at commercial receptors as predicted range from 102 feet during guideway construction to 126 feet during aerial guideway construction. As a result, noise levels from any cut-and-cover construction activities under the Wiehle Avenue Extension are predicted to exceed the WMATA daytime noise limits at 3 commercial receptor locations in Tysons Corner. These receptors include a bank at the corner of Gosnell Road and Leesburg Pike, a Wendy's restaurant on Leesburg Pike and a hotel at the corner of International Drive and Chain Bridge Road.

4.7.6.3 Full LPA

The total number of construction noise impacts under the full LPA is predicted to be the same as those reported for the Wiehle Avenue Extension. Construction activities are not predicted to exceed the FTA daytime noise limits anywhere along the project corridor under the full LPA. However, noise levels from any cut-and-cover construction activities under the full LPA are predicted to exceed the WMATA daytime noise limits at 3 commercial receptor locations in Tysons Corner: a bank and a Wendy's restaurant along Route 7, and a hotel at the corner of International Drive and Chain Bridge Road.

4.7.7 MITIGATION

Proposed measures to mitigate noise impacts associated with the Wiehle Avenue Extension and the full LPA are described below. These mitigation measures would be refined during preliminary engineering and/or final design.

4.7.7.1 Operations

Three-foot parapets are proposed along all aerial Metrorail Sections (except on Airport property). To mitigate further long-term noise effects from Metrorail operations, four- to six-foot parapet and trackside barriers would be installed along the alignment at the locations and heights shown in Table 4.7-6 and Figure 4.7-5. Due to two single crossovers just west of Pimmit Run in McLean (related to TBS-2), 4-foot

parapet barriers will be extended 1,000 feet from Sta. No. 800+00 to 810+00 on the outbound side. This barrier is intended to reduce noise from Metrorail passbys over the rail discontinuities due to the pair of switches at Sta. Nos. 803+00 and 806+00. The new lead track and existing loop track at the West Falls Church Yard would be enclosed to reduce wheel squeal noise impacts from yard operations. In addition, the DRPT and WMATA would analyze reflective highway noise impacts to the Hallcrest Heights residential community during preliminary engineering or final design.

Table 4.7-6: Recommended Location and Dimensions of Aerial Parapets and At-Grade Barriers

Station Location	Height[1]	Length	Type	Alternative
Outbound side of the Metrorail Corridor				
Sta. No. 474+00 to 480+00	4 ft	600 ft	At Grade	Wiehle & LPA
Sta. No. 730+00 to 734+00	6 ft	400 ft	At Grade	Wiehle & LPA
Sta. No. 743+00 to 756+00	4 ft	1,300 ft	At Grade	Wiehle & LPA
Sta. No. 764+00 to 779+00	4 ft	1,500 ft	Aerial	Wiehle & LPA
Sta. No. 780+00 to 785+00	6 ft	500 ft	Aerial	Wiehle & LPA
Sta. No. 796+00 to 810+00	4 ft	1,400 ft	At Grade	Wiehle & LPA
Sta. No. 830+00 to 867+00	4 ft	3,700 ft	At Grade	Wiehle & LPA
Sta. No. 1028+00 to 1045+00	4 ft	1,700 ft	Aerial	Wiehle & LPA
Sta. No. 1121+00 to 1140+00	4 ft	1,900 ft	At Grade	Wiehle & LPA
Sta. No. 1194+00 to 1200+00	4 ft	600 ft	At Grade	Wiehle & LPA
Sta. No. 1242+00 to 1246+00	4 ft	400 ft	At Grade	Wiehle & LPA
Sta. No. 1520+00 to 1540+00	4 ft	2,000 ft	At Grade	Wiehle & LPA
Inbound side of the Metrorail Corridor				
Sta. No. 483+00 to 486+00	6 ft	300 ft	At Grade	Wiehle & LPA
Sta. No. 731+00 to 735+00	6 ft	400 ft	At Grade	Wiehle & LPA
Sta. No. 770+00 to 785+00	4 ft	1,500 ft	Aerial	Wiehle & LPA
Sta. No. 790+00 to 792+00	4 ft	200 ft	At Grade	Wiehle & LPA
Sta. No. 793+00 to 810+00	6 ft	1,700 ft	At Grade	Wiehle & LPA
Sta. No. 813+00 to 849+00	4 ft	3,600 ft	At Grade	Wiehle & LPA
Sta. No. 855+00 to 863+00	6 ft	800 ft	At Grade	Wiehle & LPA
Sta. No. 864+00 to 882+00	4 ft	1,800 ft	Aerial	Wiehle & LPA
Sta. No. 1015+00 to 1040+00	4 ft	2,500 ft	Aerial	Wiehle & LPA
Sta. No. 1117+00 to 1140+00	4 ft	2,300 ft	At Grade	Wiehle & LPA

[1] Proposed barrier height determined by mitigation analysis measured from top of rail. Actual barrier height as measured from outside of structure will conform to WMATA design criteria (52 or 76 inches).

4.7.7.2 Construction Activity

During construction, DRPT would comply with noise limits established by FTA and WMATA guidelines, Federal law (for Wolf Trap Farm Park), and time-of-day restrictions specified in local noise ordinances. If necessary, temporary mitigation measures would be employed

4.8 VIBRATION

This section introduces some basic ground-borne vibration and ground-borne noise concepts, including the prediction methodologies and modeling assumptions used for the project, the results of the existing source vibration measurement program, and the evaluation of impacts in the study area.

4.8.1 HUMAN PERCEPTION OF VIBRATION

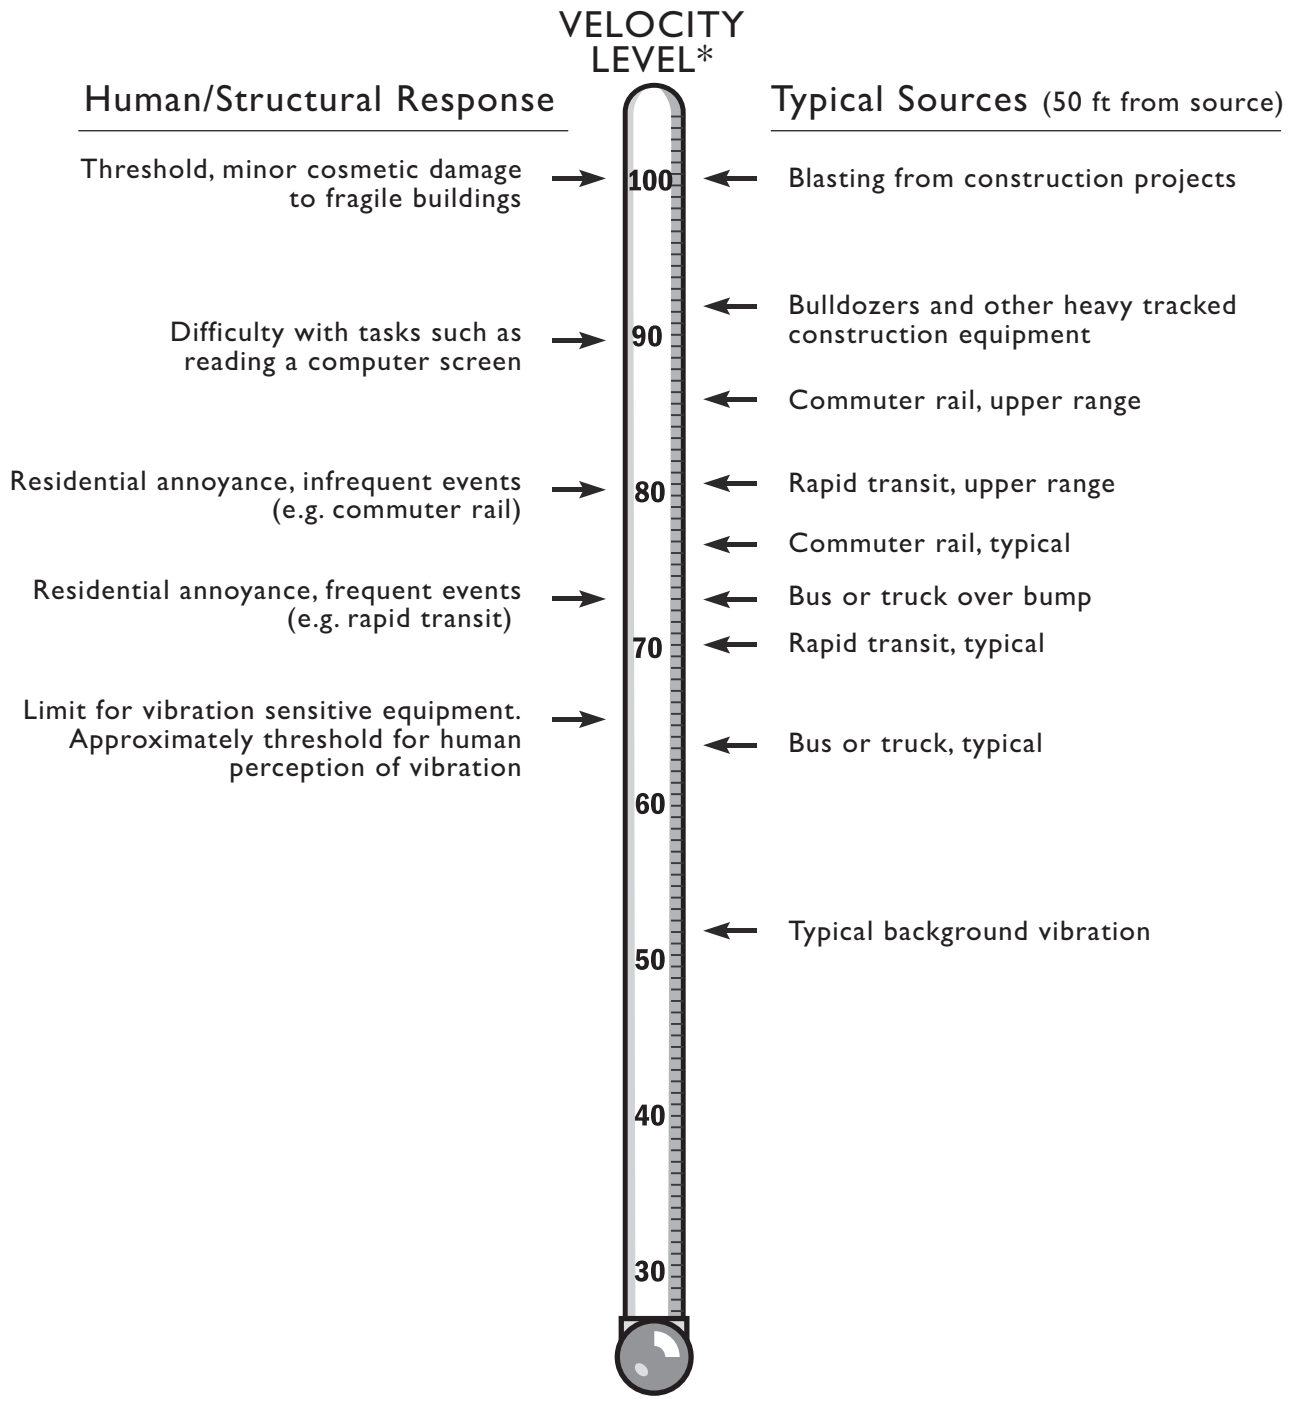
Ground-borne vibration associated with vehicle movements is usually the result of uneven interactions between the wheel and the rail surfaces. Examples of such interactions (and subsequent vibrations) include train wheels over jointed rail and an untrue railcar wheel with "flats."

Unlike noise, which travels in air, transit vibration typically travels along the surface of the ground. Depending on the geologic properties of the surrounding ground and the type of building structure exposed to transit vibration, vibration propagation may be more or less efficient. Similarly, ground-borne noise results from vibrating room surfaces located near a heavily traveled transit corridor, such as a subway line. Consequently, annoyance resulting from the "rumbling" sound of ground-borne noise is only evaluated indoors and is described using the A-weighted decibel.

Vibration induced by vehicle passbys can generally be discussed in terms of displacement, velocity, or acceleration. However, human responses and responses by monitoring instruments and other objects are more accurately described with velocity. Therefore, the vibration velocity level is used to assess vibration impacts.

Vibration is described using an average vibration amplitude called the root mean square (RMS) amplitude, which is used to assess impacts. The RMS velocity is expressed in inches per second (ips) or decibels (VdB). All VdB vibration levels are referenced to 1 micro inch per second (μips).

To evaluate the potential for damage to buildings, the peak particle velocity (PPV) is also used to characterize the vibration. Typically expressed in units of ips, PPV represents the maximum instantaneous vibration velocity observed during an event. Typical ground-borne vibration levels from transit and other common sources are shown in Figure 4.8-1.



4.8.2 EVALUATION CRITERIA

Both FTA and WMATA criteria are used to evaluate vibration from single-event transit passbys and construction activities.

4.8.2.1 Federal Criteria

The FTA vibration criteria for evaluating ground-borne vibration impacts from train passbys at nearby sensitive receptors are shown in Table 4.8-1. These vibration criteria are related to ground-borne vibration levels that are expected to result in human annoyance, and are based on RMS velocity levels expressed in VdB. The FTA's experience with community response to ground-borne vibration indicates that when there are only a few train events per day, it would take higher vibration levels to evoke the same community response that would be expected from more frequent events. This is taken into account in the FTA criteria by distinguishing between projects with frequent and infrequent events, where the frequent-events category is defined as more than 70 events per day. The vibration criteria levels shown in Table 4.8-1 are defined in terms of human annoyance for different land use categories such as high sensitivity (Category 1), residential (Category 2), and institutional (Category 3). In general, the threshold of human perceptibility of vibration is approximately 65 VdB.

* RMS Vibration Velocity Level in VdB relative to 10^{-6} inches/second

Figure 4.8-1

Typical Ground-Borne Vibration Levels

Dulles Corridor Rapid Transit Project

The vibration levels shown in Table 4.8-1 are well below the damage criteria levels of approximately 95 to 100 VdB. It is extremely rare for vibration from train operations to cause any sort of building damage, including minor cosmetic damage. The potential for damage from vibratory or impact devices are discussed further under the construction criteria.

Table 4.8-1: FTA Ground-Borne Vibration Impact Criteria for Annoyance

Receptor Land Use		RMS Vibration Levels (VdB)		Ground-Borne Noise Levels (dBA)	
Category	**Description**	**Frequent Events**	**Infrequent Events**	**Frequent Events**	**Infrequent Events**
1	Buildings where low vibration is essential for interior operations	65	65	n.a.[1]	n.a.[1]
2	Residences and buildings where people normally sleep	72	80	35	43
3	Daytime institutional and office use	75	83	40	48
Specific Buildings	TV/Recording Studios/Concert Halls	65	65	25	25
	Auditoriums	72	80	30	38
	Theaters	72	80	35	43

1. Not applicable. Vibration-sensitive equipment is not affected by ground-borne noise.
Source: *Transit Noise and Vibration Impact Assessment - Final Report*, Federal Transit Administration, Washington, D.C., April 1995.

While vibration criteria are generally used to assess annoyance from transit sources at the exterior facade of receptors, ground-borne noise, or the rumbling sound due to vibrating room surfaces, is typically assessed indoors. In general, the relationship between vibration and ground-borne noise depends on the dominant frequency of the vibration and the acoustical absorption characteristics of the receiving room. Typical soil conditions were assumed everywhere along the corridor for computing ground-borne noise.

4.8.2.2 WMATA Criteria

Similar to the FTA criteria, the WMATA vibration and ground-borne noise criteria were developed for various community land use categories, as well as for specific building types. As shown in Table 4.8-2, the WMATA criteria were used to assess impacts from single event passbys for the full LPA.

Table 4.8-2: WMATA Criteria for Single Event Maximum Vibration and Ground-Borne Noise from Metrorail Operations

Community Area Category		RMS Vibration Levels (VdB)[1]			Ground-Borne Noise Levels (dBA)[1]		
		SFAM	MFAM	COM	SFAM	MFAM	COM
I	Low-density Residential	70	70	70	30	35	40
II	Average Residential	70	70	75	35	40	45
III	High-density Residential	70	75	75	35	40	45
IV	Commercial	70	75	75	40	45	45
V	Industrial/Highway	75	75	75	40	45	50
Specific Building Types		**RMS Vibration Levels (VdB)**			**Ground-Borne Noise Levels (dBA)**		
Concert Halls, Television Studios		65			25		
Auditoriums and Music Rooms		70			30		
Church, Theaters, and Hospitals		70			35

1. Land use categories include single-family (SFAM), multi-family (MFAM), and commercial (COM) receptors.
2. Not applicable. Industrial buildings and laboratories are not sensitive to ground-borne noise.
Source: WMATA Noise and Vibration Design Criteria (2001).

4.8.2.3 Construction Criteria

Vibration impacts due to construction activities were assessed using the FTA and the WMATA criteria to determine the onset of annoyance and structural damage. The vibration levels shown in Table 4.8-1 were used to evaluate vibration annoyance according to the FTA from various construction scenarios expected in the study area. Additionally, although damage is unlikely, the recommended FTA criteria limits that were used to assess minor structural damage, such as small cracks in plaster walls, in PPV are 0.20 ips for fragile buildings and 0.12 ips for extremely fragile or older historic buildings.

Unlike the FTA criteria, the WMATA criteria utilize PPV vibration levels that range from 0.03 ips for sustained construction activities of more than one hour per day to 0.10 ips for intermittent activities that occur less than 10 minutes per day. The WMATA limits are used to evaluate the potential for annoyance and interference to occupants of affected buildings.

4.8.3 METHODOLOGY

Vibration levels from Metrorail passbys, as well as during construction, at sensitive receptors in the study area were determined using the FTA guidelines. Railcar passbys along continuously welded rail track and rail discontinuities, such as switches and crossovers, were the dominant source of vibration in the modeling analysis. Due to their lighter weight and slower speeds, vibration levels from Express Buses are predicted to be well below the ambient level at all receptors located between Wiehle Avenue and Route 772 in Loudoun County.

A vibration measurement program was conducted to better determine the extent of ground-borne vibration levels from existing Metrorail trains as well as provide insight into the type of soil conditions found in the study area. The results of the measurement program are discussed in Section 4.8.4.

Changes to the vibration modeling assessment between the Draft, the Supplemental Draft and the Final EIS include revised switch locations, updated travel speeds, and modifications affecting the alignment relocation and elevation.

4.8.4 EXISTING CONDITIONS

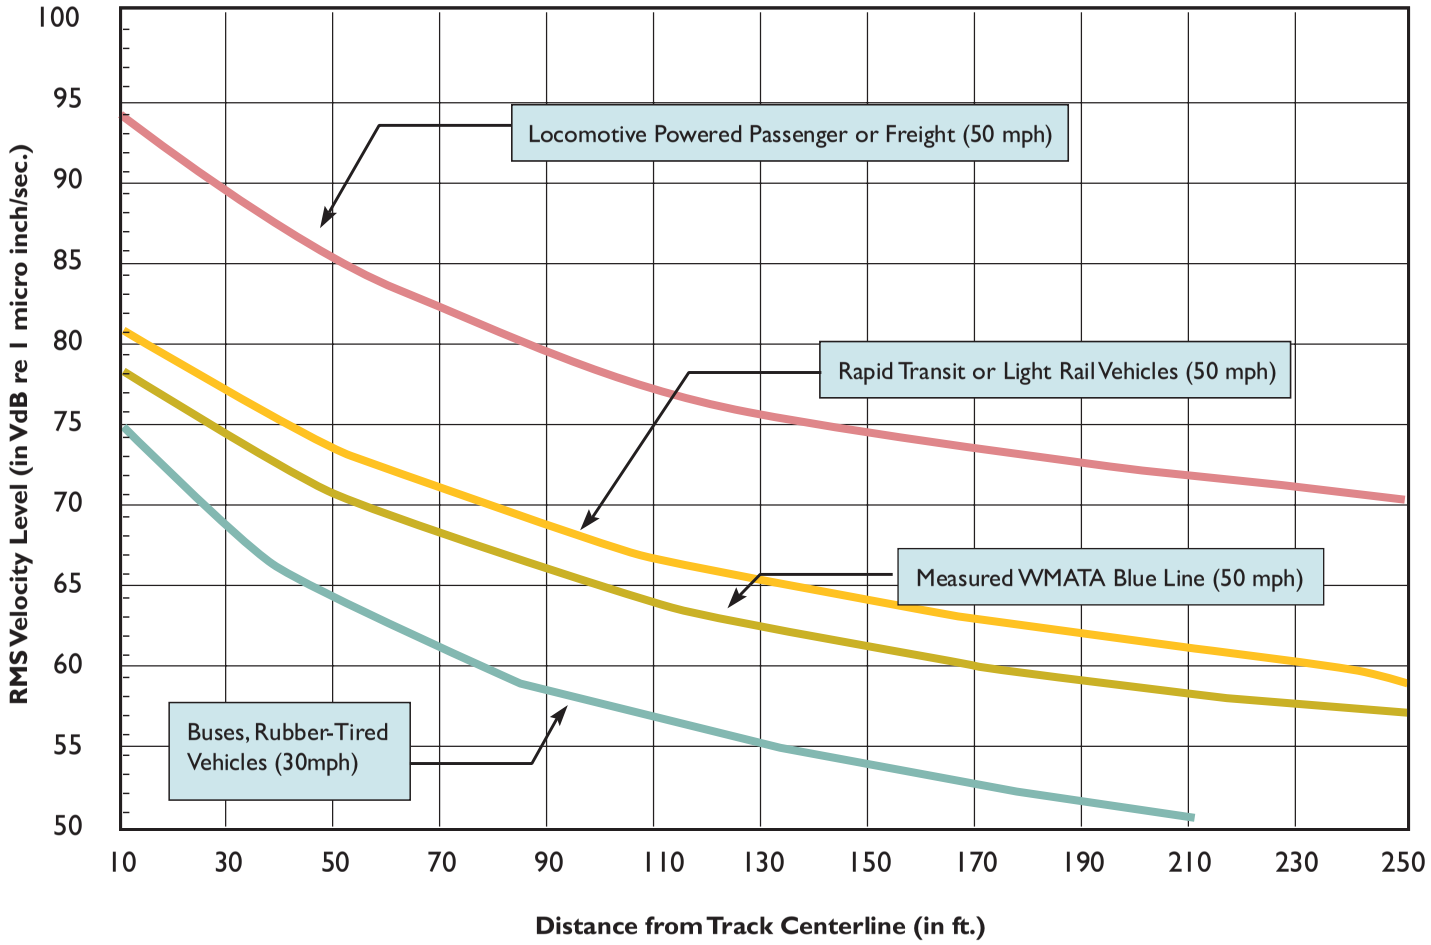
Vibration measurements were conducted along an existing Metrorail line to determine the vibration propagation characteristics of the existing terrain and the vibration levels of a Metrorail train passby. These reference vibration levels were used to provide a more detailed understanding of the ground propagation characteristics in the study area. These measurements were also used to supplement the vibration curves contained in the FTA guidelines. As shown in Figure 4.8-2, the ground-surface propagation curves developed from the measured data observed along the Metrorail Blue Line near Arlington Cemetery Station are approximately 3 VdB lower than the FTA curve for rapid transit vehicles. However, due to the difficulty in determining the wave propagation characteristics everywhere along the study area, the FTA surface curves were used in the modeling prediction to provide a slightly more conservative estimate than was actually measured.

4.8.5 LONG-TERM EFFECTS

Vibration impacts from Metrorail vehicles and express buses were evaluated at discrete receptors using the FTA and WMATA criteria based on maximum single event passbys as described in the following sections (see Figure 4.8-3). Unlike the cumulative noise criteria, vibration criteria are evaluated based on single-event passbys. The results of the impact assessment are described in the following sections.

4.8.5.1 No Build Alternative

In accordance with FTA guidelines, vibration impacts are only assessed from new proposed vibration sources such as Metrorail passbys. Under the No Build Alternative, the full LPA would not be completed along the Dulles Corridor. Therefore, because no new sources of vibration are expected under the No Build Alternative, a vibration impact assessment is not required. Existing sources that contribute to the ambient background vibration level include motor vehicles, buses, trucks and other ongoing construction activities along the Dulles Corridor.



4.8.5.2 Wiehle Avenue Extension

The results of the vibration and ground-borne noise assessments for the Wiehle Avenue Extension are described in the following sub-sections.

A. FTA Criteria

Under the Wiehle Avenue Extension, new continuously welded rail track is proposed from the Orange Line to Wiehle Avenue. Most of the track alignment would be at grade in the median of a roadway, or elevated to accommodate the existing roadways and cross streets. In general, elevated track provides additional attenuation from train passbys due to the mass of the track structure itself, no direct track-to-soil coupling, as well as the extra distance that the vibration must travel between the source and the receptor.

0 3000 6000 Feet

Figure 4.8-3

Potential FTA/WMATA Vibration & Ground-Borne Noise Impact Locations

Dulles Corridor Rapid Transit Project

Predicted vibration levels are expected to be well below the FTA frequent events impact criteria at most of the FTA Land Use Category 1, 2, or 3 receptors identified in the study area. For example, predicted RMS vibration levels from Metrorail passbys are expected to range from well below the ambient background level of 15 VdB at several receptors to 58 VdB at a residence at Hallcrest Heights in McLean to 66 VdB at Moore Cadillac in Tysons Corner. These levels are below the FTA impact criteria of 65 and 75 VdB, respectively. However, due to the location of switches and crossovers, RMS vibration levels from Metrorail passbys are predicted to exceed the FTA Land Use Category 2 impact criteria at up to six residences in the Orange Line Connection area and the FTA Land Use Category 3 impact criteria at one non-residential receptor in Tysons Corner (The Business Bank on Route 7). No exceedances of FTA Land Use Categories 1 are predicted anywhere under the Wiehle Avenue Extension.

Similarly, maximum ground-borne noise levels due to Metrorail passbys are expected to range from less than 20 dBA at a residence in Reston to 31 dBA at Moore Cadillac in Tysons Corner. Ground-borne noise levels are predicted to exceed the FTA Land Use Category 2 impact criteria at up to 14 residences located adjacent to track switches in the Orange Line Connection. Similarly, ground-borne noise levels are predicted to exceed the FTA Land Use Category 3 impact criteria at only one location, The Business Bank in Tysons Corner along Route 7. There are no exceedances of FTA Land Use Category 1 impact criteria predicted anywhere along the corridor under the Wiehle Avenue Extension.

Due to their light weight and large distance between the closest receptors and the proposed median alignment, vibration levels from Express Bus passbys (at the maximum speed of 35 mph during the off-peak) are not predicted to exceed the FTA impact criteria at any residence.

B. WMATA Criteria

The same peak passby ground-borne vibration and noise levels used to assess impact according to the FTA criteria were also used to assess impacts using the WMATA criteria. As a result, up to 14 exceedances of the WMATA RMS vibration design criteria are predicted at residential receptors along the Orange Line Connection under the Wiehle Avenue Extension. Similarly, RMS vibration levels are predicted to exceed the WMATA commercial receptor impact criteria at only one location, The Business Bank in Tysons Corner along Route 7. Similarly, ground-borne noise levels are also predicted to exceed the WMATA criteria at the same receptor locations as were reported for the RMS vibration levels.

Vibration levels from Express Bus passbys are not predicted to exceed the WMATA impact criteria at any residence.

C. Project Facilities

Due primarily to distance and low impact activities, ground-borne vibration and ground-borne noise levels from activities at project facilities are expected to be well below the ambient background levels. Therefore, no exceedances of the FTA or the WMATA impact criteria are expected at project facilities under the Wiehle Avenue Extension.

D. Historic Resources

Vibration levels from Metrorail passbys near historic resources are predicted to range from well below the ambient background level of less than 15 VdB at several locations to 42 VdB at the Plantation along the DIAAH. These levels are all well below the FTA Land Use Category 1, 2, and 3 impact criteria. Similarly, ground-borne noise levels at historic resources are also not predicted to exceed the FTA Land Use Categories 1, 2, or 3 impact criteria under the Wiehle Avenue Extension. Predicted vibration levels are well below the threshold for minor cosmetic damage of 95 VdB.

4.8.5.3 Full LPA

All receptors where project vibration levels are predicted to exceed the FTA criteria limits are located east of Wiehle Avenue. Therefore, the results of the vibration impact assessment under the full LPA are the same as those reported for the Wiehle Avenue Extension.

4.8.6 CONSTRUCTION EFFECTS

Similar to noise, vibration levels from construction activities in the study area could also create a nuisance condition at nearby sensitive receptors. In addition to a nuisance condition, the potential for minor structural damage was also analyzed. Based on the vibration-monitoring program, average ground propagation characteristics were assumed as part of the vibration modeling assessment. Vibration levels were determined for the same scenarios selected for the noise assessment including track-laying, station, bridge, parking garage, feeder bus bays and rail yard construction.

4.8.6.1 No Build Alternative

No construction activities are proposed as part of the Dulles Corridor Rapid Transit Project under the No Build Alternative. Furthermore, because the FTA guidelines do not require a modeling impact assessment for the No Build Alternative, a construction vibration impact assessment was not conducted.

4.8.6.2 Wiehle Avenue Extension

Vibration impacts from proposed construction activities were evaluated for the Wiehle Avenue Extension and are discussed in the following subsections using the FTA and the WMATA impact criteria.

A. FTA Criteria

Under the Wiehle Avenue Extension, passenger stations and track would be constructed to accommodate Metrorail service between the Orange Line connection and Wiehle Avenue. Maximum RMS vibration levels from track laying construction activities are expected to range from less than 50 VdB at residences along Westpark Drive in Tysons Corner to 69 VdB at Hallcrest Heights in McLean to 79 VdB at Moore Cadillac in Tysons Corner. Although most of these levels are well below the FTA impact criteria, several exceedances of the FTA residential (72 VdB) and institutional (75 VdB) annoyance impact criteria are predicted. All predicted vibration levels from construction activities under the Wiehle Avenue Extension are well below the threshold for minor cosmetic damage of 95 VdB.

Based on the construction equipment selected, exceedances of the FTA vibration RMS criteria are predicted at 20 residences and 6 non-residential receptors during track construction under the Wiehle Avenue Extension. No other exceedances of the FTA impact criteria are predicted in the study area.

B. WMATA Criteria

The distance at which an exceedance of the WMATA damage criteria is predicted to occur ranges from 21 feet for bridge construction during intermittent construction activity to 97 feet during sustained activities. No exceedances of the WMATA vibration damage criteria are predicted at any sensitive receptors under any of the prototypical construction scenarios.

4.8.6.3 Full LPA

The receptors where vibration levels are predicted to exceed the FTA construction annoyance criteria limits are located east of Wiehle Avenue under the Wiehle Avenue Extension. Therefore, the results of the construction vibration impact assessment under the full LPA are the same as those reported for the Wiehle Avenue Extension.

4.8.7 MITIGATION

Utilization of dampening materials or devices under switches and crossovers are proposed to reduce vibration impacts from Metrorail operations. The final locations for these mitigation measures would be determined during preliminary engineering and/or final design consistent with WMATA criteria.

During construction, DRPT would use construction methods that minimize vibration and comply with any local regulations governing vibration.

4.9 HAZARDOUS AND CONTAMINATED MATERIALS

This section describes the potential for discovering hazardous or contaminated materials during implementation of the project, and presents a summary of the recommendations to determine the extent of any suspected contamination and mitigation measures.

Hazardous and contaminated materials evaluations were completed in 2001 and 2003 for the No Build Alternative and the full LPA. The results of the studies are summarized in this section and documented in detail in the *Hazardous and Contaminated Materials Technical Report* (June 2002) and the *Phase I Environmental Site Assessment* (November 2003). The hazardous materials evaluations were conducted in accordance with the scope and limitations of the American Society for Testing and Materials (ASTM) Standard for Environmental Site Assessments: Phase 1 Environmental Site Assessment Process (E-1527-00).

4.9.1 METHODOLOGY

The principal objective of the hazardous materials evaluations was to identify recognized environmental conditions in the Dulles Corridor relative to the ASTM Standard.

To identify recognized environmental conditions, a Phase I Environmental Site Assessment was conducted for the study area. A Phase I assessment is intended to permit a user to satisfy one of the requirements to qualify for the innocent landowner defense to the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended (CERCLA, commonly known as Superfund) liability; that is, the practices that constitute “all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice.”

Recognized environmental conditions (RECs) within the study area were identified and evaluated by reviewing regulatory database files and VDEQ files to obtain detailed information regarding spills, violations, contamination, and status of remediation activities reported in database files. Publications, maps, and reports about the surficial natural features of the study area prepared by the USGS, Northern Virginia Soil and Water Conservation District, and the Loudoun County office of the Natural Resources Conservation Service (NRCS) were also reviewed.

Historical aerial photographs of the area surrounding the proposed alignments, dated 1957 and 1962, 1967, 1974, 1981, and 1991, and historical topographic maps dated from 1956 to 1994;

Field surveys and site visits to confirm the sites listed in the database files, and to identify any additional sites, focusing on properties with the potential to contain underground storage tanks (USTs), petroleum contamination, and/or hazardous materials use, storage, or disposal;

A drive-by reconnaissance of the corridor and accessible adjoining properties was made to observe signs of spills, stressed vegetation, evidence of the presence of buried tanks or buried waste, subsidence, unusual soil discolorations, or any other unnatural items that may indicate the possible presence of environmental impacts on the properties;

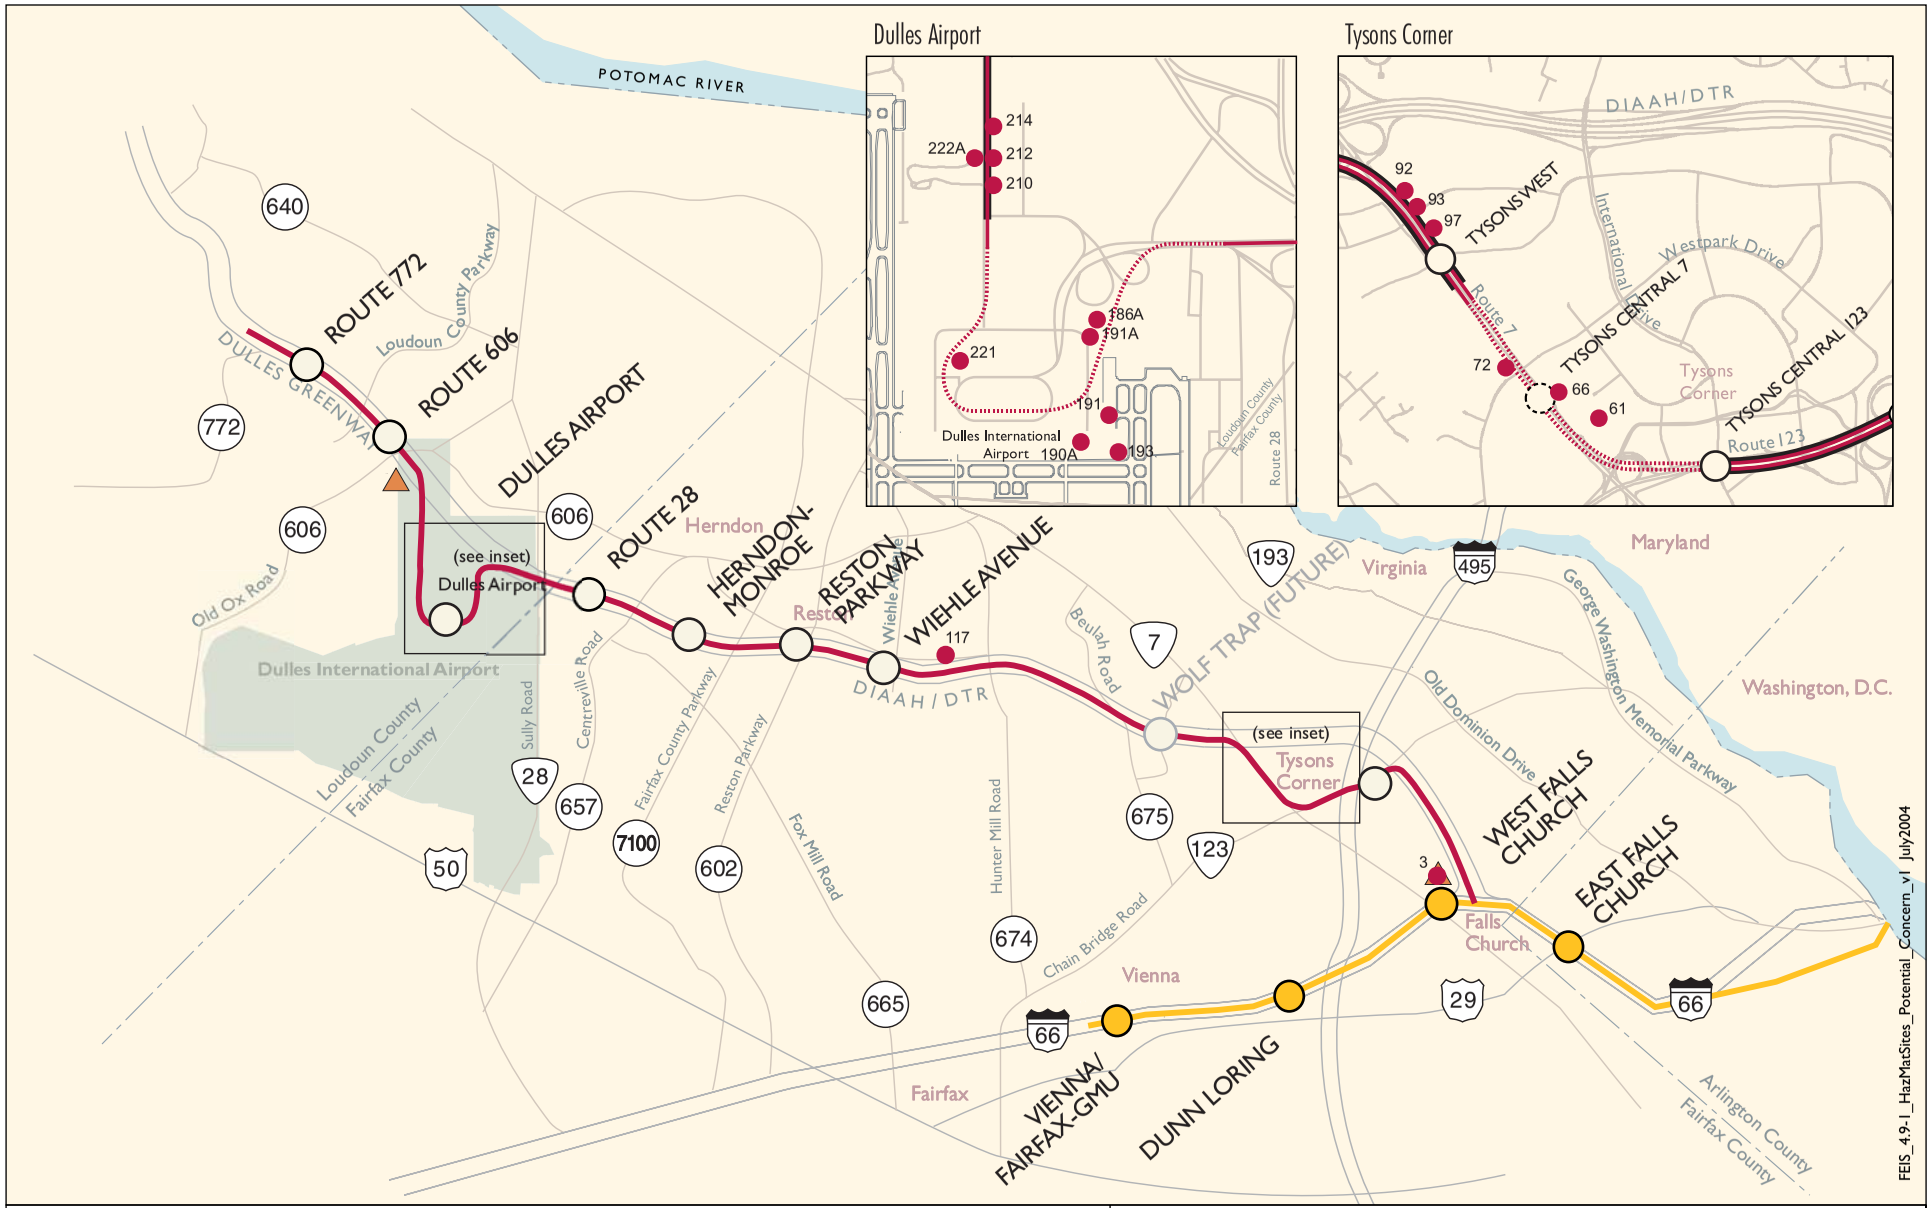
Photographs of sites were taken to document features such as unusually discolored soil, stressed vegetation or other significant features and available property owners and people familiar with the sites were interviewed.

The study area for hazardous and contaminated materials was determined as a 600-foot wide corridor that included the Dulles Connector Road, DIAAH and Dulles Toll Road, and Dulles Greenway, expanded to widths of 800 to 2,000 feet, where appropriate and to encompass proposed facilities. The study area for these activities is based on the ASTM Standard, except for the Tysons Corner area, Dulles Airport, and S&I Yard Site 15. In the Tysons Corner area, the database search was expanded to include all of the area within Tysons Corner, which includes the roughly triangular area with the DIAAH and Dulles Toll Road as the northern boundary, Route 123 and I-495 as the eastern boundary, and Route 7 as the western boundary. The database search area for Dulles Airport was also expanded to include all of the airport property, which extended from the Dulles Greenway to Route 50. For S&I Yard Site 15, a location adjacent to the site, the intersection of Mercure Circle and Quicksilver Drive was chosen, and the search extended two miles from this location.

A total of 236 sites of potential concern were initially identified for the study area in the preliminary assessment. However, not all sites identified on the Environmental Data Report (EDR) report were considered sites of potential concern. After reviewing the locations of these sites in relation to the initial project alternatives and the approximate limits of disturbance (LOD) for each, the list was refined to 28 sites.

To complete the Phase I ESA, the project team conducted another general reconnaissance of the Dulles Corridor, interviews with persons familiar with the sites including Metropolitan Washington Airports Authority (MWAA) personnel at Dulles Airport, and site visits and VDEQ file reviews for each of the 28 identified sites of potential concern for the Metrorail Alternative on Alignment T6. Based on new information provided by MWAA, seven additional RECs were identified as potentially affecting the project.

For the Wiehle Avenue Extension and the full LPA, the project team conducted additional field reconnaissance (windshield survey) in the spring of 2003 to confirm the existence of all reported sites and additional sites identified during the review of historic information. During the reconnaissance, several sites were identified within the study area that were not listed in the EDR reports but, based on professional judgment, are likely to contain RECs including gasoline stations, automobile dealerships, and areas with visible debris and garbage piles. To further ensure comprehensive site identification, the project team conducted a review of the Property Identification Plans in November 2003. Sites with recognized environmental conditions were then screened so that the list contained only sites of potential concern with respect to the construction of the project. This screening process is detailed in the *Phase I Environmental Site Assessment* (November 2003).



4.9.2 EXISTING CONDITIONS

Eighteen sites of potential concern were identified for the full LPA. The sites are presented in Table 4.9-1 and the locations of these sites are shown on Figure 4.9-1. These sites are recommended for further evaluation.

Table 4.9-1: Environmental Sites of Potential Concern

Site No.	EDR Report Site Name	Address	EDR Database/Status
3	West Falls Church Metrorail Yard	7251B & 7305 Idylwood Road	RCRIS-SQG - No violations reported FINDS LUST - Investigation closed 12-10-93 UST - 3 Active, 2 Removed
61	Former Fletcher Transmission	8346 Leesburg Pike	LUST – Investigation closed VRP – Case closed 2002

Hazardous Materials Sites of Potential Concern

Dulles Corridor Rapid Transit Project

The hazardous and contaminated materials evaluation also identified asbestos-containing soils as a potential hazardous materials concern. Greenstone bedrock is a rock type known to contain naturally occurring fibrous asbestos minerals. Three soil types related to the greenstone bedrock were identified in a portion of the study area, as discussed in Section 4.1, and shown on Figure 4.1-2. These soils are found in the area to the north, south, and southeast of the DIAAH and Dulles Toll Road near Hunter Mill Road.

The findings of the hazardous and contaminated materials evaluation are based on preliminary information only and are not intended to replace more detailed studies such as individual site assessments and subsurface soil and groundwater investigations.

4.9.3 LONG-TERM EFFECTS

Long-term effects of the No Build Alternative, the Wiehle Avenue Extension, and the full LPA on hazardous and contaminated materials sites are described below. Of the 18 sites of potential concern identified, 11 could be affected by on-site construction activities and the remaining seven were identified to be adjacent to construction activity. Sites potentially affected by on-site construction are summarized in Table 4.9-2.

Table 4.9-2: Sites of Potential Concern Affected by On-Site Construction Activities

			Locally Preferred Alternative		
Site No.	Site Name & Address	No Build	Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)

4.9.3.1 No Build Alternative

Under the No Build Alternative, there would be no effects from hazardous materials sites related to the Dulles Corridor Rapid Transit Project. Implementation of improvement projects related to the No Build Alternative could result in impacts to sites with hazardous materials or contamination. Although there could be some long-term effects, the most substantial effects would be addressed during construction. If

contamination is encountered during construction of any of these improvements, then impacts are possible. These effects would be the responsibility of agencies and jurisdictions implementing the improvements.

4.9.3.2 Wiehle Avenue Extension

Four sites of potential concern have been identified between the East Falls Church Station and Wiehle Avenue that could be affected by on-site construction activities associated with the Wiehle Avenue Extension (See Table 4.9-2). Although there could be some long-term effects such as long-term remediation of contaminated sites, the most substantial impacts from sites with potential hazardous materials or contamination are short-term effects that would be handled during construction.

The following sites of potential concern have been identified as being adjacent to construction activities for the Wiehle Avenue Extension:

- Site No. 61, former Fletcher Transmission located at 8346 Leesburg Pike
- Site No. 92, Security Storage Company of Washington located at 8600 Leesburg Pike
- Site No. 93, HBL Porsche/Audi located at 8598 Leesburg Pike
- Site No. 97, Peacock Buick located at 8590 Leesburg Pike

As a result, site visits, sampling and analysis are recommended as part of construction efforts adjacent to these sites.

Under the Wiehle Avenue Extension, the West Falls Church S&I Yard would have some long-term effects, which would include the use, storage, and disposal of hazardous materials and waste generated by operations at the sites.

Three stormwater ponds (P-10, P-11, and P-12) and a substation (B-5) would be located near Hunter Mill Road. The soils in this area may contain naturally occurring fibrous minerals. Construction in these areas could result in exposure to contamination and/or hazardous materials found at these sites. All soil excavation in these areas should be coordinated with Fairfax County to determine the extent and exact locations of these soils.

There would be no effects to potential sites of concern west of Wiehle Avenue as a result of the Wiehle Avenue Extension.

4.9.3.3 Full LPA

In addition to the four sites of potential concern identified for the Wiehle Avenue Extension, seven sites of potential concern have been identified between Wiehle Avenue and the Route 772 Station (See Table 4.9-2) bringing the full LPA to a total of 11 sites that could be affected by construction activities. Although there could be some long-term effects such as long-term remediation of contaminated sites, the most substantial impacts from sites with potential hazardous materials or contamination are short-term effects that would be handled during construction.

In addition to the sites adjacent to construction activities for the Wiehle Avenue Extension, the following sites have been identified as being adjacent to construction activities for west of Wiehle Avenue:

- Site No. 190A, Utility Buildings B1 and B2 located at 45011 and 45021 Compass Court
- Site No. 193, Air BP located at 301 East Terminal Road
- Site No. 222A, Hangars A, B, and C located on Autopilot Drive

As a result, site visits, sampling and analysis are recommended as part of construction efforts adjacent to these sites.

The full LPA would pass near several sites of potential concern on Dulles Airport property. Since the Dulles Airport Station would be located underground, there is the potential for substantial impacts related to underground construction of this segment. According to VDEQ files and airport officials, there have been a number of past releases and small surface spills at Dulles Airport. Airport activities such as deicing, fueling, and maintenance could have resulted in contamination in the areas where the full LPA would be constructed. Soil sampling and analysis need to be conducted prior to construction.

Under the full LPA, the S&I Yard Site 15 would have some long-term effects, which would include the use, storage, and disposal of hazardous materials and waste generated by operations at the sites.

4.9.4 CONSTRUCTION EFFECTS

The presence of soil and/or groundwater contamination or the existence of hazardous materials within existing or proposed right-of-way can have an adverse impact on the cost and schedule to complete a transportation project. Contaminated groundwater drawn into the dewatering system during construction could require special treatment and permitting prior to disposal. Contaminated soil unearthed during construction could require treatment and disposal and would not be usable for backfilling operations. In addition, it could be necessary to notify contractors about contaminated sites if worker exposure to hazardous conditions is anticipated.

Construction impacts related to hazardous materials or contamination could result from activities occurring in proximity to generators of those materials, removal or excavation around tanks or underground hoists, and activities occurring in proximity to spill or release sites. Construction activities under the Wiehle Avenue Extension and the full LPA would require soil disturbance. Although all efforts would be made to identify contaminated sites prior to construction, unknown contaminated soils and/or groundwater could be encountered during construction. If unknown contaminated soils and/or groundwater is encountered or a release occurs, the unknown material should be identified through testing. Coordination with the Virginia Department of Environmental Quality (VDEQ) would then be required to determine appropriate mitigation.

Construction activities can also involve the use of hazardous materials. If these materials are handled, used, stored improperly, or accidentally spilled, it could result in adverse impacts to both human health and the environment.

4.9.5 MITIGATION

Contamination may be present at properties to be acquired in the Tysons Corner and Dulles Airport areas. DRPT would undertake Phase II investigations to determine the nature and extent of that contamination. Remediation may be required depending on the nature of the contamination. In completing Phase II investigations and remediation, DRPT would comply with applicable federal, state, and local environmental laws. All activities related to hazardous materials would be coordinated with the VDEQ, and, if required, the US EPA.

During construction, DRPT would comply with federal, state, and local regulations governing the use and handling of hazardous materials and obtain all necessary permits or approvals. A Hazardous Materials

Management Plan would be prepared for the use of any hazardous materials during construction activities. This plan would cover the proper storage, handling, and use of hazardous materials required during construction, as well as emergency response procedures for any hazardous material spills.

4.10 ENERGY

This section documents the impact of the project on transportation-related energy consumption in the Dulles Corridor. The methodology used to assess the energy consumption impacts of the project is outlined in the Federal Highway Administration (FHWA) report entitled *Energy and Transportation Systems*, (July 1983) and in the *Energy and Transportation* manual (Caltrans, 1983). The energy consumption factors used for each mode of transportation are from the *Transportation Energy Book: Edition 16*, 1996. This methodology is consistent with that described in the FTA's *Reporting Instructions for the Section 5309 New Starts Criteria* (April 2004).

The energy analysis calculates the direct and indirect energy expenditures that would be associated with the Dulles Corridor Rapid Transit Project. The limits of this regional energy analysis are the entire Metropolitan Washington Council of Governments modeling area, which includes portions of northern Virginia, suburban Maryland, and the District of Columbia.

Direct energy involves all energy consumed by vehicle propulsion and is presented in British Thermal Units (BTUs) and Barrels of fuel (Bbls). Indirect energy consumption involves the non-recoverable, one-time energy expenditure that would be used in constructing the physical infrastructure associated with the project.

4.10.1 EXISTING CONDITIONS

The Dulles Toll Road, an eight-lane, limited-access facility now carries about 120,000-vehicle trips daily. The current energy consumption for the region is 385,826,336 million BTUs (73,242,834 Bbls). Approximately 2,650,595,747 gallons of fuel are consumed annually in the region. Calculated current and future energy consumptions are based on vehicle miles traveled (VMT) estimates for the entire study corridor.

4.10.2 LONG-TERM EFFECTS

The long-term effects of the No Build Alternative and the full LPA on energy usage are described in the following sections. Energy usage estimates are based on forecast vehicular and Metrorail traffic volumes, speeds, and corridor lengths. Vehicle mix information was obtained from the MWCOG Urban Vehicle Miles Traveled (VMT) mix for the Maryland-Virginia-Washington, D.C. region. The estimated fuel consumption figures take into account expected future fuel efficiency improvements. Results of the direct energy analysis are discussed below and summarized in Table 4.10-1.

Table 4.10-1: Direct Energy Consumed

	No Build (2011)	No Build (2025)	Locally Preferred Alternative		
			Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Annual Roadway BTUs (including Bus) (millions)	435,817,129	503,407,067	434,018,340	502,990,335	499,876,839
Total Roadway Fuel Consumed (gallons)	3,032,826,230	3,503,180,706	3,020,308,559	3,500,280,688	3,478,836,614
Percent Change From No Build Alternative	-	-	-0.412	-0.083	-0.694
Annual Metrorail BTUs (millions)	5,405,695	6,341,108	6,025,752	6,969,868	7,371,585
Total Annual BTUs Consumed (millions)	441,221,824	509,748,175	440,044,091	509,960,204	507,248,427
Total Annual Bbls Consumed	76,072,728	87,887,616	75,869,671	87,924,173	87,456,625
Percent Change From No Build Alternative	-	-	-0.27	+0.04	-0.49

BTUs- British thermal units
Bbls- Barrels of fuel

4.10.2.1 No Build Alternative

Any impacts to energy resources that would occur as a result of existing or committed projects would be the responsibility of the agencies and jurisdictions implementing the improvements. The No Build Alternative reflects the condition for the region without the Dulles Corridor Rapid Transit Project and is used as the basis of comparison for the direct energy consumption associated with the proposed Build Alternatives. The direct energy estimate for the No Build Alternative in 2025 is 509,748,175 million BTUs (87,887,616 Bbls). An estimated 3,503,180,706 gallons of fuel would be consumed annually.

4.10.2.2 Wiehle Avenue Extension

The direct energy estimate for the Wiehle Avenue Extension is 440,044,091 million BTUs (75,869,671 Bbls) in the opening year 2011 and 509,960,203 million BTUs (87,924,173 Bbls) in 2025, slightly higher than the No Build Alternative. The variation between predicted direct energy estimates for the No Build Alternative and the Wiehle Avenue Extension is -0.27 percent in opening year 2011 and +0.04 percent in 2025. In 2025, an estimated 3,500,280,688 gallons of roadway fuel would be consumed annually.

4.10.2.3 Full LPA

The direct energy estimate for the full LPA is 507,248,423 million BTUs (87,456,625 Bbls) in 2025, slightly lower than the No Build Alternative. The variation in predicted direct energy estimates for the No Build Alternative and the full LPA is -0.49 percent for 2025. In 2025, an estimated 3,478,614,047 gallons of roadway fuel would be consumed annually.

4.10.3 CONSTRUCTION EFFECTS

Energy consumption associated with construction (indirect energy) was calculated for the full LPA and reflects the one-time, non-recoverable energy costs associated with the construction of Metrorail facilities and modifications to existing roadways. The indirect energy analysis was based on the number of lane-miles and track-miles proposed. This includes construction of surface, tunnel, and elevated roadway and track segments. These figures were then multiplied by construction energy factors which estimate the amount of energy necessary to extract raw materials, manufacture and fabricate construction materials,

transport materials to the work site and complete construction activities. Results of the indirect energy analysis are discussed below by alternative.

The indirect energy consumption associated with the Wiehle Avenue Extension would be approximately 879,874 million BTUs (151,687 Bbls), as shown in Table 4.10-2. The indirect energy consumption associated with the full LPA would be approximately 1,820,028 million BTUs (313,797 Bbls), as shown in Table 4.10-2.

Table 4.10-2: Indirect Construction Energy Consumption for the Full LPA

Annual Indirect Energy	No Build Alternative	Locally Preferred Alternative		
		Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
BTUs Consumed (millions)	n.a.	879,874	879,874	1,820,028
Bbl Consumed	n.a.	151,687	151,687	313,797

4.10.4 MITIGATION

No significant long-term increases in energy consumption are anticipated from the construction and operation of the project. Therefore, no mitigation measures are proposed.

5 ECONOMIC EFFECTS

This chapter describes the economic effects of the Wiehle Avenue Extension and full Locally Preferred Alternative (LPA) of the Dulles Corridor Rapid Transit Project on the local economies of Fairfax and Loudoun counties and on the broader Commonwealth of Virginia economy. The chapter also describes he potential effects on station area development under the planning and design guidelines for Fairfax and Loudoun counties. The sections of this analysis discuss the following topics:

Section 5.1 discusses the economic effects that project expenditures would have on Fairfax and Loudoun counties and the Commonwealth of Virginia in terms of increased employment and related economic effects relative to the No Build Alternative.

Section 5.2 presents the planning context for each station area. Information on the development character and any potential changes are presented.

Section 5.3 describes the station area development projected for the No Build Alternative, Wiehle Avenue Extension, and the Full LPA including projections of office, retail, hotel, industrial, institutional, and residential development. Opportunities for joint development at station locations are also discussed.

The alternative formerly known as "LPA Phase 1" in the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* has been renamed the Wiehle Avenue Extension in this Final EIS and is expected to begin operations in 2011. This change reflects the federal approach to the project's funding under the Federal Transit Administration's New Starts program. It will assure consistency among the environmental, engineering and financial documents during the project's development.

In the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* as well as this Final EIS, the term "full LPA" represents the Wiehle Avenue Extension and the second phase of the Dulles Corridor Rapid Transit Project. This second phase would extend west from Wiehle Avenue to Washington Dulles International Airport and Route 772 and is expected to begin operations in 2015.

The term "LPA", "proposed action", or "selected LPA" refers to both the Wiehle Avenue Extension and the full LPA collectively.

5.1 ECONOMIC CONDITIONS

As documented in Chapter 3 of this Final EIS, both Fairfax and Loudoun counties are experiencing population and employment growth that exceeds the national average. Growth in these counties is expected to continue through 2025. The project would provide increased accessibility to both residents and businesses within the Dulles Corridor and is expected to contribute to this growth. New transportation capacity could create competitive advantages for businesses located in the corridor. The LPA would also provide a critical intermodal connection in the region's transportation system by providing a transit link to

Washington Dulles International Airport (Dulles Airport). This connection would help support the airport's expansion plan and help it retain its status as an engine of economic activity in Northern Virginia.

The construction, operation, and subsequent market response to the availability of this improved level of transit service would influence economic activity in Fairfax and Loudoun counties, as well as the broader Commonwealth of Virginia. Building the requisite transit facilities would expand payrolls for the duration of the project's construction cycle. Operating the new transit service would also expand payrolls, but, unlike the one-time construction impacts, the new jobs required to operate and maintain the new line would be long-term recurring impacts. The construction and transit hiring associated with the project represent the direct effects of investment in the Dulles Corridor. The earnings of these newly-hired construction and transit workers would translate into a proportional increase in consumer demand as these workers purchase goods and services in the region. A further increase of new employment across a variety of industrial sectors and occupational categories is expected as employers hire to meet this increase in local consumer demand. This latter hiring represents the project's indirect impact.

The LPA is also expected to have positive effects on commercial and residential properties located near transit stations. As described in greater detail in Section 5.3, the LPA would contribute to greater economic development by encouraging or supporting higher-density residential and commercial land uses around transit stations. Past experience with the Metrorail system has demonstrated that transit investment has had positive effects on the residential and commercial development near the stations. It is expected that new development around station areas in the Dulles Corridor would also attract businesses from outside Fairfax and Loudoun counties, providing net economic benefits. New development activity has already been observed at several of the proposed station areas in the study area.

This section describes the anticipated employment, earnings and fiscal effects of the project. This analysis focuses on the net effects generated by new investment in the local economy resulting from two alternatives: (1) implementation of the Wiehle Avenue Extension, and (2) implementation of the full LPA. The two areas considered in this analysis include (1) the combined counties of Fairfax and Loudoun, and (2) the Commonwealth of Virginia. Impacts are reported for both regions; however, since Fairfax and Loudoun counties are located within the Commonwealth, the impacts for the two regions are not additive. The economic effects are estimated in terms of net output, employment, earnings, and the resulting fiscal impacts.

The economic impacts associated with construction, operation and maintenance expenditures for the Wiehle Avenue Extension and the full LPA are measured using regional multipliers from the U.S. Department of Commerce Bureau of Economic Analysis (BEA). Derived from the Regional Input-Output Modeling System, the so-called RIMS II multipliers measure the total change (direct + indirect effects) in output, employment, and earnings that results from an incremental change to a particular industry. Two sets of multipliers are used. The first set was constructed by BEA to reflect the combined Fairfax and Loudoun county economies. The Fairfax County portion of the multiplier includes the City of West Falls Church and City of Fairfax; BEA does not provide a Fairfax County only multiplier as the raw data does not permit this disaggretation. The second set of multipliers corresponds to the Commonwealth of Virginia's economy. The multipliers are based on the 1997 Benchmark Input-Output Table for the nation and 2001 regional accounts data; they represent the most updated version available at the time this analysis was prepared (prepared by BEA, August 2004).

Fiscal impacts are quantified by applying tax rate information obtained directly from the counties and the Commonwealth to the estimated changes in economic activity.

This analysis assumes that transportation network improvements included in the No Build Alternative are also included in the Wiehle Avenue Extension and full LPA (i.e., the Build Alternatives). Therefore, this section focuses only on the additional incremental economic impacts attributable to the Build Alternatives, i.e., the marginal differences between the future conditions under the No Build Alternative and the future conditions under implementation of the Build Alternative.

5.1.1 OUTPUT, EARNINGS, AND EMPLOYMENT EFFECTS FROM CAPITAL EXPENDITURES

Construction of the Wiehle Avenue Extension and the full LPA represents significant capital investment in the local economies of Fairfax and Loudoun counties. This spending would increase the employment, earnings and output for the duration of the construction process. Capital cost estimates/construction values for this analysis are presented in 2004 dollars, providing a common value for expenditures that are distributed over a number of years. The following section describes the project expenditures and anticipated economic impacts.

5.1.1.1 Capital Expenditures

The capital expenditures for construction of the Wiehle Avenue Extension is estimated to cost $1.3 billion (in 2004 dollars); construction of the full LPA would cost approximately $2.8 billion (2004 dollars). These cost figures are the gross capital expenditures for the two alternatives relative to the No Build Alternative.

Total capital expenditures are divided into four major categories. These include:

- General Construction: guideway elements, stations, yards and shops, sitework, systems, and contingencies;
- Vehicles: vehicle manufacturing and assembly;
- Right-of-Way (ROW): all rights-of-way, land and existing improvements; and
- Soft Costs: engineering and related services.

Table 5.1-1 summarizes the capital costs by expenditure activity for the Wiehle Avenue Extension and the full LPA.

Table 5.1-1: Summary of Capital Costs (in thousands, 2004 dollars)

Alternative	General Construction Cost [1]	Vehicles	Right-of-Way	Soft Costs	Total [2]
Wiehle Avenue Extension	$ 847,074	$167,266	$ 82,613	$234,399	$1,331,352
Full LPA	$ 1,877,464	$334,532	$106,061	$521,892	$2,839,948

[1] Includes Contingency Costs

[2] This table lists only the net capital expenditures for each alternative relative to the No Build Alternative.

Note: Values in this Table and hereafter are expressed in 2004 $ in order to provide a common reference for impacts that occur in different years. Source: WMATA.

The economic impact of these expenditures will vary significantly by activity and depends on the amount of locally produced goods and services embodied in the purchase. Construction goods and services will be purchased in the local economy. Although every building material required for the project is not produced locally, the RIMS II multipliers reflect the supplier linkages for the industry, and thus account for

this leakage from the local economy. Leakage represents purchases made by local suppliers from sources outside the region.

Vehicle purchases, by contrast, will not be purchased from the local economy. Fairfax and Loudoun counties do not produce transit vehicles, limiting the potential impact this purchase can have. Thus, as no local labor is used to produce the vehicles, no local impact generated by their purchase is realized. Although there is likely to be some assembly required upon delivery of the vehicles and it is possible that a component of the vehicle might be made by a Virginia supplier, these possibilities represent a negligible share of the vehicles' cost and are excluded from this analysis.

Right-of-Way expenditures shown above are for real property only; the transaction costs associated with these expenditures are included in the Soft Cost category. As there is no labor associated with the ROW expenditures, there is no economic impact to the pure land costs.

Soft Costs are purchased in the local economy and have an impact in the local economy.

In sum, there are two types of capital expenditures that are expected to impact the economy: General Construction and Soft Costs. The total expenditure on these two categories is anticipated to be $1.1 billion (2004 dollars) for the Wiehle Avenue Extension and $2.3 billion (2004 dollars) for the full LPA.

5.1.1.2 Funding Sources

In order to isolate the potential economic effects of the project to the local economy and the Commonwealth of Virginia, it is necessary to distinguish those resources that are new to the economy and that would not be invested in Fairfax and Loudoun counties but for the project, from those that would still be spent in the region with similar economic effects (for example, funds that would be allocated to other transportation construction projects in the region).

Tables 5.1-2a and 5.1-2b summarize the funding sources and amounts that are planned for the Wiehle Avenue Extension and the full LPA. They also indicate whether these funds represent new resources that are being invested in the region because of the project or whether instead they are existing funds that would have been spent on a transportation project somewhere in the region regardless of project implementation.

Table 5.1-2a: Summary of Funding Sources for the Wiehle Avenue Extension (in thousands, 2004 dollars)

Wiehle Avenue Extension			New or Existing Funding Source by Region	
Source	Amount (Thousands)	Funding Share	Fairfax and Loudoun Counties	Virginia
Federal 5309 New Starts	$ 665,676	50%	New	New
Virginia Transportation Act of 2000	$ 66,568	5%	New	Existing
Dulles Toll Road Revenues	$ 266,270	20%	Existing	Existing
Fairfax County Dulles Rail Transportation Improvement District	$ 332,838	25%	Existing	Existing
Total Funding	$1,331,352	100%	-----	-----

Source: DRPT

Table 5.1-2b: Summary of Funding Sources for the full LPA (in thousands, 2004 dollars)

Full LPA			New or Existing Funding Source by Region	
Source	Amount (Thousands)	Funding Share	Fairfax and Loudoun Counties	Virginia
Federal 5309 New Starts	$ 1,419,974	50.0%	New	New
Virginia Transportation Act of 2000	$ 62,479	2.2%	New	Existing
Dulles Toll Road Revenues	$ 647,508	22.8%	Existing	Existing
Fairfax County Dulles Rail Transportation Improvement District	$ 457,232	16.1%	Existing	Existing
Loudoun County Public Transportation Fund	$ 2,840	0.1%	Existing	Existing
Loudoun County Business Professional and Occupancy License Revenue Bonds	$ 133,478	4.7%	Existing	Existing
MWAA Passenger Facility Charges	$ 116,438	4.1%	Existing	Existing
Total Funding	$ 2,839,948	100.0%	------	------

Source: DRPT

In the tables above, Federal funds originate from outside the Commonwealth of Virginia; thus, they represent new resources. Since the Virginia Transportation Act of 2000 funds could be spent anywhere within the Commonwealth of Virginia, their commitment to the Dulles Corridor Rapid Transit project makes them a new source from the perspective of Fairfax and Loudoun counties, but an existing source from the Commonwealth as a whole. The remaining funding sources originate within the combined county region and Commonwealth and are considered existing revenue sources. Those sources are labeled "Existing" in the tables above and do not represent new resources.

There are two considerations in determining the capital cost impacts:

- Are the expenditures of the type likely to yield impacts in the local economy?
- Are the funds used to make those expenditures new resources for the region?

The capital costs representing expenditures that accrue to the region, (General Construction and Soft Costs), are adjusted to account only for new resources flowing into the region and expected to generate impacts within the region. Only funding levels that represent new resources flowing into the region generate impacts with implementation of the Build Alternatives. Table 5.1-3 shows the level of funding for the capital cost elements that would generate economic impacts within Fairfax and Loudon counties and the Commonwealth of Virginia. The expenditures with significant local labor content that would yield impacts on the local economy are derived from the data in Table 5.1-1 and represent the sum of expenditures on General Construction and Soft Costs for each alternative. The amount of funding that represents new resources for the region under each alternative is derived from Tables 5.1-2a and Table 5.1-2b and represents the sum of those sources designated as "new".

Table 5.1-3: Capital Costs Representing New Resources (in thousands, 2004 dollars)

Alternative	Expenditures That Impact Local Economy	New Resources for Fairfax and Loudoun Counties	New Resources for Virginia
Wiehle Avenue Extension	$1,081,473	$ 732,244	$ 665,676
Full LPA	$2,399,356	$1,482,453	$1,419,974

Source: WMATA and DRPT

For both the Wiehle Avenue Extension and the full LPA, the amount of funding that represents new resources for the region is less than the total of all capital expenditures expected to impact the local economy. Thus, every single dollar of new resources is expected to yield an impact.

As the amount of funding that represents "new funding" is less than the total amount required for General Construction, this analysis assumes that the New Funds are spent on general construction expenditures. This assumption does not bias the analysis as the multipliers for "construction" and for "professional, scientific, and technical services" (the multiplier that would be applied to the soft cost category) are similar, particularly for Fairfax and Loudoun counties, as shown in Table 5.1-4.

Table 5.1-4: Comparison of RIMS II Multipliers by Region

		Multiplier				
		Final Demand			Direct Effect	
Region	Industry	Output (dollars)	Earnings (dollars)	Employment (jobs)	Earnings (dollars)	Employment (jobs)
Virginia	Construction	2.2554	0.6750	20.9623	1.9795	2.1221
	Professional, scientific and technical services	1.9999	0.6875	17.0331	1.6648	2.2641
Fairfax and Loudoun Counties	Construction	1.5612	0.3352	10.1004	1.5542	1.6167
	Professional, scientific and technical services	1.5799	0.4560	10.3048	1.3701	1.6995

Source: Bureau of Economic Analysis, U.S. Department of Commerce

The interpretation of the multipliers shown in Table 5.1-4 is as follows. The construction industry is used as an example.

The Final Demand Output Multiplier represents the total dollar change in output that occurs in all industries for each additional dollar of output delivered to final demand by the construction industry.

The Final Demand Earnings Multiplier represents the total dollar change in earnings of households employed by all industries for each additional dollar of output delivered to final demand by the construction industry.

The Final Demand Employment Multiplier represents the total change in number of jobs that occurs in all industries for each $1 million of output delivered to final demand by the construction industry.

The Direct Effect Earnings Multiplier represents the total dollar change in earnings of households employed by all industries for each additional dollar of earnings paid directly to households employed by the construction industry.

The Direct Effect Employment Multiplier represents the total change in number of jobs in all industries for each additional job in the construction industry.

Applying the Final Demand Multipliers for the construction industry to the amount of new funding/resources that will be used for capital expenditures provides estimates of the net output, earnings and employment impacts generated by each alternative by region for the year 2025. The results are summarized in Table 5.1-5a and 5.1-5b. Note that these are one-time impacts that last for the duration of construction. One job is defined as a job for one person of one year's duration. As an example, a job for one person that had a duration of three years would be defined as three person-year jobs.

Table 5.1-5a: Net Effects of Construction Activity Upon Fairfax and Loudoun Counties

Alternative	No Build Alternative (2025)	Locally Preferred Alternative	
		Wiehle Avenue Extension (2025)	Full LPA (2025)

5.1.1.3 Long-Term Effects

There are no long-term effects associated with the economic impacts generated by capital expenditures as construction-related impacts solely last for the duration of the project's construction cycle.

A. No Build Alternative

The No Build conditions consist of the future economic conditions (employment, output and earnings) that would exist under the No Build Alternative. The economic analysis focused on the incremental differences between the No Build condition and implementation of the Wiehle Avenue Extension and full LPA.

B. Wiehle Avenue Extension

For Fairfax and Loudoun counties, the effect of construction spending for the Wiehle Avenue Extension would result in just over $1.14 billion in output (2004 dollars), over $245 million in earnings, and approximately 6,600 person-year jobs in Fairfax and Loudoun counties. Within the Commonwealth of Virginia, construction spending would result in $1.5 billion in output (2004 dollars), $449 million in earnings, and approximately 12,400 new person-year jobs.

C. Full LPA

For Fairfax and Loudoun counties, the effect of construction spending for the full LPA would result in $2.3 billion in output (2004 dollars), nearly $500 million in earnings, and approximately 13,400 new person-year jobs. Within the broader Commonwealth of Virginia, construction spending would result in $3.2 billion in output (2004 dollars), nearly $960 million in earnings, and approximately 26,600 person-year jobs.

5.1.2 OUTPUT, EARNINGS, AND EMPLOYMENT EFFECTS FROM OPERATIONS AND MAINTENANCE EXPENDITURES

Implementation of the project would create jobs and earnings as a result of ongoing operations and maintenance (O&M) expenditures. The projected O&M expenditures for the Wiehle Avenue Extension and full LPA are calculated for Metrorail service. This analysis assumes that funding for O&M would be procured from local government funds and project-generated funds, including:

- Local Government Funds: Washington Metropolitan Area Transit Authority (WMATA) Compact, benefit assessment districts, and/or Metropolitan Washington Airports Authority (MWAA) participation; and
- Project-Generated Funds: passenger fare revenue, joint development, parking revenues, and advertising and concessions income.

Although these expenses would originate from local sources, they represent spending that would not take place but for the implementation of service along the Wiehle Avenue Extension and full LPA. The expansion of transit service associated with the Build Alternatives represents an expansion of economic activity in the counties and Commonwealth, and thus generates recurring net economic impacts (long-term).

One potential source of federal funding for maintenance of the Build Alternatives is the Section 5307 Urbanized Area Formula Funds. These grants are applied to preventative maintenance, and could be used after the seventh year of operations. At this time, no Section 5307 funds have been allocated for maintenance for this project, and they are not assumed to be part of the operating funding plan, which is described in more detail in Chapter 8. If federal funds are applied to maintenance activities for the Build Alternatives, they could generate some additional net economic effects to the local and state economies through increased employment and earnings.

The estimate of full-time employees (FTE) and associated earnings required for the No Build Alternative, the Wiehle Avenue Extension and full LPA alternatives are shown in Tables 5.1-6a and Table 5.1-6b. The increased transit employment would result in positive economic impacts to Fairfax and Loudoun counties and the Commonwealth of Virginia, both through direct hiring to fill transit jobs and indirectly as these transit workers spend their earnings, thus creating additional consumer demand and jobs to meet that demand.

Because output measures are less reliable in the context of transit service where market prices are not available, this analysis uses the Direct Effect Multipliers as described above to generate estimates of the employment and earnings impacts attributable to O&M activities. The multipliers applied in this section of the analysis are for the industry labeled “transit and ground passenger transportation.” The wages shown in Table 5.1-6b are in 2004 dollars and represent total wages and salaries.

Table 5.1-6a: Net Employment Impacts from Operations and Maintenance Activities

Alternative	No Build Alternative (2025)	Locally Preferred Alternative	
		Wiehle Avenue Extension (2025)	Full LPA (2025)
Total Transit Employment (FTE)	6,942	7,424	7,489
Net Change in Direct Employment Over No Build	NA	482	546
Fairfax and Loudoun Employment Multiplier[1]	1.2233	1.2233	1.2233
Total Net Change in Employment in Fairfax and Loudoun	NA	590	668
Virginia Employment Multiplier[2]	1.3726	1.3726	1.3726
Total Net Change in Employment in Virginia	NA	661	750

Source: WMATA Operating & Maintenance Cost Model

5.1.2.1 Long-Term Effects

The employment and earnings impacts generated by O&M expenditures are long-term recurring benefits. They are summarized below.

A. No Build Alternative

The No Build conditions consist of the future economic conditions (employment, output and earnings) that would exist under the No Build Alternative. The economic analysis focused on the incremental differences between the No Build condition and implementation of the Wiehle Avenue Extension and the full LPA.

B. Wiehle Avenue Extension

For Fairfax and Loudoun counties, the effect of O&M spending for the Wiehle Avenue Extension would result in just over over $58.9 million in earnings, and 590 person-year jobs in Fairfax and Loudoun counties. Within the Commonwealth of Virginia, O&M spending would result in $71.7 million in earnings, and approximately 660 new person-year jobs.

C. Full LPA

For Fairfax and Loudoun counties, the effect of O&M spending for the full LPA would result in nearly $85 million in earnings and approximately 670 new person-year jobs. Within the broader Commonwealth of Virginia, O&M spending would result in nearly $103.5 million in earnings, and nearly 750 person-year jobs.

5.1.3 TAX REVENUE EFFECTS

Construction of both the Wiehle Avenue Extension and the full LPA would require the purchase of some private land and/or structures for easements, ROW, parking, and station facilities. This purchase would remove these properties from the existing local tax base. The annual tax revenue associated with the loss of properties due to ROW purchase, displacement and relocation was determined by first identifying the actual properties required for the Wiehle Avenue Extension and for the full LPA. The estimated assessed value (2001 base adjusted to 2003 tax year value) of the required acquisition was then multiplied by the current 2004 real estate tax rates for Fairfax and Loudoun counties. Real estate in Virginia is assessed at 100 percent of its fair market value.

Table 5.1-7 summarizes the assessed value of the properties to be acquired and shows the expected annual tax revenue lost from removing properties from the Fairfax and Loudoun county tax base for the No Build Alternative, Wiehle Avenue Extension, and full LPA. The expected annual special district tax revenue loss associated with removing properties from the tax base is summarized in Table 5.1-8.

In comparing the assessed property values shown in Table 5.1-7 with the ROW acquisition costs reported in Table 5.1-1, several caveats are in order as these two figures differ. The assessed value of property required for ROW acquisition is based on identifying those land parcels required for the alignment, determining the share of the parcel that will need to be purchased, and applying this share to the parcel's current assessment value according to the Tax Assessors' records in Fairfax and Loudoun counties. This value represents an estimate of the assessed value of the land to be purchased.

The ROW acquisition costs, by contrast, assume that the property sells for a price above the assessed value as speculation and market forces increase the parcels' sales price. There is a small and fixed amount of land along the Dulles corridor alignment that would need to be purchased making this a scarce resource. It is reasonable and prudent in estimating project cost to assume prices would rise accordingly. There is significant uncertainty about how much land values would appreciate in anticipation of the ROW acquisition; thus, the ROW capital cost used in this analysis assumes a 100 percent markup of the Assessed Value. For example, the $82,613,000 ROW costs estimated for the Wiehle Avenue Extension that are reported in Table 5.1-1 imply an assessed value of $41,306,500.

There are several property taxes that apply in the area where the ROW would be acquired. Both Fairfax and Loudoun counties levy a property tax on all properties. This is referenced as the Base Rate in the discussion below. In Fairfax County, the Base Rate is $1.13 per $100 of assessed property value. In Loudoun County, the Base Rate is $1.1075 per $100 of assessed property value (rates as of August 2004). In addition, several properties slated for ROW acquisition fall within two special taxing districts in Fairfax County. These are the Dulles Rail Transportation Improvement District, which levies an additional $0.22 per $100 assessed value above the county's Base Rate on commercial and industrial zoned property, and a tax imposed for the Control of Gypsy Moth/Canker Worm Infestations. This special tax levies $0.001 per $100 of the valuation of real estate within Fairfax County, including property in the incorporated towns within the county, but exclusive of the Lake Barcroft Water Improvement District. The calculation of the lost property tax revenue associated with transferring land from the private sector to public use is provided in Tables 5.1-7 and 5.1-8 below. Table 5.1-7 describes the Base Rate tax calculation. Table 5.1-8 describes the calculation of the special taxes.

Table 5.1-7: Assessed Value of Properties Required for ROW and Associated Loss of Base Tax Revenues (in thousands, 2004 dollars)

Alternative	No Build Alternative (2025)	Locally Preferred Alternative	
		Wiehle Avenue Extension (2025)	Full LPA (2025)
Assessed Value of Fairfax County Properties	$0	$41,306	$45,696
Base Tax Rate[1]	$1.13	$1.13	$1.13
Lost Revenue Fairfax County	$0	$467	$516
Assessed Value of Loudoun County Properties	$0	$0	$7,334
Base Tax Rate[1]	$1.1075	$1.1075	$1.1075
Lost Revenue Loudoun County	$0	NA	$81
Total Base Tax Revenue Lost	$0	$467	$598

Per $100 of assessed value.

Note: Allocation of assessed value between Fairfax and Loudoun counties is based on an estimate of partial acquisitions proportioned between counties

Source: DRPT and Counties of Fairfax and Loudoun

Table 5.1-8: Assessed Value of Properties Required for ROW and Associated Loss of Special District Tax Revenues (in thousands, 2004 dollars)

Alternative	No Build Alternative (2025)	Locally Preferred Alternative	
		Wiehle Avenue Extension (2025)	Full LPA (2025)
Assessed Value of Fairfax County Properties	$0	$41,306	$45,696
Assessed Value of TID Properties in Fairfax County	NA	$30,400	$30,400
Dulles TID Tax Rate	$0.22	$0.22	$0.22
Lost Revenue in TID	NA	$67	$67
Gypsy Moth Tax Rate	0.001	0.001	0.001
Lost Revenue from Special Gypsy Moth Tax	NA	0.413	0.457
Total Special Tax Revenue Lost	NA	$67.29	$67.34

Source: DRPT and Fairfax County

Combining the lost revenues from the Base and Special Purpose taxes shown in the tables above, the lost property tax revenue associated with the full LPA is $665,000. Lost property tax revenue associated with the Wiehle Avenue Extension is $534,000. In both cases, loss of the tax base is a fraction of the total tax base in the two counties. According the *Annual Report (Fiscal Year 2003)* of the Virginia Department of Taxation, the total taxable fair market value in Fairfax County was $114.9 billion and in Loudoun County it was approximately $24.9 billion. The report provides the most recent data available; it reports values for tax year 2002. Thus, the $45.6 million in assessed value lost in Fairfax County represents 0.04 percent of the 2002 tax year tax base for the full LPA, since it has the highest purchase requirements. In the case of Loudoun County, the estimated loss for the full LPA represents 0.03 percent of the 2002 tax base. As the total value of the tax base in both counties rose between tax year 2002 and 2003, the shares calculated above have likely fallen slightly.

The lost tax revenues associated with this fractional reduction in the tax base would be a recurring loss on an annual basis. Partially offsetting these losses, however, is an increase in other tax revenues. For example, the creation of new jobs and earnings associated with the recurring O&M spending would foster greater retail spending. The Commonwealth of Virginia taxes retail sales at a 3.5 percent rate. Fairfax County taxes retail sales at a 1 percent rate. Loudoun County does not have a retail sales tax. The additional revenues from this spending are recurring gains.

The construction of the LPA is also expected to have positive effects on the value of residential and commercial properties within walking distance to the station areas. The increase in value translates into greater tax revenues and would be expected to accrue to the counties. These effects could be amplified by increased density allowances in the station areas. The development effects that are anticipated from the Wiehle Avenue Extension and the full LPA are described in greater detail in Section 5.2 Station Area Development.

5.2 STATION AREA DEVELOPMENT

For analysis of development impacts of the proposed improvements, assessment zones were defined around each proposed station. The sizes of these zones vary by location and are based on the areas in which direct development impacts are possible. Direct impacts were based on the comprehensive plans for each jurisdiction, and are defined as the area in which density bonuses are available upon implementation of the LPA.

For proposed stations within the Tysons Corner area, the impact assessment zone is defined, generally, as the traffic analysis subzones that fall within 1,600 feet of the stations. For the proposed stations in Fairfax County west of Tysons Corner, the impact assessment zones are defined by land units, as developed by the Dulles Corridor Land Use Task Force, that fall within one-half mile of the proposed station. Finally, for the proposed stations in Loudoun County, the assessment zones are defined as all land within one-half mile of the proposed stations. Analysis of the Dulles Airport Station was limited to the main terminal area.

5.2.1 STATION AREA PLANNING AND DESIGN GUIDELINES

The Fairfax County Comprehensive Plan, *2003 Edition* (Comprehensive Plan) and the *Loudoun County Revised General Plan, Amended January 2003* (General Plan) include design guidelines for areas surrounding the proposed stations. The Build Alternatives is also expected to have positive effects on commercial and residential properties located near transit stations. The Build Alternatives would contribute to greater economic development by encouraging or supporting higher-density residential and commercial land uses around transit stations. Past experience with the Metrorail system has demonstrated that transit investment has had positive effects on the residential and commercial development near the stations. It is expected that new development around station areas in the Dulles Corridor would also attract businesses from outside Fairfax and Loudoun counties, providing net economic benefits. Both plans define policy guidelines designed to coordinate and facilitate increases in development. The following sections discuss the guidelines as they would apply to the station areas. Please see Figure 5.2-1 for station locations.

Tysons Corner has been designated as an urban center in the Comprehensive Plan. Although the land area is split between the McLean and Vienna Planning Districts, the Comprehensive Plan dedicates a separate section to the Tysons Corner Urban Center and describes detailed plans for development. These plans include use, density floor and area ratio (FAR), height, and urban design guidelines.

Station Locations

Dulles Corridor Rapid Transit Project

The Comprehensive Plan divides the Tysons Corner Urban Center into three generalized areas: core, non-core, and edges. The core, generally bounded by Westpark Drive on the north, the Capital Beltway on the east, and Route 7 on the south and west, is divided into three activity centers. These activity centers are designated Tysons I, Tysons II, and Greensboro Drive and encompass about 20 percent of the land area in Tysons Corner. Surrounding the core, the non-core areas are divided into six sub-areas: West*Park; West Gate; East Route 7; West Route 7; a high-density residential area; and Tyco Road. Beyond the non-core areas, the plan designates an "edge" that defines the limits of Tysons Corner and serves as a buffer to adjacent single-family neighborhoods. The outer limits of this edge are roughly the Dulles International Airport Access Highway (DIAAH) and Dulles Toll Road to the north, Magarity Road to the east, Old Courthouse Road to the south, and the Courthouse Spring Branch Environmental Quality Corridor to the west.

In the core areas, a greater emphasis is placed on the development of mixed-use centers. However, given the development in place, the Greensboro Drive activity center is envisioned to remain a predominantly office employment center, and the Tysons I activity center would be primarily characterized as a retail center. The Tysons II area has the greatest potential for a balanced mix of uses due to the large amount of undeveloped land.

The non-core areas, despite some infill redevelopment and design improvements, are planned to have a predominantly suburban character. Today, these areas include a range of uses generally clustered by office parks, strip retail, and auto dealerships. These areas are envisioned to maintain their general uses with some conversion of strip retail into office development with integrated retail. Beyond these areas, the edges are designed to buffer the single-family neighborhoods surrounding Tysons Corner, which are expected to remain primarily residential in nature and not absorb much additional development.

One of the primary objectives of the Plan for Tysons Corner will be to provide alternative modes of transportation, including an emphasis on pedestrian- and transit-oriented design. The Plan calls for mixed-use developments, connected to transit and accessible by foot. The plan further calls for these physical connections to be attractive and appealing to pedestrians with the inclusion of trees, signage, and street furniture.

The primary planning objective for the Dulles Corridor Rapid Transit Project stations at Wiehle Avenue, Reston Parkway, Herndon Monroe Station, and Route 28 is to create mixed-use developments with a more urban character in areas closest to the stations. The recently adopted amendments to the Comprehensive Plan include a set of design guidelines with two primary goals: first, to create a pedestrian-friendly environment that would complement the plan recommendations; and second, to protect the existing high-quality built and natural environment.

The urban design guidelines established in the Comprehensive Plan cover a range of features including building heights, gateways, pedestrian and transit-oriented design, and streetscaping. The design guidelines cover a range of issues from building design, height, and arrangement to transit access and pedestrian and bicycle connections. These guidelines place the densest development immediately adjacent to the transit stations with densities tapering off toward the existing neighborhoods. They also require physical connections for pedestrians and bicycles to the stations and within the station areas. Other requirements include underground parking or parking structures when possible, the prohibition of freestanding retail establishments, provision of plazas or courtyards, and coordinated lighting and signage.

The design of the Dulles Airport station would be coordinated with MWAA and would be accommodated in plans for the airport. The design of areas outside of the station, including pedestrian access, parking, and circulation, is managed by MWAA.

The General Plan includes guidelines for development around the Route 606 and Route 772 stations. The General Plan identifies the Route 606 station area as a Transit Related Employment Center (TREC) and the Route 772 Station area as Transit Oriented Development (TOD). Although the TOD would include a significant amount of residential development and the TREC would not, the general design guidelines apply to both areas.

The General Plan calls for the areas around the two stations to be developed in a transit- and pedestrian-friendly manner with short blocks and a rectilinear grid street pattern. Guidelines include pedestrian-oriented building facades with ground-floor retail and distinctive public spaces.

At Route 772, the General Plan calls for a commercial core defined by a one-quarter mile radius around the station and an outer core between the one-quarter and one-half mile radii. If the station is to be located within the median of the Dulles Greenway, the plan encourages the creation of an urban deck over the roadway.

5.2.2 STATION AREA CHARACTERISTICS AND DEVELOPMENT POTENTIAL

The Comprehensive Plan and the General Plan provide for existing development characteristics and density bonuses at the proposed new Metrorail station locations. The following section describes the potential changes in the level of development at each of the station areas due to the implementation of the Build Alternatives. The potential changes in development for the Wiehle Avenue Extension and the full LPA that could occur if Metrorail is implemented in the corridor are compared to projections for the No Build Alternative for 2025.

Tysons East Station Area

The Tysons East Station would be located on Route 123 east of the Capital Beltway near the intersection of Colshire Drive. Large office buildings with large parking facilities define the character of this area while some low-rise apartment and townhouse communities with on-street parking are also located in the station area. Most of the land is developed. Because of the presence of low-density and somewhat older structures, there is great potential for this station area to change in character from a suburban pattern to more of a transit-supportive land use mix, if redeveloped. Several of the parcels would be eligible for density bonuses if Metrorail were constructed, resulting in a mixed-use area with direct access to regional transit.

The Comprehensive Plan provides for increased densities in the areas surrounding the proposed Tysons East Station. To the north of Route 123, the plan recommends densities of 0.5 to 1.0 FAR without rail service. With rail service, the plan allows non-residential development up to 1.5 FAR within 1,000 feet of the station, and up to 1.0 FAR between 1,000 and 1,600 feet of the station. If the Comprehensive Plan was amended to include residential uses, these rail-related densities could increase significantly. South of Route 123, the plan allows all of the areas along Old Meadow Road and Colshire Drive to increase to a maximum of 1.0 FAR; however, the density increases allowed north of Route 123 also apply in this area.

Tysons Central 123 Station Area

The Tysons Central 123 Station would be located north of Tysons Corner Center on Route 123 outside the Capital Beltway. The primary features of this area are the undeveloped parcels located north of the proposed station location. Development proposals have been approved for 6.8 million square feet of office and possible mixed-use development oriented toward a future station. Approximately 2.4 million square feet has already been constructed. As approved in June 2003, the remaining development may move forward when the project receives a Full Funding Grant Agreement (FFGA) from FTA. Farther to the north within this area is the Tysons Galleria, while a landscaped area and parking for Tysons Corner Center is located south of the station. The area is auto-oriented with buildings set back from major arterial roadways and the Capital Beltway. Most of the development is separate from surrounding uses and there is little pedestrian activity due to the large surface parking lots and scale of the roadways in the area. However, the large tracts of surface parking within the station area could be redeveloped at greater densities.

The currently undeveloped land north of the proposed station is projected to be developed as part of the No Build Alternative. The presence of a station in this location would provide pedestrian linkages to Tysons Corner Center and Tysons Galleria and would allow more intense development under the density bonuses allowed in the Comprehensive Plan. The ability of this transit station area to change in character is limited somewhat by the large amount of acreage dedicated to major roadways and the existing shopping malls.

The Comprehensive Plan provides for increased densities in the areas surrounding the proposed Tysons Central 123 Station. To the north of Route 123, the plan allows the currently planned 1.0 FAR maximum to increase to 2.0 FAR within 1,000 feet of the station and to 1.65 FAR between 1,000 and 1,600 feet of the station. South of Route 123, the plan allows the existing 0.8 FAR to increase to 2.0 FAR within 1,000 feet of the station and to 1.65 FAR between 1,000 and 1,600 feet of the station. If plans were amended to include the provision of housing, these rail-related densities could increase significantly. Potential levels of development for the Wiehle Avenue Extension would be the same as those of the full LPA.

Tysons Central 7 Station Area

The Tysons Central 7 Station area would be located along Route 7 just west of the Route 7/Route 123 interchange. The development in this station area includes strip retail with parking lots immediately adjacent to the proposed station platform and major office development located along Greensboro Drive and Westpark Drive. The scale of the office development is larger than in other areas of Tysons Corner and pedestrian activity is limited. Some townhouses are located within the station area on Gosnell Road, but would be separated from the station platform by the Pike 7 Plaza.

The Tysons Central 7 Station area has significant potential for increased densities, as allowed by the Comprehensive Plan, in the vicinity of rail stations. Much of the land within this area is used as parking for strip-mall developments. While the area is completely developed, there is potential for redevelopment which could introduce a more transit-oriented development pattern.

The Comprehensive Plan provides for increased densities in the areas surrounding the Tysons Central 7 Station. For core areas (in this case the area east of Route 7) the plan allows densities up to 2.0 FAR within 1,000 feet of the station and 1.65 FAR between 1,000 and 1,600 feet of the station. For non-core areas the allowable densities are lower: 1.5 FAR within 1,000 feet and 1.0 between 1,000 and 1,600 feet. If the Comprehensive Plan was to be amended to include housing, these rail-related densities could increase significantly.

Tysons West Station Area

The Tysons West Station area would be located on Route 7 at the intersections with Tyco Road and Spring Hill Road. A variety of uses exist in the station area, including strip-development retail, industrial, commercial, as well as some residential development that would be separate from the station location. Two features dominate the development character of this area: 1) Route 7, a heavily traveled major arterial with few pedestrian crossings; and 2) several large auto dealerships. The combination of these two features results in a large amount of space in the station area that is currently used for surface parking lots and roadways. In addition, the industrial component located along Tyco Road limits pedestrian activity. The Comprehensive Plan supports redevelopment for this area.

Under the Build Alternatives, the potential exists for a change in character in the Tysons West station area. The area is auto-oriented and could become more transit-oriented in the future as more density is allowed should the transit station be constructed. However, there would be some constraints to this redevelopment due to the lack of pedestrian connections across Route 7 and the presence of successful auto dealerships. Nonetheless, the construction of the station would encourage a more transit-supportive character in the area.

Currently, the Comprehensive Plan does not provide for increased densities in all areas surrounding the proposed Tysons West Station. South of Westwood Center Drive/Tyco Road, on both sides of Route 123 the plan allows the planned densities to increase to 1.5 FAR within 1,000 feet of the station and to 1.0 FAR between 1,000 and 1,600 feet of the station. If the Comprehensive Plan was amended to include housing, these rail-related densities could increase by 50 percent. North of this area, the plan does not include density bonuses associated with the station and limits development to a maximum of 1.0 FAR.

Wiehle Avenue Station Area

The Wiehle Avenue Station would be located within the median of the DIAAH just west of the Wiehle Avenue overpass. Current development within the station area is suburban in character, consisting of individual office buildings and office parks immediately adjacent to the station location. Many of the office buildings were recently constructed and include large surface parking lots and some parking garages. On the north side of the station area, there are limited industrial uses and two large surface park-and-ride lots. The Washington & Old Dominion (W&OD) Railroad Regional Park bisects the north side of the transit station area.

The Wiehle Avenue Station would provide pedestrian connections across the DIAAH and Dulles Toll Road to businesses in Reston. In addition, the Comprehensive Plan allows for mixed-use, transit-oriented development up to a 2.5 FAR to occur on the north side of the transit station area and up to 1.25 FAR on the south side of the station area upon approval of the FFGA for implementation of the Build Alternatives. This new development, in conjunction with the transit station, could create a more transit-supportive environment at the Wiehle Avenue Station. For redevelopment to occur, parcel consolidation, particularly on the north side, would need to occur. Fairfax County is working to solicit joint development commitments for this site that would include mixed-uses, parking, and station facilities.

With the implementation of the Build Alternatives at the Wiehle Avenue Station, plan options in the modified Comprehensive Plan (amended January 27, 2003) allow for density bonuses dependent on achieving a certain mix of uses. At the Wiehle Avenue Station, the Comprehensive Plan allows for mixed-use development within one-half mile of the station. The plan calls for 40 to 75 percent of development to be residential with remaining development split between office, retail and hotel uses, and office uses limited to 40 percent. The land units between one-quarter and one-half mile of the station are

allowed the following bonus densities: a mix of 35 to 50 percent residential, up to 50 percent office, and up to 15 percent retail, with the option for hotel uses. The levels of development for the Wiehle Avenue Extension would be the same as that of the full LPA.

Reston Parkway Station Area

The development character of the Reston Parkway Station area is similar to that of the Wiehle Avenue Station area. Some of the land within the station area consists of the DIAAH and Dulles Toll Road and cannot be developed. Most of the development in the station area consists of large office buildings surrounded by landscaped grounds with both surface and structure parking. The Reston Town Center, located north of the DIAAH, is more urban in character and includes a mix of retail, residential, and office uses in a single development. Several large parking structures surround and provide parking for the Town Center. In addition, a large-scale residential development located on Reston Parkway has been completed, and another has begun. On the south, there is some low-rise retail development along Sunrise Valley Drive, a major high-rise office development, and a hotel. There are still some undeveloped parcels, including those just to the west of the Reston Town Center, within the station area.

The Comprehensive Plan allows for mixed-use transit-oriented development, with up to a 2.0 FAR, within one-quarter mile of the transit station area upon approval of the FFGA for implementation of the full LPA. For areas south of the DIAAH (e.g., Carr America site), the plan calls for 40 to 50 percent of development to be residential with remaining development split between office, retail, and hotel uses, and office uses limited to 40 percent. For areas north of the DIAAH and Dulles Toll Road (e.g., TRW site), the plan calls for 50 to 60 percent of development to be residential. The land units between one-quarter and one-half mile of the station are allowed the following bonus densities: a mix of 35 to 50 percent residential, up to 50 percent office, and up to 15 percent retail, with the option for hotel uses. This new development, in conjunction with the transit station, could create a more transit-supportive environment at the Reston Parkway Station. In addition, the Reston Parkway station would provide direct access across the DIAAH and Dulles Toll Road to the TRW building between the Nextel development and proposed uses on Town Center Parkway. A new station would also provide pedestrian connections directly to several large developments on Sunset Hills Drive, the residential area of West Market, and the Reston Town Center. The future level of development for this station under the Wiehle Avenue Extension would be the same as the No Build Alternative.

Herndon-Monroe Station Area

The Herndon-Monroe Station area would include portions of the Town of Herndon and Fairfax County. Some of the land within the station area consists of the DIAAH and Dulles Toll Road and cannot be developed. Other development in the station area can be classified as suburban, with residential uses separated from the office development. Because most of the land in this station area is developed, any new development would have to be in the form of redevelopment. One exception is an undeveloped parcel located south of Herndon Parkway in the eastern portion of the station area.

The Herndon-Monroe station area does not have much new growth potential with implementation of the full LPA. The Town of Herndon is re-evaluating their plans for the area in the hopes of encouraging more transit-supportive development and joint development in the future. Although density bonuses are permitted in the area south of the station, a change in development character is limited due to presence of the existing park-and-ride facility, single-family homes, and wetlands. The Herndon-Monroe Station would provide an additional pedestrian connection between the Town of Herndon and Fairfax County, and would provide access to pedestrian facilities, businesses, and homes located in the station area.

With the implementation of the full LPA, the Comprehensive Plan would allow for mixed-use development immediately east of the park-and-ride facility and to the west of Monroe Street. The plan calls for 55 to 65 percent of development to be residential with remaining development split between office, retail, and hotel uses. The land units between one-quarter and one-half mile of the station are allowed the following bonus densities: a mix of 35 to 50 percent residential, up to 50 percent office, and up to 15 percent retail, with the option for hotel uses. Those parcels that include the Herndon-Monroe park-and-ride facility and the Sunrise Valley Park Wildlife Habitat and Nature Preserve would not change with the implementation of the full LPA. Land uses north of the proposed station within the Town of Herndon are not anticipated to change with implementation of the LPA based on current plans. The future level of development at this station for the Wiehle Avenue Extension would be the same as the No Build Alternative.

Route 28 Station Area

The Route 28 Station would be located to the east of the Dulles Toll Road and Route 28 interchange within Fairfax County. Most of the station area is undeveloped. Development that does exist is located primarily to the north of the Dulles Toll Road and includes townhouses, a school, the Center for Innovative Technology (CIT), and some open space. Development plans for the north side include additional residential units. The south side is largely undeveloped, although mixed-use development projects have been approved. Some major suburban office developments and a hotel are located within the area.

The change in character at Route 28 could include new transit-oriented development (particularly south of the Dulles Toll Road), transit facilities such as Kiss & Ride lots, and pedestrian connections throughout the area. Many of these improvements are proposed as elements of the Dulles Station development project, which would be located south of the Route 28 Station.

With the implementation of the full LPA, the Comprehensive Plan allows for most of the land units north of the station within one-half mile to be developed in a mixed-use fashion with a significant amount of residential use. The plan calls for 35 to 50 percent of the development to be residential, up to 50 percent office, and up to 15 percent retail, with the option for hotel uses. South of the proposed station, the plan recommends a mix of uses including office and high-density residential, but does not quantify that mix. The future level of development at this station for the Wiehle Avenue Extension would be the same as the No Build Alternative.

Dulles Airport Station Area

The only developments near the station at Dulles Airport are airport-related facilities. The development character would not change at the Dulles Airport Station.

Route 606 Station Area

The area around the Route 606 Station in Loudoun County is undeveloped or is part of the Dulles North Transit Center. South of the Dulles Greenway, most of the land is within the confines of the Dulles Airport, limiting the development potential.

The recently adopted General Plan established a TREC at the Route 606 station area. This designation provides for the creation of a mixed-use transit node with office, light industrial and supporting uses. With the implementation of the full LPA, the maximum allowable density increases from 0.6 FAR to 2.0 FAR. The development potential of this area is limited by height restrictions due to its proximity to the airport. Airport noise restrictions prohibit the construction of residential development in this area. Under the

Wiehle Avenue Extension, the future level of development at this station area would be the same as under the No Build Alternative.

Route 772 Station Area

The area around the Route 772 Station is also largely undeveloped. Within a half-mile of the stop are some single-family homes and townhouses. Two major planned developments have been approved for the station area: Moorefield Station and Loudoun Station. South of the station, the Moorefield Station development will include more than 9 million square feet of commercial development and 6,000 dwelling units on 600 acres. Moorefield Station will be developed in phases and will be closely coordinated with the extension of Metrorail service to the site. North of the station, the Loudoun Station development will include up to 1,514 multi-family dwellings, as well as up to 1.8 million square feet of office, hotel, theater, and retail uses.

The presence of a transit stop would allow for transit-oriented development under the General Plan, including a mix of uses, pedestrian connections, dense development at the station, and limitations on auto-oriented development. With the implementation of the full LPA, the plan allows for an increase from 0.6 FAR and 16 dwelling units per acre to 2.0 FAR and 50 dwelling units per acre, with the highest densities closest to the station. The future level of development at this station under the Wiehle Avenue Extension would be the same as that of the No Build Alternative.

5.2.3 MITIGATION

No mitigation measures are proposed. Station area developments would enhance the transit-supportive character of the area surrounding the proposed stations. The land use plans developed by local governments within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable bike-friendly development patterns in close proximity to transit stations.

5.3 DEVELOPMENT EFFECTS

This section assesses the level of development projected in the corridor as a result of the Wiehle Avenue Extension and the full LPA in comparison with the No Build Alternative. The data presented is based on a real estate assessment of the parcels within the corridor that would be located within walking distance of the station areas (defined as one-half mile). Obstacles that would hinder development, such as the presence of recently constructed buildings, residential properties, or small parcel sizes were considered as part of the analysis. These projections are based on the continuation of the positive market conditions within the corridor and predict that much of the development potential allowed in local comprehensive plans would be achieved. For many of the parcels evaluated, it is also projected that full density bonuses due to proximity to transit stations and the inclusion of housing would be allowed. For this analysis, scenario requirements assume a level of development that is projected close to build-out in some sections of the corridor. The local jurisdictions will ultimately determine the level of growth actually allowed in the future.

5.3.1 CORRIDOR DEVELOPMENT PROJECTIONS

The Dulles Corridor is one of the region's fastest growing areas and is expected to continue growing over the next 25 years. The intensity of development in the station areas could increase with the implementation of the Build Alternatives. The Build Alternatives are not, however, expected to have a significant impact on development outside the station areas where market forces would continue to be

primary factors that control the timing and quantity of development. The influence of the project on development outside of station areas is discussed in Chapter 9.

The development projections were determined based on a real estate evaluation of the study area and were developed in conjunction with Fairfax and Loudoun counties. The method for developing the projections included a parcel-by-parcel evaluation of development in the corridor. A variety of criteria were used to determine the level of development. These criteria included the size of the parcel under consideration, ownership, visibility, access to the site for vehicular and transit patronage, environmental constraints, location, and overall development characteristics of the area. Parcels containing recently constructed buildings or containing residential development were not considered as primary locations for development.

With the exception of Tysons West, parcels located within the transit station areas, as defined in the comprehensive plans for the localities, are eligible for density bonuses. Information on existing development within the transit station areas was gathered from the localities, and field verified. This data was used to verify the regional projections from the Metropolitan Washington Council of Governments (MWCOG) Round 6.3 forecasts, which include projections for growth within the corridor for four categories—retail (including hotel and institutional development), industrial, office, and residential development. No Build Alternative projections were developed using the MWCOG data and adjusted for growth that has already occurred.

The potential level of growth within the corridor was determined for the Build Alternatives by calculating the potential development associated with the proposed transit station areas. These development totals were estimated by reviewing a variety of factors that could affect development within the station areas, including the availability of vacant land for development, the need for parcel consolidation, development constraints, and the market attractiveness of the station area. The totals are possible outcomes that may or may not occur.

Table 5.3-1 shows the potential increase in corridor development by 2025 for the Wiehle Avenue Extension and the full LPA in comparison to the No Build Alternative that could occur based on the guidelines provided in the local planning documents and projected market conditions. Development is expected to increase substantially within the corridor under the No Build Alternative, but could further increase with implementation of the Build Alternatives. The Wiehle Avenue Extension would generate less development than the full LPA because it would include fewer stations.

Table 5.3-1: Potential Increase in Corridor Development by 2025 Compared to the No Build Alternative

Development Type	No Build Alternative (2025) (square feet)	Locally Preferred Alternative (percent increase)	
		Wiehle Avenue Extension (2025)[1]	Full LPA (2025)[1]
Office	75,293,100	8%	17%
Retail	27,861,300	4%	18%
Industrial	26,746,300	-1%	1%
Residential	155,397,500	5%	10%
Total	285,118,200	5%	12%

[1] Projections are based on information for 2025 only. Opening year 2011 and 2015 forecasts were not prepared due to the longer period of time required for development to take effect following the opening of the Wiehle Avenue Extension and the full LPA.
Data for the Hotel and Institutional uses are included in the Retail category. LPA estimates are based on No Build estimate plus increased development projected at station areas.
Source: MWCOG Round 6.3 Forecasts (No Build only).

The most significant increases in potential development are expected in the residential and commercial (office and retail) categories. These development projections reflect the density bonuses available in the *Fairfax County Comprehensive Plan* and the *Loudoun County Revised General Plan* based on the implementation of the Build Alternatives.

5.3.2 JOINT DEVELOPMENT OPPORTUNITIES

Joint development opportunities provide benefits to the transit patrons, transit agencies, and/or the local jurisdictions. The transit patron is benefited by additional conveniences tied to the station platform or adjacent land and improved access to surrounding land uses. The transit agency or unit of government would control joint uses on land adjacent to the station. Joint uses potentially benefit the transit agency through increased funds and ridership resulting from the increased convenience for patrons.

Within the Dulles Corridor, both Fairfax and Loudoun counties have detailed policies that direct transit-oriented development into the station areas for the corridor. In addition, WMATA has a long-standing, proven joint development program whereby higher density development is accomplished near station areas.

WMATA has been a national leader in joint development, being one of the first transit systems in the country to establish a Joint Development Program. The historical benefits of WMATA's joint development program have included increased ridership; creation of 25,000 primary jobs; generation of over $20 million in annual property tax revenue to local jurisdictions; development of 5.6 million square feet of office space, 2.5 million square feet of retail space, almost 1,300 hotel rooms and 6,000 residential units; and a long-term revenue flow to WMATA through long-term land leases with developers.

WMATA is a partner in more than 50 public/private ventures utilizing air space over and land adjacent to Metrorail stations. The joint development sites contribute approximately $11 million annually to Metrorail funding. WMATA's joint development projects are supported by the local jurisdictions through zoning and comprehensive planning procedures.

For the Dulles Corridor, many of the station areas already have facilities that have been proffered by private developers that would support the transit facility. These include such items as Kiss & Ride or bus drop-off facilities.

The Tysons West, Wiehle Avenue, Herndon-Monroe, and Route 772 station areas have the greatest potential for joint development. Joint development is being considered for the park-and-ride lot that would be part of the Wiehle Avenue Station that would incorporate mixed-use development, parking, and direct pedestrian access to the station. This joint development would be on county-owned land.

Additional transit facilities, including a bus drop-off and Kiss & Ride lot, could be provided on the north side of the Herndon-Monroe Station through a joint development program. This joint development would occur on what is now privately owned land that would need to be converted to town land in the future.

The Route 772 Station area has been configured to accommodate planned transit-oriented developments, Loudoun Station on the north side and Moorefield Station on the south side.

With respect to air rights development, there has been discussion, but no formal initiative or agreement to date to set policy, for the Wiehle Avenue Extension or full LPA. As developable land becomes more scarce, the value of air rights might increase, especially within areas of high density. Higher densities at

some of the station areas that may be triggered by the Build Alternatives might open up opportunities for joint development (as discussed in Section 5.3.3) including air rights development above transit stations and their facilities. As designed, the proposed stations, guideways, and other facilities do not preclude future air rights development by others. Moreover, all local land use decisions are under the control of the local government, and at this time no specific provisions are planned to address such development.

6 TRANSPORTATION EFFECTS

This chapter describes the long-term and construction effects of the No Build Alternative, the Wiehle Avenue Extension, and the full LPA on the local and regional transportation network. The analysis includes the following sections:

Section 6.1 discusses the existing and planned transit system in the Dulles Corridor and the potential effects of implementing the No Build Alternative, the Wiehle Avenue Extension, and the full LPA.

Section 6.2 presents the existing and planned roadway system in the Dulles Corridor, as well as the potential effects of the No Build Alternative, the Wiehle Avenue Extension, and the full LPA on the planned system. Measures proposed to mitigate traffic impacts are also described.

Section 6.3 presents the anticipated long-term effects associated with the No Build Alternative, the Wiehle Avenue Extension, and the full LPA on other transportation facilities in the corridor. The section also presents the proposed mitigation measures for any anticipated adverse effects.

The alternative formerly known as "LPA Phase 1" in the October 2003 Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation has been renamed the Wiehle Avenue Extension in this Final EIS and is expected to begin operations in 2011. This change reflects the federal approach to the project's funding under the Federal Transit Administration's New Starts program. It will assure consistency among the environmental, engineering and financial documents during the project's development.

In the October 2003 Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation as well as this Final EIS, the term "full LPA" represents the Wiehle Avenue Extension and the second phase of the Dulles Corridor Rapid Transit Project. This second phase would extend west from Wiehle Avenue to Washington Dulles International Airport and Route 772 and is expected to begin operations in 2015.

The term "LPA", "proposed action", or "selected LPA" refers to both the Wiehle Avenue Extension and the full LPA collectively.

6.1 TRANSIT EFFECTS

The Dulles Corridor Rapid Transit Project would add rapid transit service, in the form of Metrorail and express bus service, to the Dulles Corridor. The corridor is currently served by express and local bus services, but implementation of the Wiehle Avenue Extension and full LPA would result in a substantial increase in high-quality transit capacity.

This section discusses the existing and planned transit system in the Dulles Corridor, as well as the potential effects of implementing the Wiehle Avenue Extension and the full LPA on the planned transit system. In Section 6.1.1, the methodology for evaluating transit effects is discussed. Section 6.1.2

summarizes the existing transit system in the Dulles Corridor and the planned transit system without the Dulles Corridor Rapid Transit Project which represents the No Build Alternative. Section 6.1.3 presents the anticipated long-term effects associated with the No Build Alternative, the Wiehle Avenue Extension and the full LPA, in terms of transit ridership, transit travel times, transit capacity, operations and maintenance costs, and other measures of transit service. Section 6.1.4 provides an overview of the expected effects on transit service during construction of the Wiehle Avenue Extension and the full LPA, and Section 6.1.5 presents proposed mitigation measures for any anticipated adverse effects.

6.1.1 METHODOLOGY

The anticipated effects of the No Build Alternative, the Wiehle Avenue Extension and full LPA on transit ridership and other transit operating characteristics were evaluated using the Northern Virginia Major Investment Study Model (NVMISM). This model was developed for the original Dulles Corridor MIS and was last used, prior to this project, for the I-66 MIS. The model used regionally adopted population and land use data (Metropolitan Washington Council of Governments [MWCOG] Round 6.3 Cooperative Land Use Forecasts), future highway and transit networks, transit operating plans developed for the project, assumptions regarding tolls on the Dulles Toll Road, and other specific model inputs described in the following paragraphs.

Travel demand forecast results are based on the MWCOG Round 6.3 Cooperative Land Use Forecasts. These forecasts represent the regionally adopted population and employment forecasts, through 2025, for the metropolitan Washington area, including Fairfax and Loudoun counties. By federal regulation, such regionally approved land use forecasts must be used in the travel demand analysis of each alternative studied in an EIS. More specifically, model assumptions regarding socioeconomic variables and land use must be consistent among alternatives so as to not bias the results of the travel demand forecasting process.

The transportation analysis zones (TAZs) used for the travel demand forecasts were based on the TAZ structure used for MWCOG's regional travel demand forecasting model set. By federal regulation, this TAZ structure must be used to ensure an accurate comparison of transportation projects. Since the TAZs in Tysons Corner, Reston, and Loudoun County were quite large, the project team worked with Fairfax and Loudoun counties to split these zones to more accurately distribute population and employment data, as well as land use densities within the smaller zones. No adjustments were made to the original TAZ boundaries or total TAZ population and employment data.

Operating plans for the No Build Alternative, the Wiehle Avenue Extension and full LPA were developed based on a common set of assumptions relative to fares, service frequencies, vehicle load factors, vehicle dwell times, corridor parking capacities, and other service variables. Each alternative was then modeled for its opening year (2011 for the Wiehle Avenue Extension, 2015 for the full LPA) and forecast year (2025) based on a preliminary service plan. Following initial model runs, these preliminary service plans were adjusted to provide adequate capacity for ridership demand at maximum load points (through equilibration). The operating plans for the full LPA reflect line-haul services operating within the corridor formed by the Dulles Connector Road, the Dulles International Airport Access Highway (DIAAH), and the Dulles Toll Road, as well as complementary local and feeder bus service operating in activity centers along the corridor.

6.1.2 EXISTING AND PLANNED TRANSIT SYSTEM

As described in Chapters 1 and 2, the existing transit system in the Dulles Corridor consists primarily of express and local bus services provided by Fairfax County, Loudoun County, and the Washington Metropolitan Area Transit Authority (WMATA). Transit services for the three providers are integrated with transit centers and park-and-ride lots located throughout the corridor.

6.1.2.1 Primary Transit Services

Existing and planned services and facilities in the Dulles Corridor are described in Chapters 1 and 2, and the anticipated No Build transit network in 2025 is depicted in Figure 2.4-1. Table 6.1-1 provides a summary of the primary transit services currently operating in the corridor.

Table 6.1-1: Summary of Primary Transit Services

	WMATA		Fairfax County	Loudoun County
Name of Service	Metrorail	Metrobus	Fairfax Connector	Loudoun County Transit
Type of Service	Regional Rail	Regional service with some local circulation	Express, feeder, and local circulator bus	Express, reverse commute, and local circulator bus
Total Number of Routes	5 lines	322 routes	54 routes	3 commuter route families, 4 circulator routes
Number of Routes in Corridor	1 line	14 routes	28 routes	3 commuter route families, 2 circulator routes
Peak Service Frequencies in Corridor	6 minutes	15-30 minutes	5 – 30 minutes	~ 15 minutes

Information on transit travel times and other service characteristics for the transit network in the No Build Alternative is provided in Section 6.2.3. More detailed information on transit centers and other transit services in the Dulles Corridor is provided in the following sections.

6.1.2.2 Transit Centers

An important element of existing and near-term planned transit service in the Dulles Corridor is its network of bus transit centers and park-and-ride lots. Figure 6.1-1 presents the location of the park-and-ride facilities and bus transit centers within the corridor. Each of these facilities is identified and described in Table 6.1-2. Facilities that also provide parking are described in further detail in Section 6.3. The Tysons-West*Park Transit Station is the primary bus transfer facility for Tysons Corner, particularly for express bus service and other travel to and from the north, west, and east. In addition, an on-street facility on the ring road of the Tysons Corner Center shopping mall currently serves as a transfer point for internal trips and trips oriented south and east of Tysons Corner, as well as some local Fairfax Connector routes from the west.

Dulles Corridor
Rapid Transit Project

Table 6.1-2: Bus Transit Facilities in the Dulles Corridor

Bus Transit Centers	Location	Owner/ Operator	No. of Bays	Kiss & Ride	Parking	Connecting Services
East Falls Church Metrorail Station	I-66 at Sycamore Drive, Arlington	WMATA	8	Yes	Yes	Metrobus
West Falls Church Metrorail Station (south side)	I-66 at Route 7, Falls Church	WMATA	8	Yes	Yes	Metrobus, Private Shuttles
West Falls Church Metrorail Station (north side)	I-66 at Route 7, Falls Church	WMATA	9	No	Yes	Metrobus, Fairfax Connector, Washington Flyer
Tysons Corner Center Bus Stop	Tysons Center Ring Road, south side of mall	Tysons Corner I	4	No	No	Metrobus, Fairfax Connector
Tysons-West*Park Transit Station	8300 Jones Branch Road, McLean	Fairfax County	10	Yes	No	Metrobus, Fairfax Connector
Reston East	1860 Wiehle Avenue, Reston	Fairfax County	8	Yes	Yes	Fairfax Connector, RIBS, Private Shuttles
Reston North (overflow parking for Reston East)	Sunset Hills Road at Wiehle Avenue, Reston	VDOT	2	No	Yes	Fairfax Connector, RIBS
Reston South	Reston Parkway at Fox Mill Road, Reston	Fairfax County	3	Yes	Yes	Fairfax Connector, RIBS
Reston Town Center	Explorer Street between Market Street and Bluemont Way, Reston	Fairfax County	2	No	No	Fairfax Connector, RIBS
Herndon-Monroe	1230 Sunrise Valley Drive, Herndon	Fairfax County	8	Yes	Yes	Fairfax Connector, RIBS
Dulles North Transit Center	Route 606 at Route 789, Loudoun County	VDOT	6	Yes	Yes	Loudoun County Express Bus

6.1.2.3 Other Transit Services

Aside from fixed route service provided by WMATA and each of the counties, a few other transit services operate in the corridor. The Potomac and Rappahannock Transportation Commission (PRTC)—which operates the Virginia Railway Express (VRE) commuter rail service between Northern Virginia and Washington, D.C.—also provides weekday commuter bus service between Manassas and Washington, D.C., with an hourly stop at the West Falls Church Metrorail Station. The City of Falls Church initiated its own bus service in late 2000 with two circulator routes linking the East and West Falls Church Metrorail stations with Seven Corners and several Falls Church locations. The City of Fairfax's City-University-Energysave (CUE) bus system provides fixed-route service between the Vienna/Fairfax- George Mason University (GMU) Metrorail Station, George Mason University, and other locations in the City of Fairfax.

In addition to Metrobus and Metrorail services, WMATA provides demand-response MetroAccess paratransit service throughout the Washington metropolitan region. MetroAccess provides curb-to-curb service to persons with disabilities who cannot access public transportation and have been certified as eligible to use paratransit service. MetroAccess service is provided through contract with local operators.

Loudoun Transit is a private not-for-profit operator providing limited fixed route bus service in Leesburg and advance registration on-demand transportation in Leesburg and the Sterling areas.

Washington Flyer coach service is operated by the Metropolitan Washington Airports Authority (MWAA) and provides scheduled shuttle service between Dulles Airport and the West Falls Church Metrorail Station every half-hour.

6.1.3 LONG-TERM EFFECTS

Two of the major goals of the Dulles Corridor Rapid Transit Project, as outlined in Chapter 1 of this document, are to increase transit ridership and improve transportation service in the corridor. This section presents the anticipated long-term effects of the No Build Alternative, the Wiehle Avenue Extension, and the full LPA on the Dulles Corridor transit system and highlights the effectiveness in meeting these goals.

Both the Wiehle Avenue Extension and full LPA meet these goals more effectively than the No Build Alternative. The full LPA is the most effective in meeting these goals.

6.1.3.1 Transit Ridership

The change in ridership resulting from implementation of the rapid transit service in the Dulles Corridor is a measure of fundamental importance in assessing the transit effects of the Wiehle Avenue Extension and full LPA. The potential influences of the Wiehle Avenue Extension and full LPA on regional transit ridership, ridership at proposed stations in the corridor, and the transit mode share in the corridor, in relation to the No Build Alternative, are discussed below.

While the Wiehle Avenue Extension and the full LPA would both increase ridership and mode share compared to the No Build Alternative, the full LPA would result in the greatest increases. The full LPA is projected to attract 41,600 new average weekday trips to the regional transit system in its opening year (2015) while the Wiehle Avenue Extension would attract 29,100 in its opening year (2011). In 2025, the full LPA would attract nearly 47,800 new average weekday trips to the regional transit system while the Wiehle Avenue Extension would attract 34,300 new trips (38 percent fewer new trips). The full LPA is projected to increase the transit mode share at various activity centers in the corridor by 3 to 5 percent. The Wiehle Avenue Extension would result in a mode share increase that is 1 to 2 percent lower.

6.1.3.2 Regional Transit Ridership

Table 6.1-3 presents the average weekday ridership estimates associated with the Wiehle Avenue Extension and full LPA in relation to the No Build Alternative. The first two rows of the table present ridership related specifically to the Dulles Corridor, while the remaining four rows present forecast activity for the entire Washington metropolitan region.

Table 6.1-3: Average Weekday Transit Patronage Forecasts

		Locally Preferred Alternative							
		Wiehle Avenue Extension (2011)				Wiehle Avenue Extension (2025)			
	No Build Alternative (2025)	No Build Alternative	Metro-rail	Corridor Express Bus	Total	Metro-rail	Corridor Express Bus	Total	Full LPA (2025)
Project-Related Corridor Ridership Activity									
Total Corridor Trips	n.a.	n.a.	59,000	3,800[1]	62,800	68,500	4,800[1]	73,300	91,200
Total Corridor Boardings	n.a.	n.a.	24,600	13,200	37,800	27,300	16,800	44,100	57,500
Project-Related Regional Ridership Activity									
Regional HBW Rail/ Corridor Express Bus	541,100	471,400		490,600	n.a.		563,500	n.a.	575,300
Regional Total Rail/ Corridor Express Bus	914,500	788,400		826,500	n.a.		960,600	n.a.	977,300
Regional Total Transit Trips	1,331,200	1,159,500		1,188,600	n.a.		1,365,600	n.a.	1,379,000
Regional New Trips	n.a.	n.a.		29,100	n.a.		34,400	n.a.	47,800

HBW – home-based work

[1] This figure represents ridership activity that occurs on express bus only with no transfer to rail. Trips that start with express bus but also involve utilization of Metrorail are included in the Metrorail column.

The "Total Corridor Trips" row reflects all corridor-related boardings and alightings for the Metrorail system and/or corridor express bus service, including passengers entering the system outside of the corridor but exiting at a corridor station or stop. "Total Corridor Boardings" represent all trips that board the system at a station within the Dulles Corridor.

The "Regional Home Base Work Trips (HBW) Rail/Corridor Express Bus Trips" row represents total daily regional rail or corridor express bus trips that begin at the trip maker's home and end at their place of work. Home-based work trips are an important set of trips to consider in ridership analysis because trips between home and work comprise the largest segment of public transportation use. The "Regional Total Rail/Corridor Express Bus Trips" row represents all daily Metrorail and/or corridor express bus trips, not just those used for the commute between home and work. "Regional Total Transit Trips" reflects forecast ridership on the assumed regional transit network, and includes Metrorail trips, corridor express bus trips, commuter rail trips, and trips made by local bus. The "Regional New Trips" column presents the number of new transit trips attracted to the regional transit network as a result of the implementation of each alternative. The number of new trips for an alternative is calculated by subtracting the No Build Alternative "Regional Total Transit Trips" from the alternative's "Regional Total Transit Trips" for the same year of analysis.

The No Build Alternative would not provide additional rapid transit service in the Dulles Corridor; therefore, there would be no project-related effects from this alternative.

The Wiehle Avenue Extension and the full LPA are expected to increase the number of regional transit trips, and substantially increase the number of new trips on the system. Overall, in 2025, the full LPA would result in approximately 47,800 new average weekday trips on the system. Considered alone, the Wiehle Avenue Extension would attract approximately 34,400 new average weekday trips in 2025.

The Wiehle Avenue Extension would generate fewer corridor boardings than the full LPA due to the required transfer at Wiehle Avenue for many trips and the reduced attractiveness of corridor express bus service to many riders (relative to rail). Considered alone, the Wiehle Avenue Extension is projected to generate approximately 81 percent of the total 2025 daily corridor boardings as compared to the full LPA (including corridor express bus riders). Approximately 13,400 fewer regional new trips would be attracted to the regional transit system in 2025 for the Wiehle Avenue Extension. The Wiehle Avenue Extension has fewer regional total transit trips in its opening year than the No Build Alternative in 2025. This difference occurs because regional growth in population and employment by 2025 would significantly increase regional transit ridership with or without the Dulles Corridor improvements.

A. Daily Station Boardings

Corridor-specific transit ridership is an important measure of the impact of the Wiehle Avenue Extension and full LPA within each station area in the corridor. The estimated number of daily boardings at proposed corridor stations is shown in Table 6.1-4.

Table 6.1-4: Forecast Daily Station Boardings in Dulles Corridor

		Locally Preferred Alternative				
		Wiehle Avenue Extension (2011)		Wiehle Avenue Extension (2025)		Full LPA (2025)
	No Build Alternative	Metrorail	Corridor Express Bus	Metrorail	Corridor Express Bus	Metrorail
Tysons East	n.a.	3,803	n.a.	3,920	n.a.	4,092
Tysons Central 123	n.a.	5,209	n.a.	5,726	n.a.	6,067
Tysons Central 7	n.a.	3,306	n.a.	3,595	n.a.	3,838
Tysons West	n.a.	4,002	n.a.	4,391	n.a.	4,627
Wiehle Avenue	n.a.	8,244	n.a.	9,697	n.a.	6,498
Reston Parkway	n.a.	n.a.	n.a.	n.a.	n.a.	4,708
Reston Town Center	n.a.	n.a.	1,546	n.a.	1,534	n.a.
Herndon-Monroe	n.a.	n.a.	4,746	n.a.	5,531	8,775
Route 28	n.a.	n.a.	n.a.	n.a.	n.a.	1,226
Dulles Airport	n.a.	n.a.	3,466	n.a.	4,986	6,200
Route 606	n.a.	n.a.	1,485	n.a.	1,661	4,485
Route 772	n.a.	n.a.	1,973	n.a.	3,110	6,961

n.a. = not applicable – no stations exist at those locations for the alternative.

As the data in the table show, a higher number of boardings occur in the full LPA in 2025 versus the Wiehle Avenue Extension in 2025, especially for the outer stations being served by corridor express service in the Wiehle Avenue Extension. Heavy boardings in the Wiehle Avenue Extension at Wiehle Avenue reflect the fact that it will be the interim terminal station prior to the completion of the full LPA. These high numbers decline under the full LPA, with higher boardings occurring at Herndon-Monroe in the full LPA. With direct service to Herndon-Monroe, Herndon-Monroe is a more logical station for riders coming from Reston and Herndon, and therefore results in an increase in boardings. A very significant increase in boardings at Route 606 and 772 under the full LPA reflect the increased attractiveness of rail versus corridor express bus service. Heavy boardings in Tysons, especially at Tyson Central 123 reflect

high employment densities in the area as well as the fact that this station is the nexus for Tysons shuttle services.

B. Corridor Transit Mode Share

Changes in transit mode share identify whether overall corridor travel choices are changing because people have switched to transit from their automobiles due to the presence of the new corridor rapid transit service. Transit mode share analysis distinguishes between absolute transit volumes and the overall effectiveness of transit service in meeting regional travel needs. If transit ridership goes up while its mode share declines, then transit is not succeeding in contributing to the performance of the overall regional transportation system.

The effects of the Wiehle Avenue Extension and full LPA on corridor transit mode share, in relation to the No Build Alternative, are summarized below in Tables 6.1-5 and 6.1-6.

Table 6.1-5: Transit Mode Share for Home-Based Work Trips (Trips Attracted to the Dulles Corridor)

		Locally Preferred Alternative		
	No Build Alternative (2025)	Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Tysons Corner	8.4%	11.9%	11.6%	12.6%
Reston	6.4%	7.9%	7.6%	9.6%
Herndon/Dulles	4.4%	5.8%	6.2%	7.9%
Loudoun East	1.0%	2.0%	2.1%	2.7%

Table 6.1-6: Transit Mode Share for Home-Based Work Trips (Trips Produced in the Dulles Corridor)

		Locally Preferred Alternative		
	No Build Alternative (2025)	Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Tysons Corner	25.9%	33.5%	34.3%	34.4%
Reston	11.7%	15.1%	15.4%	17.4%
Herndon/Dulles	10.8%	13.9%	14.8%	16.2%
Loudoun East	2.9%	6.9%	6.8%	10.8%

Relative to the No Build Alternative, home-based work transit mode share for the full LPA would increase in each of the corridor sub areas due to the implementation of a much more attractive transit service than the bus only service provided in the No Build Alternative.

The Wiehle Avenue Extension would result in less improvement in home-based work transit mode share at activity centers than the full LPA, especially in the western end of the corridor, due to a lower overall ridership. However, in the eastern end of the corridor the increase in mode share for the Wiehle Avenue Extension would result in a significant improvement over No Build Alternative mode shares.

C. Transit Travel Times

The level of convenience for passengers using transit is directly related to the amount of time that is required to make a trip by bus or rail versus alternative modes such as the automobile. Transit travel time includes time spent accessing the station or stop, time spent waiting for the bus or train, time spent riding

the bus or train, and the time spent transferring between transit services. The longer each of these transit trip components take, the less attractive transit becomes relative to other modes for travelers who have a choice of mode. For passengers who do not have access to other modes and thus rely on transit to meet their basic mobility needs, excessive travel times result in less time available to spend on other priorities. Table 6.1-7 shows transit travel times for the No Build Alternative, the Wiehle Avenue Extension, and the full LPA in 2025 for select origin/destination (O/D) pairs within the region.

Table 6.1-7: Transit Travel Times for Select O/D Pairs in Minutes

		No Build Alternative		Locally Preferred Alternative		
Origin	**Destination**	**Highway (2025)**	**Transit (2025)**	**Wiehle Avenue Extension (2011)**	**Wiehle Avenue Extension (2025)**	**Full LPA (2025)**
Tysons West – West*Park Area	Metro Center	35	37	38	38	38
Wiehle Avenue	Union Station	59	57	57	57	51
Rosslyn	Dulles Airport	36	64	54	54	43
Wiehle Avenue	Pentagon	57	50	57	57	55
Herndon-Monroe	Tysons Central 123	26	42	28	28	26
Tysons West – Tysons West Station Area	Dulles Airport	21	72	30	30	19
Wiehle Avenue	Tysons East – Tysons East Station Area	25	46	26	26	19
Route 606	Metro Center	52	60	65	65	60

For all but three origin-destination (O/D) pairs, the full LPA would improve transit travel times over those for the No Build Alternative, especially for reverse commute trips and trips with one end in Tysons Corner. For many trips, transit travel times would improve by 20 to 30 minutes. The transit travel times for the full LPA would generally be time-competitive with highway travel (travel by private vehicle).

In general, the Wiehle Avenue Extension would offer less travel time savings than the full LPA, but it would still offer an improvement in transit travel times over the No Build Alternative for most O/D pairs. For trips traveling between Wiehle Avenue and points east, the Wiehle Avenue Extension would provide travel times similar to the full LPA, because the Metrorail service would be similar in this portion of corridor. For trips with at least one end west of Wiehle Avenue, the Wiehle Avenue Extension would have greater travel times than the full LPA due to transfer requirements and decreased service frequency in the reverse peak direction. For these trips, the Wiehle Avenue Extension would generally have travel times that are 10 to 15 minutes longer than the full LPA.

6.1.3.3 Effects on Travel Patterns

The data presented in this section complements the mode share data presented above in Tables 6.1-5 and 6.1-6. The purpose of this data is to show the changes in trips being generated and attracted to different parts of the corridor due to the implementation of the full LPA or the Wiehle Avenue Extension. Specifically, the data show the impacts on mode choice of a greater range of transit options for people

starting trips in the corridor as well as for people making trips into the corridor. Tables 6.1-8 and 6.1-9 show the number of daily transit trips attracted to and produced in the Dulles Corridor.

Table 6.1-8: Number of Daily Transit Trips Attracted to Corridor Geographic Areas

		Locally Preferred Alternative		
	No Build Alternative (2025)	Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Tysons Corner	13,870	19,335	20,514	21,981
Reston	7,942	9,382	9,168	10,888
Herndon/Dulles	5,449	5,722	6,808	8,282
Loudoun East	3,133	8,742	12,758	15,389

Table 6.1-9: Number of Daily Transit Trips Produced in Corridor Geographic Areas

		Locally Preferred Alternative		
	No Build Alternative (2025)	Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Tysons Corner	6,034	8,908	9,732	9,787
Reston	11,980	13,333	14,786	16,068
Herndon/Dulles	7,793	8,104	9,556	10,602
Loudoun East	6,505	9,450	13,359	17,955

With implementation of the Wiehle Avenue Extension and the full LPA, trip productions and attractions for all parts of the corridor show increases with the most dramatic increases in trips in the westernmost part of the corridor. While this increase is especially notable in the full LPA, increases in the Wiehle Avenue Extension are also significant. These increases are directly related to providing greater transit choices in the corridor, especially for reverse commute and off-peak trips.

6.1.3.4 Transit Capacity

Transit capacity in the corridor represents the amount of physical capacity available to carry passengers and provides an understanding of the number of riders that can be comfortably accommodated in the corridor during peak travel times. This measure also provides an understanding of the level of service provided and how well the Wiehle Avenue Extension and full LPA support the corridor's mobility needs. Total capacity will vary according to the number of vehicles in service and the capacity of each of those vehicles. Vehicle capacity, in turn, will vary based on vehicle size, policies regarding the level of acceptable vehicle loading, and the allowable number of standing passengers.

Table 6.1-10 summarizes the transit capacity provided at each of the corridor stations or stops (or station areas in the No Build Alternative) for service in the a.m. peak hour in the peak direction. The figures in the table represent the number of peak-hour spaces available to carry passengers at each station or station area under each alternative.

Table 6.1-10: Transit Capacity by Alternative in the a.m. Peak Hour

Station/Stop	No Build Alternative (2025)	Locally Preferred Alternative		
		Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
East Falls Church	21,120	18,240	21,120	21,120
West Falls Church	21,120	10,560	12,480	12,480
Tysons East	90	7,680	8,640	8,640
Tysons Central 7	n.a.	7,680	8,640	8,640
Tysons Central 123	400	7,680	8,640	8,640
Tysons West	n.a.	7,680	8,640	8,640
Wiehle Avenue	720	7,860	8,820	8,820
Reston Parkway	n.a.	n.a.	n.a.	8,640
Herndon-Monroe	1,012	1,665	2,430	8,640
Route 28	n.a.	n.a.	n.a.	8,640
Dulles Airport	n.a.	180	180	8,640
Route 606	495	2,295	2,565	8,955
Route 772	n.a.	1,980	2,250	8,640

NOTE: Vehicle Capacity Assumptions: Metrorail – 120 passengers per vehicle; Fairfax Connector and Loudoun County – 45 passengers per vehicle (assumes some standees).
n.a. = transit services not provided to this station area under the alternative.

In the full LPA, transit capacity at all stations in the corridor between Route 772 and Tysons East would increase relative to the No Build Alternative because the multiple car trains in the full LPA would provide significantly higher capacity than the single buses providing corridor service under the No Build Alternative (furthermore, a single rail car also has a higher capacity than a single bus).

In the Wiehle Avenue Extension, similar improvements in transit capacity would occur relative to the No Build Alternative for the corridor stations from Wiehle Avenue east (in the Wiehle Avenue Extension, Wiehle Avenue will be the western terminal station for the Wiehle Avenue Extension rail service). This improvement in capacity would occur both in the short term as well as in the long term, if the full LPA is not implemented in its entirety. In the Wiehle Avenue Extension, west of Wiehle Avenue, transit capacity would be much less than the full LPA because transit service would be provided by buses (i.e., single vehicles) rather than by multiple car trains. In 2025, the Wiehle Avenue Extension would provide approximately 30 percent of the capacity of the full LPA west of Wiehle Avenue.

6.1.3.5 Hours of Operation and Frequency of Service

Hours of operation and service frequency, especially in the off-peak, are important determinants of the quality and convenience of transit service that would be provided in the Dulles Corridor, including how well transit supports everyday activities and travel needs other than peak hour commutes.

For the Wiehle Avenue Extension, hours of operation for both Metrorail and corridor express bus services would correspond to the existing Metrorail system's operating hours: 5:00 a.m. to 12 p.m. on weekdays (3 a.m. on Friday), 7 a.m. to 3 a.m. on Saturdays, and 7 a.m. to 12 p.m. on Sundays. In addition, overall span of service for local/feeder bus services would correspond to these operating hours. Limited "night

owl" bus service operates beyond these hours throughout the region. For the full LPA, the Dulles Corridor line would have the same hours of operation as described for the Wiehle Avenue Extension.

While the hours of operation are comparable between the No Build Alternative, the Wiehle Avenue Extension, and the full LPA, service frequencies—particularly in the off-peak periods (midday and evening)—would be much better for the full LPA than for the No Build Alternative. Table 6.1-11 summarizes the range of service frequencies planned for each alternative in both the peak and off-peak periods.

The service frequencies for the full LPA were designed to be consistent with planned Metrorail operations. Accordingly, the full LPA would operate with 7-minute headways in the peak period and 12-minute headways at most other times. In the peak period, this level of service is better than what would be provided under the No Build Alternative, and in the off-peak period—where headways for most travel markets in the corridor improve from 30 minutes to 12 minutes—the level of service would be far better than that provided by the No Build Alternative.

Table 6.1-11: Peak and Off-Peak Headways in the Dulles Corridor (in minutes)

			Locally Preferred Alternative		
		No Build Alternative (2025)	Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Peak Period	Fairfax County Connector Service	5-30	15-30	15-30	15-30
	Loudoun County Commuter Service	15	15	15	No Service
	Metrorail	No Service	7	7	7
	Metrobus	15-30	15-30	15-30	15-30
	Corridor Express Bus Service	No Service	7-30	7-30	No Service
Off-Peak Period	Fairfax County Connector Service	30-60	30-60	30-60	30-60
	Loudoun County Commuter Service	No Service	No Service	No Service	No Service
	Metrorail	No Service	12	12	12
	Metrobus	30-60	30-60	30-60	30-60
	Corridor Express Bus Service	No Service	21-30	21-30	No Service

For the Wiehle Avenue Extension, the frequency of service east of and including Wiehle Avenue would be the same as that for the full LPA. The corridor express bus service proposed for points west of Wiehle Avenue is intended to operate in the peak direction with frequencies comparable to those provided by the rail segment. However, express bus services would operate in heavily congested conditions when accessing and exiting stations and stops, and could experience delays that affect service reliability. In the reverse-peak direction and during the off-peak period, express bus service would operate less frequently than the full LPA, but more frequently than No Build Alternative transit services.

6.1.3.6 Transfer Requirements

The number of transfers required to make a trip from an origin to a destination is one of the most important determinants of passenger convenience and comfort. Research shows that there are several reasons transfers decrease the attractiveness of a transit service. First, the added time associated with transfers increases a passenger's overall trip time. Second, transfers between different transit lines often take place at bus stops that are unprotected from the elements and not suited to long waits. Third, there

is a discomfort associated with uncertainty about the arrival of the vehicle being transferred to, specifically whether the vehicle will be early (and therefore missed by on-time arriving passengers), late, or will arrive at all.

For the No Build Alternative, the Wiehle Avenue Extension, and the full LPA, the minimum number of transfers necessary to travel between select O/D pairs (the same pairs analyzed for travel time effects) was determined. The results of this analysis show that for most of the O/D pairs analyzed, the full LPA would require fewer transfers than the No Build Alternative. The full LPA would often provide a one-seat ride between origin and destination. Where transfers are required, they would be within the regional rapid transit system; therefore, perceived transfer "penalties" are somewhat mitigated by completely sheltered environments and the ability to transfer between lines without paying an additional fare or showing a transfer pass.

The Wiehle Avenue Extension would require at least one more transfer than the full LPA for trips with one end in the western part of the corridor and one end east of Wiehle Avenue. For these trips, the Wiehle Avenue Extension would generally require the same number of transfers as transit services operating under the No Build Alternative, but in most cases would not require transfers between different service providers. For O/D pairs with both ends in the western end of the corridor, no transfers would be required.

6.1.3.7 Effects on Regional Rail Operations

The implementation of the Wiehle Avenue Extension and full LPA would affect the operations of other portions of the regional transit system, including Metrorail, Metrobus, and the local operating systems in the corridor. This section includes a summary of the effects of the full LPA on planned Metrorail system capacity and operations. Of particular concern is the ability of Metrorail vehicles to accommodate additional passenger loads resulting from the implementation of the Dulles Corridor Rapid Transit Project without significant crowding, especially in the peak hour of demand. The operations of the Wiehle Avenue Extension and full LPA are discussed in Section 2.4.2.

A. Passenger Volumes at Maximum Load Points

Table 6.1-12 presents forecasted Metrorail passenger loads at the maximum load point (the point at which Metrorail vehicles experience the highest passenger volumes and thus the most crowding), and the average loads per car during the peak hour of the a.m. peak period for the No Build Alternative, the Wiehle Avenue Extension, and the full LPA. The maximum load point for each alternative would occur between the Rosslyn and Foggy Bottom stations on the Metrorail Orange Line. The average load per car reflects the number of passengers carried on each car of a train during the peak hour, assuming that passenger loads are spread evenly among all cars in operation during that period.

WMATA's current primary passenger load guideline is 140 passengers per rail car (ppc) in the peak direction during the peak 30-minute period (i.e., the peak of the peak). In an effort to improve the quality of Metrorail service, WMATA has established an objective of reducing its passenger load standard to 120 ppc in the peak hour. This passenger load guideline was used in WMATA's Core Capacity Study (see Section 1.3) and in determining Metrorail fleet requirements for the Dulles Corridor Rapid Transit Project.

Table 6.1-12: A.M. Peak Hour Maximum Loads and Average Loads per Vehicle

	No Build Alternative (2025)		Locally Preferred Alternative					
			Wiehle Avenue Extension (2011)		Wiehle Avenue Extension (2025)		Full LPA (2025)	
	Passenger Load	Average Load/Car	Passenger Load	Average Load/Car	Passenger Load	Average Load/Car	Passenger Load	Average Load/Car
Orange Line, Vienna to Largo	3,726	109	3,185	124	3,383	99	3,358	98
Orange Line, Vienna to New Carrollton	7,483	110	6,398	107	6,791	99	6,738	98
Orange Line, West Falls Church to Stadium	5,194	76	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.
Wiehle Avenue Extension and full LPA	n.a.	n.a.	6,845	114	7,389	108	8,642	126
Total	**16,404**	**96**	**16,428**	**112**	**17,563**	**103**	**18,738**	**109**

n.a. = not applicable for this alternative

Passenger loads on the Orange Line Vienna service would decrease under the full LPA relative to the No Build Alternative because passengers from the Dulles Corridor riding the Vienna service under the No Build Alternative would instead board the service provided by the Wiehle Avenue Extension or full LPA, thus lessening the number of passengers on board Vienna Line trains. Under the Wiehle Avenue Extension, passenger loads and average loads per car on the Dulles Corridor line would decrease at the maximum load point relative to the full LPA. This decrease would be attributable to the decrease in ridership on the Dulles Line for the Wiehle Avenue Extension. Conversely, there would be a small increase in passenger loads and average loads per car on the Orange Line Vienna service for the Wiehle Avenue Extension in 2025. Since Metrorail service would not be available in the western portion of the corridor under the Wiehle Avenue Extension, some people from the west would choose to drive to the Vienna line to board rather than be forced to transfer at Wiehle Avenue on the Dulles Line. The decrease in passengers on board at the maximum load point and the average loads per car in the full LPA are even more pronounced relative to the Wiehle Avenue Extension opening year.

B. Other Effects on the Existing Metrorail System

Implementation of the full LPA would result in two additional effects on Metrorail service along the Orange Line. The Wiehle Avenue Extension and the full LPA would replace Orange Line service running between West Falls Church and Stadium Armory in the peak period only with new Metrorail service in the Dulles Corridor and along the Orange Line, with the first Orange Line stop for the new Dulles service at the East Falls Church Metrorail Station. Because the Dulles line service would operate all day, service frequencies along the Orange Line (east of East Falls Church) would improve during the off-peak period, as Dulles trains would merge with the Orange Line alignment at East Falls Church. This would result in a combined off-peak headway of 6 minutes from East Falls Church to Rosslyn and 4 minutes along the remainder of the shared Orange/Blue alignment through downtown Washington, D.C. By comparison, the No Build Alternative would provide a 12-minute off-peak headway on the Orange Line east to Rosslyn and a 6-minute combined Blue/Orange Line headway through downtown Washington, D.C.

While off-peak service frequencies east of (and including) East Falls Church Metrorail Station would improve, peak period service at the West Falls Church Metrorail Station would decline under the implementation of the Wiehle Avenue Extension and the full LPA. This is because the Wiehle Avenue

Extension and the full LPA would replace a service (the peak period only Orange Line service between West Falls Church and Stadium-Armory) with a Metrorail Line that would bypass West Falls Church and enter the Orange Line alignment at the East Falls Church Metrorail Station. This would result in peak period trains at West Falls Church being reduced from approximately 21 trains per hour in the No Build Alternative to approximately 13 trains per hour under the Wiehle Avenue Extension and full LPA.

6.1.3.8 Effects on Operations and Maintenance Costs

The ridership figures outlined at the beginning of Section 6.1.3 show the positive impacts of implementing a major transit capital investment in the Dulles Corridor. This section outlines the estimated changes in operations and maintenance (O&M) costs associated with the Wiehle Avenue Extension and full LPA. These figures, in conjunction with ridership changes, help to identify the cost-effectiveness of a given alternative. Table 6.1-13 presents the annual operations and maintenance costs estimated for 2025 (in 2004 dollars).

Table 6.1-13: Annual Operations and Maintenance Costs – 2025 (2004 dollars in millions)

		Locally Preferred Alternative		
Transit Service	**No Build Alternative (2025)**	**Wiehle Avenue Extension (2011)**	**Wiehle Avenue Extension (2025)**	**Full LPA (2025)**
Metrorail	$587.73	$581.98	$627.85	$657.64
WMATA Bus	$14.53	$11.74	$13.30	$13.30
Fairfax Connector	$19.19	$19.74	$23.42	$21.32
Loudoun County (includes corridor express service)	$4.38	$7.96	$9.71	$6.33
TOTAL	**$625.83**	**$621.42**	**$674.28**	**$698.59**

NOTE: See Chapter 8 for costs expressed in year-of-expenditure dollars.

Though revenue vehicle hours for all transit modes in the corridor are expected to decrease for the full LPA relative to the Wiehle Avenue Extension, the full LPA would have higher O&M costs due to the added cost of infrastructure maintenance for a rail line which extends to Loudoun County. This infrastructure includes stations, tracks, power distribution systems, structures, and right-of-way. The cost associated with maintaining more sophisticated rail vehicles is also higher than the cost of maintaining buses (the mode of service west of Wiehle Avenue in the Wiehle Avenue Extension).

6.1.3.9 Metrorail Fleet Requirements

Fleet requirements represent the number of Metrorail cars that would be required to meet peak loads under each of the alternatives, plus spare cars and gap trains. This measure is another means of describing the level of transit service and investment in resources. Table 6.1-14 presents the fleet requirements for each alternative in the opening years.

Table 6.1-14: Fleet Requirements – Opening Year

Transit Service	**No Build (2011)**	**Wiehle Avenue Extension (2011)**	**No Build (2015)**	**Full LPA (2015)**
Metrorail Cars	1,108	1,172	1,238	1,366

As shown in the table, the Wiehle Avenue Extension alternative requires an additional 64 Metrorail cars for year 2011 operations when compared to the No Build Alternative. The full LPA requires an additional

64 Metrorail cars. Independent of the LPA, WMATA will procure a gap train and also rail cars to accommodate growth in the system.

6.1.4 CONSTRUCTION EFFECTS

6.1.4.1 Wiehle Avenue Extension

The Wiehle Avenue Extension would merge with the Orange Line at a point between the East and West Falls Church Metrorail Stations. This connection would require new special track work, including turnouts and a double crossover on the existing Orange Line track. It would also require some re-alignment of the Orange Line. WMATA would be able to maintain Orange Line operations by single-tracking trains to implement such improvements. To the extent possible, overnight periods would be utilized for construction that would require closure of both tracks. If closure of both tracks is required during operating hours, buses would be used to connect stations affected by the closure.

A yard lead from the mainline in the median of the Dulles Connector Road would be required for access to the West Falls Church Yard. This lead would cross under the eastbound lanes of the Connector Road. If cut and cover tunneling is identified as the best method for constructing the tunnel it would require a detour on the eastbound lanes.

In Tysons Corner, the rail line would run in tunnel for 1.1 miles. If cut and cover is the selected construction method, lane closures that would have a considerable impact on traffic operations would be required.

Construction of the Wiehle Avenue station would require widening of the DIAAH. This widening would result in lane closures in the station area. The construction impacts of parking, Kiss & Ride and bus facilities associated with the station are expected to be minimal. The construction of pedestrian overpasses to the Wiehle Avenue median station may require limited off-peak lane closures on the DIAAH and the Dulles Toll Road.

West of the Wiehle Avenue Station, there would be construction of a pocket track for train storage that would result in lane closures for roadway widening.

6.1.4.2 Full LPA

Construction effects for the full LPA would be the same as the Wiehle Avenue Extension east of and including Wiehle Avenue.

West of Wiehle Avenue, the construction of the Reston Parkway, Herndon-Monroe, and Route 28 stations would require the same widening of the DIAAH as the Wiehle Avenue station construction, and therefore would also have the same impacts.

At Dulles Airport, the rail alignment would run through a 1.72 mile tunnel. Impacts from the use of a combination of cut and cover and conventional tunneling techniques would include vehicular, pedestrian, and potentially air traffic disruptions as the tunneling proceeds across roads leading to the main terminal, parking lots, and the northern portion of the service tarmac.

The northwestern-most section of the Dulles Airport alignment would be an aerial alignment providing a connection to the Dulles Greenway median. Impacts due to construction are expected to be minimal, with some off-peak lane closures across the eastbound lanes expected.

Relocation of lanes on the Dulles Greenway would be required at the Route 606 and Route 772 stations in Loudoun County. These relocations may result in some traffic disruptions as lanes are closed at each station location. Impacts from lane closures for construction of pedestrian bridges to the Greenway median are expected to be minimal.

6.1.5 MITIGATION

Maintenance of traffic plans would be developed for all construction activities that would affect roadways. The construction of all stations along the alignment of both the full LPA and the Wiehle Avenue Extension would be coordinated with the following agencies: VDOT regarding lane closures in Tysons Corner and on the Dulles Toll Road; MWAA regarding possible disruptions in airport service and construction on the DIAAH; and with TRIP II regarding construction events on the Dulles Greenway. To the extent possible, all construction requiring lane closures would be done at night, on weekends, or in the off-peak periods.

6.2 EFFECTS ON ROADWAYS

Because of the population and employment growth forecast for the metropolitan Washington, D.C. region, traffic is expected to consistently increase throughout the Dulles Corridor over the next ten to 20 years. Under the No Build Alternative, anticipated growth is expected to occur in a dispersed pattern of development, which would be highly auto-oriented, leaving people with few travel choices and resulting in widespread congestion. At many corridor intersections, travelers would experience substantial delays and very poor levels of service. The intent of the Dulles Corridor Rapid Transit Project is to provide travel choices for corridor residents and employees and to help focus anticipated growth in Fairfax and Loudoun counties into patterns that will increase the number of viable travel options available to corridor residents and employees, including transit, walking, and bicycling.

This section presents the existing and planned roadway system in the Dulles Corridor, as well as the potential effects of the Wiehle Avenue Extension and the full LPA on the planned system. In Section 6.2.1, the methodology for evaluating roadway effects is discussed, then in Section 6.2.2 the existing and planned roadway systems in the Dulles Corridor are described. Section 6.2.3 presents the anticipated long-term effects associated with the No Build Alternative, the Wiehle Avenue Extension, and the full LPA in terms of roadway volumes, levels of service, and anticipated delay at intersections, and Section 6.2.4 presents proposed mitigation measures for anticipated adverse traffic effects.

6.2.1 METHODOLOGY

Like transit effects, the anticipated effects of the No Build Alternative, the Wiehle Avenue Extension and the full LPA on the regional and corridor roadways were estimated using the Northern Virginia Major Investment Study Model (NVMISM). NVMISM was used to generate highway assignments that were, in turn, used to forecast traffic volumes on regional highway links and adjusted to develop detailed traffic forecasts for the local road network surrounding proposed stations and stops in the Dulles Corridor.

6.2.2 EXISTING AND PLANNED ROADWAY SYSTEM

The Dulles Corridor is served by a number of regional and local roadway facilities. This section provides an overview of these facilities, including a general assessment of current traffic operations. Additional information on existing transportation facilities and assumed highway and transit improvements is provided in Chapters 1 and 2.

6.2.2.1 Regional Roadways

The regional highway facilities, major arterials, and key regional roadway links in the Dulles Corridor are shown in Figure 2.4-2. These highways, their existing capacity, and the improvements included in the region's financially constrained long-range transportation plan (CLRP) are described in more detail in Chapter 2. The major regional highway facilities in the corridor include the following:

- Interstate 66 (I-66);
- Dulles Connector Road;
- Interstate 495 (I-495 or Capital Beltway);
- Dulles Toll Road;
- Dulles International Airport Access Highway; and,
- Dulles Greenway.

The other major arterials serving regional travel patterns in the corridor include:

- Route 7 (Leesburg Pike);
- Route 123 (Chain Bridge Road/Dolley Madison Boulevard);
- Route 193 (Georgetown Pike);
- Route 7100 (Fairfax County Parkway);
- Route 28 (Sully Road);
- Route 50 (Lee Jackson Memorial Highway); and,
- Route 607 (Loudoun County Parkway).

As indicated in Chapter 1, regional roadways and major arterials in the Dulles Corridor currently experience a substantial amount of congestion during peak travel periods. Typically, the level of congestion on a roadway or at an intersection is reflected by a qualitative measure called level of service (LOS). In general, LOS reflects the impacts of congestion on travel speeds or the average delay experienced by vehicles at an intersection. Six letter designations (A through F) are used to represent different levels of service, with LOS A reflecting free flow conditions and LOS E and F representing very congested or gridlock conditions. Many of the facilities in the Dulles Corridor are currently at LOS E and F, and increasing demand is only expected to worsen conditions. LOS is explained in more detail in Section 6.2.3 where anticipated highway volumes and LOS for the No Build Alternative are presented.

6.2.2.2 Local Roadways and Intersections

In addition to regional travel functions, the roadways described above, in combination with other roads, provide local circulation within the project corridor. For local travel, intersection operations are a key performance factor. Local transportation facilities in the corridor's activity centers are summarized in the following sections. Particular attention is given to roadways and intersections in the vicinity of proposed stations.

A. Falls Church

Falls Church is located at the eastern end of the Dulles Corridor. In addition to several of the regional roadways discussed earlier, the following major local roadways serve this activity center:

- **Sycamore Street** – Four-lane collector road adjacent to the East Falls Church Metrorail Station, connecting the residential areas of North Arlington with Falls Church;
- **Route 29 (Lee Highway)** – Four-lane east-west roadway serving this portion of the corridor serving as an alternative to I-66;

- **Haycock Road** – Four-lane minor arterial linking Route 29 and Westmoreland Street. The West Falls Church Metrorail Station entrance is off of Haycock Road; and
- **Great Falls Street** – Two-lane minor arterial that intersects Haycock Road and runs to the north and east of the West Falls Church Metrorail Station.

Key intersections in the area of the West Falls Church station currently operate at an acceptable range from LOS A and B with one LOS C in the p.m. peak period. Future traffic growth for the No Build Alternative will result in deteriorating traffic conditions in the area. In 2025, intersection a.m. peak LOS would range from A to E and p.m. peak LOS would range from A to F.

B. Tysons Corner

Tysons Corner is the primary activity center in the Dulles Corridor and the second largest employment center in the Washington metropolitan region. The internal roadway network in Tysons Corner is generally circuitous as opposed to a typical urban grid network. Vehicular access into and out of Tysons Corner is limited to six intersections and interchanges:

- Route 123 at the Dulles Connector Road;
- I-495 at Route 123;
- Route 123 at Route 7;
- Spring Hill Road at the DIAAH and Dulles Toll Road;
- Route 7 at the DIAAH and Dulles Toll Road; and
- Gallows Road at Old Courthouse Road.

The major local roadways within Tysons Corner are summarized below:

- **International Drive** – Six-lane north-south minor arterial linking central Tysons Corner (and two regional shopping malls) with the Dulles Toll Road;
- **Westpark Drive** – Semi-circumferential four-lane minor arterial linking Route 7 on the west with the northeast quadrant of the Tysons Corner area;
- **Tysons Boulevard** – Four to six-lane north-south local road linking the two shopping malls and providing a bypass to the International Drive/Route 123 intersection. The Tysons Boulevard/Route 123 intersection features Virginia's first three-lane left turn movement;
- **Spring Hill Road** – Two to four-lane minor arterial linking International Drive with Route 7, planned for expansion to four lanes along entire length of facility by 2005; and
- **Tyco Road** – Four-lane local roadway connecting Spring Hill Road with Route 7 to the northwest.

The majority of key intersections on the roadway network within the heart of Tysons Corner currently operate at generally poor LOS, with associated high delay. Generally, future growth in traffic in the area in the No Build Alternative resulting from increased development will lead to increases in delay and deteriorating LOS in 2025, even for intersections that operate fairly efficiently today. In instances where an intersection fails today, continued growth in traffic will typically result in significantly increased delays in 2025 compared to the delays that exist today.

C. Reston, Herndon, and Dulles Corner

In the mid-section of the Dulles Corridor, arterials and collectors generally run north-south and east-west, while the clustered residential development in the area results in circuitous local street networks. This section of the corridor includes the following major local roadways:

- **Wiehle Avenue** – Two to four-lane minor arterial currently connecting Sunrise Valley Road south of the Dulles Toll Road with Fairfax County Parkway near Route 7. Wiehle Avenue is being extended west to Dranesville Road;
- **Sunset Hills Road** – Four-lane minor arterial north of, and running parallel to, the Dulles Toll Road between Hunter Mill Road and Fairfax County Parkway;
- **Sunrise Valley Drive** – Four-lane minor arterial south of, and running parallel to, the Dulles Toll Road between Hunter Mill Road and Monroe Street, where it changes names and becomes Fox Mill Road. East of Route 28, the road becomes Horsepen Road;
- **Reston Parkway** – Four to six-lane minor arterial north-south roadway linking Reston communities with the Reston Town Center and other large developments;
- **Monroe Street/Van Buren Street** – Two- to four-lane collector connecting Herndon with western Fairfax County neighborhoods south of the Dulles Toll Road (and just west of the Herndon-Monroe park-and-ride lot). Monroe Street is assumed to be widened to six lanes between Sunrise Valley Drive/Fox Mill Road and Herndon Parkway by 2010; and
- **Centreville Road/Elden Street** – Four-lane minor arterial connecting western Fairfax County neighborhoods south of the Dulles Toll Road with Herndon (where it is named Elden Street). A one-half mile section between Worldgate and Herndon Parkway is assumed for expansion from four to six lanes by 2010.

Most of the major intersections in the Reston, Herndon, and Dulles Corner portion of the corridor currently operate at failing conditions, while some of the area intersections with lower volumes operate at reasonable Levels of Service (LOS B and C). In nearly every instance, future growth in the area under the No Build Alternative will result in deteriorating intersection operations in 2025. For those intersections that are currently failing, delay will increase in the future while those intersections that currently have reasonable operations will generally experience increased delay and in some instances poorer Levels of Service.

D. Dulles Airport

Dulles Airport is located southwest of the interchange for the DIAAH and Dulles Toll Road, the Dulles Greenway, and Route 28. These roadways converge at Dulles Airport, and access to the airport is provided through a diamond interchange with loop access to the eastbound and westbound Dulles Toll Road and DIAAH. Flyover access from northbound Route 28 is provided to Dulles Airport.

E. Eastern Loudoun County

Loudoun County, at the western end of the corridor, is currently rural in nature, with limited, but increasing, commercial and residential development and a somewhat limited local roadway network. Local roadways within the Loudoun County portion of the Dulles Corridor are identified below:

- **Route 606** – Four-lane arterial connecting southeastern Loudoun County with Herndon and northern Fairfax County;
- **Route 789** – Two-lane local road connecting Route 606 with Moran Road. Route 789 is planned for widening to four lanes and an extension north to Ashburn by 2010; and
- **Route 772** – Two-lane local road running south from the Dulles Greenway.

The key existing intersection of Route 606 and Route 789 in the vicinity of the Loudoun County stations currently operates at a LOS B. Future operations in the No Build Alternative deteriorate to Level of Service F due to significant traffic growth associated with increased development.

6.2.3 LONG-TERM EFFECTS

The implementation of the Wiehle Avenue Extension and the full LPA (and the provision or expansion of park-and-ride and Kiss & Ride facilities) would result in increased traffic on local roadways around stations. Park-and-ride and Kiss & Ride facilities are provided at these stations. Stations located in the central business district type environments would have substantially fewer passengers accessing the station via automobile resulting in minimal impacts to traffic in the areas adjacent to those types of stations. Although the full LPA is not expected to substantially affect the operation of regional highway facilities or roadways outside of station areas, it would provide travel options and help to increase overall mobility in the corridor, the counties, and the region.

This section presents the anticipated long-term effects of the No Build Alternative, the Wiehle Avenue Extension, and the full LPA on regional and corridor roadways. Forecast levels of service and delay are discussed for each roadway link and intersection.

6.2.3.1 Regional Highway Operations

LOS is typically used to describe the operation of roadway facilities. LOS is a qualitative measure that describes the flow of vehicles along freeways and arterials, and the apparent ease of movement through intersections. In general, LOS reflects the impacts of congestion experienced by vehicles traveling along a road or through an intersection. This delay reflects a combination of factors, such as speed, travel time, traffic interruptions, and driving comfort. In its *Highway Capacity Manual* (2000), the Transportation Research Board defines LOS characteristics and conditions for multilane highways and freeways. These characteristics are summarized in Table 6.2-1.

Six letter designations (A through F) are used to represent different levels of service. LOS A typically reflects free flow conditions, while LOS B and LOS C are generally considered declining, but acceptable, traffic conditions. LOS D represents moderate delays. LOS E represents traffic volumes approaching the capacity of the roadway, and LOS F reflects stop-and-go, near-gridlock traffic conditions.

Table 6.2-1: Multilane Highway and Freeway Level of Service Characteristics

LOS	Speed Characteristics	Multilane Highway Conditions	Freeway Conditions
A	Free-flow speeds	Uncongested or no delay	Uncongested or no delay
B	Free-flow speeds	Reasonably unimpeded flow Presence of other vehicles a noticeable influence on ability to maneuver	Reasonably unimpeded flow Maneuverability is slightly restricted
C	At or near free-flow speeds	Moderately congested Other vehicles a strong influence, ability to maneuver is noticeably restricted	Moderately congested Maneuverability is noticeably restricted, significant incidents could cause queues
D	Speeds are reduced moderately	Congested Ability to maneuver severely restricted	Congested Ability to maneuver more restricted, psychological comfort reduced, minor incidents expected to cause queues
E	Speeds highly variable and can be greatly reduced	Very congested Queues can form readily	Very congested Vehicles closely spaced, ability to maneuver severely restricted, poor psychological comfort, minor incidents will cause extensive queuing

LOS	Speed Characteristics	Multilane Highway Conditions	Freeway Conditions
F	Very low speeds, many vehicles stopped, flow likely to be stop-and-go	Severely congested, gridlock	Severely congested, gridlock

Source: Transportation Research Board, *Highway Capacity Manual* (2000).

For analysis of freeways and multilane highways, LOS reflects the density of vehicles on the facility as well as average travel speeds. Traffic operations on multilane and arterial highways are slightly different than those on freeways because freeway access is controlled and access is allowable only at interchanges, freeways have higher design standards, whereas multi-lane/arterial highways may have traffic signals. Vehicles entering or leaving the road at intersections and driveways will affect traffic flow on multi-lane and arterial highways.

The 2025 peak-hour volumes and levels of service (LOS) on selected highway links throughout the Dulles Corridor are shown in Table 6.2-2 for the No Build Alternative, the Wiehle Avenue Extension, and the full LPA.

Table 6.2-2: Peak-Hour Traffic Volumes and Levels of Service on Selected Highway Links

				Locally Preferred Alternative					
		No Build Alternative (2025)		Wiehle Avenue Extension (2011)		Wiehle Avenue Extension (2025)		Full LPA (2025)	
Highway Link	Location	LOS	Peak-Hour Volume	LOS	Peak-Hour Volume	LOS	Peak-Hour Volume	LOS	Peak-Hour Volume
I-66 Eastbound	Route 29 to Dulles Connector Road	F	6,900	F	5,900	F	6,900	F	6,900
Dulles Connector Road Westbound		F	6,200	F	4,600	F	5,800	F	5,700
I-495 Northbound	Route 7 to Route 123	E	7,800	E	6,900	E	7,700	E	7,700
	HOV lane	D	1,500	D	1,300	D	1,500	D	1,500
Dulles International Airport Access Highway Eastbound	At Route 7	D	4,100	B	2,400	C	3,900	C	3,800
Dulles Toll Road Eastbound	Hunter Mill Road to Reston Parkway	F	7,100	E	6,300	F	7,300	F	7,300
	HOV lane	C	1,200	C	1,200	C	1,200	C	1,200
Route 50*	Fairfax County Parkway and Route 28	F	8,300	D	7,100	F	8,200	F	8,200
Route 28*	Dulles Toll Road and Route 606	D	6,600	C	5,100	D	6,600	D	6,600
Dulles Greenway Eastbound	Route 772 to Route 659	F	8,100	D	6,800	F	8,100	F	8,100

NOTE: HOV – High Occupancy Vehicle lane(s)
*Direction not specified by VDOT.

In 2025, the full LPA would result in similar traffic volumes on regional routes to the No Build Alternative. Most of the routes shown in Table 6.2-3 would only experience slight decreases in traffic for the full LPA. Only the DIAAH would experience a decrease in traffic large enough to result in an improved level of service. Similarly, the Wiehle Avenue Extension is expected to have a negligible impact on regional highway volumes.

Given that the change in traffic volumes for the Wiehle Avenue Extension and the full LPA is small, it is expected that the increase in transit ridership associated with the Wiehle Avenue Extension and the full LPA would have very little effect on vehicle-trip reduction at the regional level. However, implementation of the full LPA would increase overall transportation capacity in the corridor, permitting the movement of more people without requiring for additional highway capacity.

6.2.3.2 Local Traffic Operations

Projected delays at key intersections in the corridor and the corresponding LOS were assessed for 2025, the forecast year for the full LPA and 2011, the opening year for the Wiehle Avenue Extension to determine the anticipated effects of the full LPA on local traffic operations. All intersection delay has been rounded to the nearest whole number. Due to the nature of intersections, travelers are bound to experience some delay at intersections; even during uncongested conditions.

For signalized intersections, the *Highway Capacity Manual* (2000) defines delay thresholds associated with each LOS. Intersection delay includes dwell (stop) time as well as the time associated with acceleration and deceleration at the signal. This measure is intended to reflect driver frustration, fuel consumption, and increased travel time. The delay time represented by each LOS and a qualitative assessment of conditions under each LOS is summarized in Table 6.2-3.

Table 6.2-3: Signalized Intersection Level of Service Characteristics

Level of Service	Intersection Conditions	Average Delay (seconds/vehicle)
A	Uncongested or no delay (Few vehicles stop)	0 – 10
B	Reasonably unimpeded flow (Some vehicles stop)	10 – 20
C	Moderately congested (Significant number of vehicles stop, possible that a few vehicles sit through cycle more than once)	20 – 35
D	Congested (Many vehicles stop, a noticeable number of vehicles sit through cycle more than once)	35 – 55
E	Very congested (Nearly all vehicles will stop, vehicles frequently have to sit through cycle more than once)	55 – 80
F	Severely congested (Gridlock)	> 80

Source: Transportation Research Board, Highway Capacity Manual (2000).

It is important to emphasize that LOS for signalized intersections represents average delay per vehicle. While individual vehicles may experience delays greater than the maximum indicated above for a given LOS, on average, the delay falls within these ranges.

Given the large number of key intersections in the Dulles Corridor, the results of the local traffic analysis are presented below by geographic corridor section. The intersections included in the traffic analyses were selected based on their proximity to the proposed Metrorail stations, and would have the potential to experience the greatest impacts, if any, from the project.

Intersections operating at LOS D or better were considered to perform at an acceptable level of service, which is consistent with Fairfax County and VDOT guidelines for signalized intersections. Intersections that performed at LOS E or LOS F under the Wiehle Avenue Extension and the full LPA were determined to warrant mitigation if the delay time for the intersection was more than the delay experienced under the No Build condition by the greater of either five (5) seconds (or more) or five (5) percent greater than the No Build Alternative delay. In other words, delay at an LOS E or F intersection has to increase at least five (5) seconds to warrant mitigation; however, mitigation might not be required at an intersection with a delay increase of 15 or 20 seconds if that intersection experiences high levels of delay in the No Build condition. For example, if intersection delay increased from 385 seconds to 400 seconds, no mitigation was recommended because this 15-second increase is not greater than 5 percent of the No Build Alternative delay.

A. West Falls Church Station

The West Falls Church Metrorail Station is an existing Orange Line station located in the median of I-66, between the I-66/Route 7 and I-66/Dulles Connector Road interchanges. Private vehicle access to the West Falls Church Station is provided at an entrance just off Haycock Road. This station can also be accessed by the I-66 eastbound ramp. Route 7 is a principal arterial that provides access to Haycock Road from the west, while Great Falls Road is a minor arterial connecting to Haycock Road from the east. Intersections of these roadways were selected for the traffic impact analysis in this station area. In addition, the park-and-ride structure currently under development at West Falls Church Station was considered in the analysis as part of the No Build Alternative.

Table 6.2-4 presents the projected LOS and delay for key intersections in the vicinity of the West Falls Church Metrorail Station.

Table 6.2-4: West Falls Church Station Peak Hour Intersection LOS and Delay in Seconds

			Locally Preferred Alternative					
	No Build Alternative (2025)		Wiehle Avenue Extension (2011)		Wiehle Avenue Extension (2025)		Full LPA (2025)	
Primary Ro-adway/Cross Street	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay
Route 7/ Haycock Road	C/33	D/35	C/25	D/35	D/30	D/37	C/34	D/36
Haycock Road/ West Falls Church Station Parking Entrance	A/6	A/6	A/6	A/7	A/7	A/6	A/7	A/7
Great Falls Street/Haycock Road	E/62	F/98	E/57	F/88	E/60	F/94	E/57	F/91

NOTE: Underlined items meet the threshold at which mitigation should be considered.

The data in Table 6.2-4 show that the construction of either the Wiehle Avenue Extension or the full LPA would have almost no impact on level of service or delay at intersections around the West Falls Church Metrorail station. This minimal impact is based on the fact that no additional parking capacity will be available at the station after implementation of rail in the Dulles Corridor and therefore changes in traffic volumes resulting from implementation, and which would impact LOS and delay, would be marginal.

B. Tysons East Station

The Tysons East Station is the easternmost station for the Wiehle Avenue Extension and the full LPA. The Tysons East Station platform would be located on the north side of Route 123, east of Old Springhouse Road/Scott's Crossing. Off-street Kiss & Ride parking and curbside feeder bus facilities would be located on the south side of Route 123 along Colshire Drive, with additional curbside bus facilities located on the north side of Route 123. A pedestrian bridge spanning Route 123 would connect the south station facilities with the station platform.

Table 6.2-5 presents the projected LOS and delay for key intersections in the vicinity of the Tysons East Station.

Table 6.2-5: Tysons East Station Peak Hour Intersection LOS and Delay in Seconds

			Locally Preferred Alternative					
	No Build Alternative (2025)		Wiehle Avenue Extension (2011)		Wiehle Avenue Extension (2025)		Full LPA (2025)	
Primary Roadway/Cross Street	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay
Route 123/ Old Meadow Road	F/139	F/88	n.a.	n.a.	F/154	E/77	F/154	E/77
Colshire Drive/ Station Entrance	n.a.	n.a.	n.a.	n.a.	B/10	B/12	B/10	B/12
Route 123/ Anderson Road	D/41	C/33	n.a.	n.a.	D/47	D/36	D/47	D/36

NOTE: n.a. = not applicable – opening year analysis not conducted for station because minimal auto related facilities are planned

Underlined items meet the threshold at which mitigation should be considered.

The data in Table 6.2-5 show that traffic conditions will substantially deteriorate at two of the intersections analyzed at the Tysons East Station, under both the Wiehle Avenue Extension and the full LPA; Route 123, Old Meadow Road, Route 123 and Colshire Drive. A description of the mitigation measures proposed to address these impacts at these two intersections is outlined in Section 6.2.4.

C. Tysons Central 123 Station

The Tysons Central 123 Station would be located just west of Tysons Boulevard on the north side of Route 123. This station would have an aerial platform spanning Tysons Boulevard, and would have a pedestrian bridge over Route 123 to provide access to the Tysons Corner Center Mall (Tysons I). No park-and-ride or Kiss & Ride facilities would be provided at this station.

Table 6.2-6 presents the projected LOS and delay for key intersections in the vicinity of the Tysons Central 123 Station.

Table 6.2-6: Tysons Central 123 Station Peak Hour Intersection LOS and Delay in Seconds

	No Build Alternative (2025)		Locally Preferred Alternative					
			Wiehle Avenue Extension (2011)		Wiehle Avenue Extension (2025)		Full LPA (2025)	
Primary Roadway/Cross Street	**a.m. LOS/ Delay**	**p.m. LOS/ Delay**	**a.m. LOS/ Delay**	**p.m. LOS/ Delay**	**a.m. LOS/ Delay**	**p.m. LOS/ Delay**	**a.m. LOS/ Delay**	**p.m. LOS/ Delay**

Tysons Boulevard/ Galleria Drive	C/33	F/87	n.a.	n.a.	C/34	F/82	C/34	F/82
International Drive/ Fletcher Street	D/40	B/20	n.a.	n.a.	D/41	C/20	D/41	C/20
International Drive/ Route 7 SB Local Road	C/33	C/32	n.a.	n.a.	C/33	C/31	C/33	C/31
International Drive/ Route 7 NB Local Road	E/60	E/56	n.a.	n.a.	E/59	D/55	E/59	D/55

NOTES: n.a. = not applicable – opening year analysis not conducted for station because minimal auto related facilities are planned

Underlined items meet the threshold at which mitigation should be considered.

The data in Table 6.2-6 show that there would be almost no change in the Level of Service or delay at the analyzed intersections after implementation of either the Wiehle Avenue Extension or the full LPA. This marginal change in intersection operations is based on the fact that the primary mode of access this station is not by automobile, thus no parking or Kiss & Ride facilities will be developed at the station, and volumes on roadways around the station will remain generally consistent with the No Build Alternative.

D. Tysons Central 7 Station

The Tysons Central 7 Station would be located underground on the south side of Route 7; north of the Route 7/123 interchange, between Tysons Square Center and Pike 7 Plaza. Entrance pavilions would be provided on both sides of Route 7 and would be connected by a pedestrian bridge that spans the roadway. Park-and-ride and Kiss & Ride facilities would not be provided, and feeder and/or circulator bus service is not planned to serve this station. Table 6.2-7 presents the projected LOS and delay for key intersections in the vicinity of the Tysons Central 7 Station.

Table 6.2-7: Tysons Central 7 Station Peak Hour Intersection LOS and Delay in Seconds

Primary Roadway/Cross Street	No Build Alternative (2025)		Locally Preferred Alternative					
			Wiehle Avenue Extension (2011)		Wiehle Avenue Extension (2025)		Full LPA (2025)	
	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay
Route 7 SB Ramp/ Local Road/ Route 123 EB Ramp/ Local Road	B/13	B/14	n.a.	n.a.	B/13	B/14	B/13	B/14
Route 7 NB Ramp/ Local Road/ Route 123 EB Ramp/Local Road	B/17	B/18	n.a.	n.a.	B/17	B/17	B/17	B/17
Route 7 SB Ramp/ Local Road/ Route 123 WB Ramp/Local Road	C/23	B/21	n.a.	n.a.	C/22	B/20	C/22	B/20
Route 7 NB Ramp/ Local Road/ Route 123 WB Ramp/Local Road	C/22	C/22	n.a.	n.a.	C/21	C/21	C/21	C/21
Route 7 SB Local Road/ West Park Drive	E/71	D/42	n.a.	n.a.	E/57	D/36	E/57	D/36
Route 7 NB Local Road/ West Park Drive	E/62	D/38	n.a.	n.a.	D/48	C/32	D/48	C/32

NOTE: n.a. = not applicable – opening year analysis not conducted for station because minimal auto related facilities are planned.
Underlined items meet the threshold at which mitigation should be considered.

The data in Table 6.2-7 show that there would be almost no change in LOS or delay at the analyzed intersections after implementation of either the Wiehle Avenue Extension or the full LPA. As with the Tysons Central 123 Station, this minimal change is based on the fact that no parking or Kiss & Ride facilities will be developed at the station.

E. Tysons West Station

The Tysons West Station will be located above ground on the west side of Route 7 between Tyco and Spring Hill Roads. Entrance pavilions would be provided on both sides of Route 7, with the east side of Route 7 connected to the station via a pedestrian bridge. A Kiss & Ride and bus bays would located on the east side of Route 7, between Tyco Road and Spring Hill Road. Access to the bus facility will be via Tyco Road.

Table 6.2-8 presents the projected LOS and delay for key intersections in the vicinity of the Tysons West Station.

Table 6.2-8: Tysons West Station Peak Hour Intersection LOS and Delay in Seconds

Primary Roadway/Cross Street	No Build Alternative (2025)		Locally Preferred Alternative					
			Wiehle Avenue Extension (2011)		Wiehle Avenue Extension (2025)		Full LPA (2025)	
	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay
Route 7/Dulles Toll Road EB Ramp	A/5	A/4	A/7	A/5	A/7	A/5	A/7	A/5
Route 7/ Dulles Toll Road WB Ramp	C/25	C/25	D/41	C/28	D/41	C/28	D/41	C/28
Route 7/Tyco Road	F/230	F/385	F/185	F/195	F/186	F/192	F/190	F/202

Primary Roadway/Cross Street	No Build Alternative (2025)		Locally Preferred Alternative					
			Wiehle Avenue Extension (2011)		Wiehle Avenue Extension (2025)		Full LPA (2025)	
	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay
Tyco Road/Station Entrance	n.a.	n.a.	A/7	A/6	A/7	A/6	A/7	A/6
Route 7/Spring Hill Road	F/314	F/467	E/77	E/146	E/84	F/135	E/84	F/135

Underlined items meet the threshold at which mitigation should be considered.

The data in Table 6.2-8 show that traffic conditions will remain the same or actually improve after implementation of either the Wiehle Avenue Extension or the full LPA. Level of Service will deteriorate marginally at the intersection of Route 7 and the westbound ramp to the toll road, but the marginal impacts do not warrant additional mitigation, especially given the very poor intersection operations conditions at adjoining intersections.

F. Wiehle Avenue Station

The Wiehle Avenue station in both the Wiehle Avenue Extension and the full LPA would be located in the median of the DIAAH, just west of the Wiehle Avenue overpass. Pedestrian bridges spanning the DIAHH would connect the north and south side station facilities with the station platform. A large park and ride facility would be located on the north side of the station. Also located on the north side will be a large bus facility and Kiss & Ride facilities. For Wiehle Avenue Extension, Wiehle Avenue will be the terminal station for rail and thus will be handling very large volumes of bus traffic coming from locations to the west of the station. This will require a bus intermodal facility on the north side of the station as well as a bus facility located adjacent to the eastbound exit ramp from the Dulles Toll Road to Wiehle Avenue. The north side bus facility will have a dedicated bus access lane from Wiehle Avenue to separate buses from general traffic. The north side bus facility will also have direct access to the westbound entrance ramp to the Dulles Toll Road. The LOS and delay figures outlined below in Table 6.2-9 reflect the Wiehle Avenue Extension bus operations.

Table 6.2-9: Wiehle Avenue Station Peak Hour Intersection LOS and Delay in Seconds

Primary Roadway/Cross Street	No Build Alternative (2025)		Locally Preferred Alternative					
			Wiehle Avenue Extension (2011)		Wiehle Avenue Extension (2025)		Full LPA (2025)	
	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay
Wiehle Avenue/Dulles Toll Road WB Ramp	C/25	C/22	C/23	C/22	D/39	C/32	D/45	C/25
Wiehle Avenue/ Dulles Toll Road EB Ramp	C/25	C/21	C/24	C/21	D/37	C/25	D/35	C/22
Wiehle Avenue/Station Entrance	C/21	D/50	D/43	E/59	D/47	E/58	D/36	E/80
Wiehle Avenue/Sunset Hills Road	E/62	F/148	E/68	F/144	E/67	F/152	E/79	F/153
Wiehle Avenue/Sunrise Valley Drive	E/75	D/50	F//104	E/62	F/86	E/66	F/85	E/64

NOTES: Underlined items meet the threshold at which mitigation should be considered.

Park-and-ride, Kiss & Ride, and express bus (for the Wiehle Avenue Extension only) demand at Wiehle would lead to increased traffic volumes, increased delay, and declining Levels of Service at intersections in the vicinity of the station in both the Wiehle Avenue Extension and the full LPA. For the Wiehle Avenue/Sunset Hills Road, the Wiehle Avenue/Sunrise Valley Drive, and station entrance, the impacts would be significant enough to warrant mitigation. Proposed mitigation strategies for Wiehle Avenue are included in Section 6.2.4.

G. Reston Parkway

The Reston Parkway station would be located in the median of the DIAAH, just west of the Reston Parkway overpass. Pedestrian bridges spanning the DIAAH would connect the north and south side station facilities with the station platform. Kiss & Ride and bus access would be provided on both sides of the DIAAH and Dulles Toll Road. On the north side, facilities would be located along eastbound Sunset Hills Road, east of Town Center Parkway. Access to the south side facility would be provided at the north end of Edmund Halley Drive. Table 6.2-10 presents the projected LOS and delay for key intersections in the vicinity of the Reston Parkway Station.

Table 6.2-10: Reston Parkway Avenue Station Peak Hour Intersection LOS and Delay in Seconds

			Locally Preferred Alternative					
	No Build Alternative (2025)		Wiehle Avenue Extension (2011)		Wiehle Avenue Extension (2025)		Full LPA (2025)	
Primary Roadway/Cross Street	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay
Reston Parkway/Dulles Toll Road WB Ramp	F/119	F/117	n.a.	n.a.	n.a.	n.a.	F/106	F/119
Reston Parkway/Dulles Toll Road EB Ramp	F/100	C/22	n.a.	n.a.	n.a.	n.a.	F/102	D/36
Reston Parkway/Sunset Hills Road	E/78	F/98	n.a.	n.a.	n.a.	n.a.	F/82	F/100
Reston Parkway/Sunrise Valley Drive	F/216	F/207	n.a.	n.a.	n.a.	n.a.	F/218	F/209
Reston Parkway/Town Center Parkway	C/24	F/98	n.a.	n.a.	n.a.	n.a.	C/26	F/99
Sunset Hills Road/Future North Station Entrance	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.	B/16	A/6
Edmund Haley Drive/Future South Station Entrance	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.	B/11	B/11

NOTES: n.a. = not applicable – station exists only in full LPA

Underlined items meet the threshold at which mitigation should be considered.

The majority of the intersections in the vicinity of the Reston Parkway Station that were analyzed for traffic impacts will be failing in the 2025 No Build Alternative, and the implementation of the full LPA will have minimal additional impact on all but two of these intersections. The two intersections where a deterioration in LOS and increased delay will occur after implementation of the full LPA are at the intersections of Reston Parkway and the Dulles Toll Road eastbound and westbound exit ramps. Proposed mitigation strategies for are discussed in 6.2.4.

H. Herndon-Monroe Station

The Herndon-Monroe station would be located at the site of the present Herndon-Monroe park-and-ride lot, off of Sunrise Valley Drive and just east of the Van Buren/Monroe Street overpass. The station would

be located in the median of the DIAAH, with entrance pavilions provided on both sides of the roadway. These would be connected to the station by pedestrian bridges over the Dulles Toll Road and the DIAAH. On the north side of the Dulles Toll Road, a sidewalk would be constructed to provide direct access to the north side entrance pavilion from Herndon Parkway. On-street bus bays are planned for this location but no Kiss & Ride facilities are planned. Table 6.2-11 presents the projected LOS and delay for key intersections in the vicinity of the Herndon-Monroe Station.

Table 6.2-11: Herndon-Monroe Station Peak Hour Intersection LOS and Delay in Seconds

			Locally Preferred Alternative					
	No Build Alternative (2025)		Wiehle Avenue Extension (2011)		Wiehle Avenue Extension (2025)		Full LPA (2025)	
Primary Roadway/Cross Street	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay
Fairfax County Parkway/Dulles Toll Road WB Ramp	C/31	D/46	n.a.	n.a.	n.a.	n.a.	C/34	E/67
Fairfax County Parkway/Dulles Toll Road EB Ramp	D/39	E/59	n.a.	n.a.	n.a.	n.a.	D/39	E/70

Sunrise Valley Drive/Monroe Street	E/74	D/44	n.a.	n.a.	n.a.	n.a.	F/107	E/76
Sunrise Valley Drive/Roark Drive (H-M park-and-ride Entrance)	B/11	B/10	n.a.	n.a.	n.a.	n.a.	D/43	C/28
Worldgate Drive/Van Buren Street	B/15	C/22	n.a.	n.a.	n.a.	n.a.	B/18	C/26

NOTES: n.a. = not applicable – station exists only in full LPA

Underlined items meet the threshold at which mitigation should be considered.

Park-and-ride and Kiss & Ride demand at Herndon-Monroe will lead to increased traffic volumes, increased delay, and declining Levels of Service at a number of intersections in the vicinity of the station in the full LPA. Impacts at the following intersections would be significant enough to warrant mitigation:

- Fairfax County Parkway/Dulles Toll Road Westbound Ramp;
- Fairfax County Parkway/Dulles Toll Road Eastbound Ramp;
- Fairfax County Parkway/Sunrise Valley Drive;
- Herndon Parkway/Monroe Street/Van Buren Street; and
- Sunrise Valley Drive/Monroe Street.

Proposed mitigation strategies for these intersections are discussed in section 6.2.4.

I. Route 28 Station

The Route 28 Station would be located in the median of the DIAAH, midway between Centreville Road/Elden Street and Route 28. Station entrance pavilions would be located on the north and south sides of the DIAAH, with a pedestrian bridge connecting each to the station platform. On the north side, a small Kiss & Ride and bus transfer facility would be built to provide access to the station from Herndon

and Sterling. On the south side, a park-and-ride, and bus transfer facility would be constructed. Table 6.2-12 presents the projected LOS and delay for key intersections in the vicinity of the Route 28 Station.

Table 6.2-12: Route 28 Station Peak Hour Intersection LOS and Delay in Seconds

			Locally Preferred Alternative					
	No Build Alternative (2025)		Wiehle Avenue Extension (2011)		Wiehle Avenue Extension (2025)		Full LPA (2025)	
Primary Roadway/Cross Street	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay

Centreville Road/Sunrise Valley Drive	D/54	E/79	n.a.	n.a.	n.a.	n.a.	D/53	E/56
Sunrise Valley Drive/South Station Entrance	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.	B/15	C/21
Herndon Parkway/Centreville Road	F/99	F/110	n.a.	n.a.	n.a.	n.a.	F/107	F/197

NOTES: n.a. = not applicable – station exists only in full LPA

Underlined items meet the threshold at which mitigation should be considered.

Park-and-ride and Kiss & Ride demand at Route 28 will lead to increased traffic volumes, increased delay, and declining Levels of Service at a number of intersections in the vicinity of the station in the full LPA. Impacts at the following intersections would be significant enough to warrant mitigation with the implementation of the full LPA.

- Centreville Road/Dulles Toll Road – Westbound Ramp;
- Centreville Road/Dulles Toll Road – Eastbound Ramp; and
- Herndon Parkway/Centreville Road.

Proposed mitigation strategies for these intersections are discussed in section 6.2.4.

J. Dulles Airport Station

A formal traffic analysis for the full LPA was not performed for the Dulles Airport station area because the proposed station at the airport would not have any project-related park-and-ride or Kiss & Ride activity.

K. Route 606 Station

The Route 606 Station will be located in the median of the Dulles Greenway, just to the west of the Route 606 overpass. A pedestrian bridge spanning the westbound lanes of the Dulles Greenway would connect the median mezzanine with feeder bus facilities Kiss & Ride, and park-and-ride facilities and parking. Table 6.2-13 presents the projected LOS and delay for key intersections in the vicinity of the Route 606 Station.

Table 6.2-13: Route 606 Station Peak Hour Intersection LOS and Delay in Seconds

Primary Roadway/Cross Street	No Build Alternative (2025)		Locally Preferred Alternative					
			Wiehle Avenue Extension (2011)		Wiehle Avenue Extension (2025)		Full LPA (2025)	
	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay
Route 606/Route 789	C/21	C/24	n.a.	n.a.	n.a.	n.a.	E/56	F/89
Route 789/North Station Entrance	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.	B/19	B/12
South Station Entrance	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.	B/11	B/17

NOTES: n.a. = not applicable – station exists only in full LPA

Underlined items meet the threshold at which mitigation should be considered.

Traffic operations at one intersection in the vicinity of the Route 606 Station will deteriorate under the full LPA. Proposed mitigation strategies for this intersection are discussed in section 6.2.4.

L. Route 772 Station

The Route 772 Station will be located in the median of the Dulles Greenway, east of the Route 772 overpass. Pedestrian bridges spanning the Dulles Greenway would connect the median platform with feeder bus, Kiss & Ride and park-and-ride facilities. Table 6.2-14 presents the projected LOS and delay for key intersections in the vicinity of the Route 772 Station.

Table 6.2-14: Route 772 Station Peak Hour Intersection LOS and Delay in Seconds

Primary Roadway/Cross Street	No Build Alternative (2025)		Locally Preferred Alternative					
			Wiehle Avenue Extension (2011)		Wiehle Avenue Extension (2025)		Full LPA (2025)	
	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay	a.m. LOS/ Delay	p.m. LOS/ Delay
North Side Facility: Station Access Road/Station Entrance	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.	A/5	A/8
South Side Facility: Station Access Road/Station Entrance	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.	C/24	B/15

NOTES: n.a. = not applicable – station exists only in full LPA

Underlined items meet the threshold at which mitigation should be considered.

Intersections in the vicinity of the station will operate at acceptable levels of service and therefore no mitigation is required.

6.2.4 MITIGATION

6.2.4.1 Station Access

To ensure adequate vehicular access to station areas, the following roadway improvements specified in the General Plans would be constructed under the Wiehle Avenue Extension and the full LPA.

A. Wiehle Avenue Extension

At the Tysons Central 123 station, a dedicated right turn lane for buses on Tysons Boulevard and acceleration lane on Route 123 would be added.

At the Wiehle Avenue station, a new left turn lane northbound on Wiehle Avenue, a new left turn lane to eastbound Dulles Toll Road exit ramp at Wiehle Avenue, and a new acceleration lane for bus egress from station facilities onto the westbound Dulles Toll Road would be added. Westbound Sunset Hills Road between Wiehle Avenue and Isaac Newton Square would be widened and a left turn lane would be provided. The private roadway south of Sunset Hills Road would be improved to VDOT standards.

B. Full LPA

In addition to the access improvements constructed as part of the Wiehle Avenue Extension, the full LPA would include additional left turn lanes to northbound Route 789 at both north and south station entrances at the Route 606 station. A right turn lane and left turn lanes on Route 606 for vehicular access to yard facilities would be added at S&I Yard Site 15.

6.2.4.2 Station Vicinity

To mitigate long-term effects on traffic in the vicinity of proposed Metrorail stations, these additional roadway improvements would be constructed before the opening of the Wiehle Avenue Extension and the full LPA.

A. Wiehle Avenue Extension

A second left turn lane from Old Meadow Drive to southbound Route 123 would be added at Tysons East. At Wiehle Avenue, the right turn lane (dual or free-flow) from eastbound Sunset Hills Road to southbound Wiehle Avenue, and the right turn lane (dual or free-flow) from westbound Sunrise Valley Drive to northbound Wiehle Avenue, would be improved.

B. Full LPA

For the Reston Parkway station, an additional northbound through lane on Reston Parkway at Sunrise Valley Drive intersection would be constructed, and the right turn lane (dual or free-flow) from southbound Reston Parkway to westbound Sunrise Valley Drive would be improved.

At the Herndon-Monroe station, a left turn lane from southbound Monroe Street to eastbound Sunrise Valley Drive would be added; and the right turn lane (dual or free-flow) from eastbound Sunrise Valley Drive to southbound Fairfax County Parkway would be improved. The lane configurations at the Van Buren (Monroe) Street and Herndon Parkway intersection would be modified.

An additional right turn lane from southbound Route 789 to westbound Route 606 would be constructed at the Route 606 station.

Additional intersection improvements in the vicinity of stations would be needed by 2025, as presented in the Traffic Analysis Technical Report.

6.2.4.3 Construction Activities

To mitigate the effects of construction related traffic management and detours, DRPT would prepare maintenance of traffic plans. In addition, DRPT will make all efforts to maintain access (pedestrian and vehicular) to existing businesses during construction. Existing access points would be used to the extent possible. If alternative access is required, signage and detours will be provided. DRPT would maintain communication with affected businesses and residents in order to minimize construction effects. The

development of mitigation measures for construction activities would be coordinated with VDOT for Commonwealth-owned roadways and MWAA for the Dulles Airport property, including the DIAAH.

6.3 EFFECTS ON OTHER TRANSPORTATION FACILITIES AND SERVICES

Other transportation facilities and services in the corridor include parking, bicycle and pedestrian facilities, and air transportation service. This section provides a brief description of these transportation facilities and services in the Dulles Corridor, and also documents the potential effects of the Wiehle Avenue Extension and the full LPA on these services and facilities. Section 6.3.1 describes the existing and planned parking, bicycle and pedestrian facilities, and air transportation facilities in the corridor. Section 6.3.2 presents the anticipated long-term effects associated with the No Build Alternative, the Wiehle Avenue Extension and the full LPA. Section 6.3.3 provides an overview of the expected effects on other transportation facilities and services during construction of the Wiehle Avenue Extension and the full LPA, and Section 6.3.4 presents proposed mitigation measures for any anticipated adverse effects.

6.3.1 EXISTING AND PLANNED FACILITIES AND SERVICES

6.3.1.1 Parking

Several public park-and-ride facilities are located within the Dulles Corridor. Table 6.3-1 identifies each of the public parking facilities designed to facilitate use of public transportation and/or ridesharing in the corridor.

Table 6.3-1: Park-and-Ride Facilities in the Dulles Corridor

	Park-and-Ride Facilities	Owner/ Operator	Daily Cost	Number of Spaces	Usage Rate (2000)	Connecting Services
1	East Falls Church Metrorail Station	WMATA	$3.75	385	100.0%	Metrobus
2	West Falls Church Metrorail Station	WMATA	$3.75	1,037	100.0%	Metrobus, Fairfax Connector, Washington Flyer
3	West Falls Church Metrorail Station (overflow parking)	Virginia Tech/ University of Virginia	$3.75	275	100.0%	Metrobus, Fairfax Connector, Washington Flyer
4	Reston East (Wiehle Avenue)	Fairfax County	Free	827 (2,300)*	100.0%	Fairfax Connector, RIBS
5	Reston North (Overflow parking for Reston East)	VDOT	Free	320	28.4%	Fairfax Connector, RIBS
6	Reston South	Fairfax County	Free	400	42.3%	Fairfax Connector, RIBS
7	Herndon-Monroe	Fairfax County	Free	1,745	47.2%	Fairfax Connector, RIBS
8	Dulles North	Loudoun County	Free	750	31.6%**	Loudoun County Community Bus Service
Total Capacity				**5,739** **(7,212)***		

NOTES: See Figure 6.1-1 for locations
* Planned total number of spaces by 2010. ** For Year 2002
Source: WMATA, Fairfax County, VDOT, and CTC.

Except for the two overflow facilities, each of the park-and-ride lots also provides Kiss & Ride areas. In the No Build Alternative, it is assumed that the Reston East Park-and-Ride at Wiehle Avenue will expand from 827 spaces to a total of 2,300 spaces by 2010, resulting in a baseline parking capacity of 7,212 spaces through 2025. A park-and-ride structure at West Falls Church Station is also being constructed by Fairfax County and WMATA. No other changes to the existing park-and-ride lots in the corridor are anticipated.

Non-transit-related parking systems in the Dulles Corridor are typical of other suburban environments. Off-street parking is provided at most major office complexes and retail facilities within the corridor. Surface parking is most typical. Structured parking is increasing, particularly in Tysons Corner. Reston Town Center also contains large multi-level parking garages. Parking is generally free at office and retail developments within the corridor. However, some businesses in Tysons Corner are beginning to charge employees for parking as the value of these spaces increases. It is expected that the amount of paid parking in Tysons Corner will continue to increase. Dulles Airport recently added 8,500 parking spaces as part of its six-year expansion plans.

6.3.1.2 Bicycle and Pedestrian Facilities

The pedestrian environment varies within the corridor. Most roads in Tysons Corner have sidewalks, although the character of existing development and topography discourage walking. Residential areas in Reston are typically served by a system of trails linking neighborhood clusters. Commercial areas are generally equipped with adequate pedestrian facilities to support internal circulation, although pedestrian linkages between developments are usually poor. Eastern Loudoun County is less developed, and there are currently no pedestrian facilities within proposed station areas. A detailed inventory of pedestrian facilities in the corridor is provided in the *Traffic Analysis and Station Access Study* (August 2004).

The Dulles Corridor includes approximately 25 miles of the 45-mile Washington & Old Dominion Railroad Regional Park (commonly known as the W&OD Trail). The park consists of a 100-foot wide right-of-way reserved for recreational use, and extends from just west of Interstate 395 in south Arlington to Purcellville in central Loudoun County. Within the corridor, the W&OD Trail runs along I-66 adjacent to the East Falls Church Metrorail Station and continues west through Falls Church, Vienna, and Reston. The trail crosses the DIAAH and Dulles Toll Road just east of Wiehle Avenue and runs parallel to Sunset Hills Road through the Reston Town Center area. The trail continues northwest through Herndon, Sterling, and Ashburn.

No new major pedestrian facilities are planned in the corridor through 2025.

6.3.1.3 Air Transportation

Dulles Airport is located in eastern Loudoun County and western Fairfax County, just west of Route 28 and south of the Dulles Greenway. Ground access to Dulles Airport is currently provided primarily via the DIAAH and Route 28. According to MWCOG's Washington-Baltimore Regional Air Passenger Survey (1998), access by private vehicle to Dulles Airport has been declining as a share of total passenger access to the airport for flight originations, but the total overall number of vehicle trips to the airport has increased. In addition, the use of taxis and airport shuttles and buses, provided through the privately contracted Washington Flyer service, has increased dramatically. Table 6.3-2 provides information on mode of access to Dulles Airport and to all three of the region's major airports (Dulles Airport, National Airport, and Baltimore-Washington International Airport (BWI) in Maryland) for the years 1987 and 1998.

Table 6.3-2: Mode of Access, Dulles Airport and All Major Airports in Region, 1987 to 1998 (thousands of originations)

Mode of Access	Dulles Airport				All Major Airports in Region			
	1987	%	1998	%	1987	%	1998	%
Private Car	2,127	61	2,549	47	6,127	47	8,081	44
Rental Car	616	18	839	15	1,747	14	2,734	15
Taxi	368	11	875	16	2,905	22	3,535	19
Metrorail (National Airport)	0	0	0	0	1,025	8	801	4
LRT/Commuter Rail (BWI)	0	0	0	0	10	0	138	1
Airport Bus/Limo	170	5	618	11	456	4	1,892	10

Other	129	4	39	1	277	2	95	1
TOTAL	**3,467**	**100**	**5,444**	**100**	**12,924**	**100**	**18,526**	**100**

Source: MWCOG Survey (2001)
NOTE: Percentages may not sum to 100% due to rounding.

Dulles Airport is the region's largest air passenger facility, and one of the largest and fastest growing airports in the world. Dulles Airport served 20.1 million passengers (an average of 55,000 a day) on nearly 454,000 commercial, general aviation, and commuter flights in 2000. Passenger traffic has increased 56 percent since 1996. In addition, Dulles Airport is currently undergoing a six-year, $3.4 billion program of improvements to increase air and landside capacity (including the construction of 8,500 new parking spaces). MWAA plans to add a third lane in both directions of the DIAAH sometime before 2010. It is anticipated that air passenger service will eventually reach 55 million annually when all planned facilities are built by 2035. Employment at the airport is expected to reach 60,000 that same year.

6.3.2 LONG-TERM EFFECTS

6.3.2.1 Parking

Parking for each rail station was designed and sized based on projected demand for spaces, site constraints, cost, local land use plans, as well as consultations with local governments. As identified earlier, Fairfax County plans to expand the Reston East Park-and-Ride facility to 2,300 spaces by 2010. Implementation of the Dulles Corridor Rapid Transit Project would accelerate the expansion of this facility as part of the construction Wiehle Avenue Station. In addition to this expansion, the project would add between 1,500 and 9,550 other new parking spaces in the corridor by 2025. Table 6.3-3 summarizes the planned parking expansion program of the Dulles Corridor Rapid Transit Project.

Table 6.3-3: Existing and Planned Parking Capacity for the Dulles Corridor Rapid Transit Project

Park-and-Ride Stations	No Build Alternative (2025)	Locally Preferred Alternative		
		Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Tysons West	0	500	500	500
Wiehle Avenue	2,300	2,300	2,300	2,300
Herndon-Monroe	1,750	1,750	2,450	3,500
Route 28	0	0	0	2,000
Route 606	750	750	750	2,750
Route 772	0	300	300	3,300
TOTAL	**4,800**	**5,600**	**6,300**	**14,350**

Parking totals for the full LPA in the table above reflect maximum planned capacities for the full LPA. The parking capacities for Route 606 assume the capacity at the Dulles North Transit Center, in addition to any parking built for the Dulles Corridor Rapid Transit Project. The Dulles North Transit Center would continue to operate through 2025 as an overflow parking facility.

For the Wiehle Avenue Extension and the full LPA, parking fees would be charged at corridor parking facilities. Parking costs at stations and stops throughout the corridor are assumed to be $3.75 per day (the current charge levied at Fairfax County Metrorail park-and-rides), and increase every three years at the 3-year average of the Consumer Price Index.

For the Wiehle Avenue Extension, parking levels would be far less than those for the full LPA. East of and including Wiehle Avenue Station, the park-and-ride capacity provided by the Wiehle Avenue Extension would be the same as that provided by the full LPA, but west of Wiehle Avenue Station substantially less capacity would be provided. Overall, the Wiehle Avenue Extension would provide 39 percent of the parking capacity for the full LPA. If the full LPA is not implemented in its entirety, park-and-ride capacity would be increased at Herndon-Monroe to 2,450 spaces to meet the increased demand for transit services in the corridor. By 2025, capacity would be approximately 44 percent of the capacity for the full LPA.

6.3.2.2 Bicycle and Pedestrian Facilities

The Dulles Corridor Rapid Transit Project is not expected to have a significant impact on existing and planned bicycle and pedestrian facilities in the corridor. Implementation of the Wiehle Avenue Extension or the full LPA would include the construction of pedestrian and vehicular access to/from public rights of way. Bicycle racks and lockers would be provided at all stations and express bus stops, adjacent to station/stop entrances. All other pedestrian and bicycle trails would fall under the jurisdiction of the local governments. All pedestrian facilities built for the Dulles Corridor Rapid Transit Project would be compliant with requirements of the Americans with Disabilities Act of 1991.

The full LPA would not affect the alignment and operation of the W&OD Trail. However, it would result in the provision of greater regional transit access to the western portion of the trail. The Metrorail system has a liberal “Bike-on-Rail” policy, which allows passengers, during designated hours, to bring bicycles on to the system. Both the Wiehle Avenue and Reston Parkway stations are located adjacent to the W&OD Trail, and, therefore, would serve as convenient bike/transit transfer points for passengers choosing to split their trip between bicycles and rail.

6.3.2.3 Air Transportation

The Dulles Corridor Rapid Transit Project would have no impact on air transportation at Dulles Airport. However, the project would provide improved transit access to and from Dulles Airport for most of the metropolitan area. Specifically, the full LPA will provide seamless transit access to and from anywhere on the existing Metrorail system, including downtown Washington, D.C.; regional employment and activity centers such as Reston, Tysons Corner, Ballston, Rosslyn, Crystal City, Pentagon City, Alexandria, Bethesda, Rockville, and Silver Spring; and National Airport. The project would also provide a connection to MARC Commuter Rail services at the Union Station and New Carrollton Metrorail stations. MARC provides a rail link from the Metrorail system to BWI Airport in Maryland.

6.3.3 CONSTRUCTION EFFECTS

No construction effects are anticipated for bicycle and pedestrian facilities or air transportation. Some impacts may occur during the expansion of park-and-ride lots at the different Metrorail stations. These impacts should be minor and of a short duration.

6.3.4 MITIGATION

Plans for operations during construction would be developed for each of the park-and-ride lots to be affected during lot expansion, in coordination with the lot owners, either Fairfax County or VDOT.

This Page Intentionally Left Blank

7 SECTION 4(f) EVALUATION

This chapter discusses the effects of the Dulles Corridor Rapid Transit Project on parklands and historic properties to comply with the provisions of Section 4(f) of the U.S. Department of Transportation Act of 1966 (commonly referred to as Section 4(f)), and Section 6(f) of the Land and Water Conservation Fund Act of 1965 (commonly referred to as Section 6(f)).

The alternative formerly known as "LPA Phase 1" in the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* has been renamed the Wiehle Avenue Extension in this Final EIS and is expected to begin operations in 2011. This change reflects the federal approach to the project's funding under the Federal Transit Administration's New Starts program. It will assure consistency among the environmental, engineering and financial documents during the project's development.

In the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* as well as this Final EIS, the term "full LPA" represents the Wiehle Avenue Extension and the second phase of the Dulles Corridor Rapid Transit Project. This second phase would extend west from Wiehle Avenue to Washington Dulles International Airport and Route 772 and is expected to begin operations in 2015.

The term "LPA", "proposed action", or "selected LPA" refers to both the Wiehle Avenue Extension and the full LPA collectively.

7.1 LEGAL AND REGULATORY CONTEXT

7.1.1 SECTION 4(f) OF THE U.S. DEPARTMENT OF TRANSPORTATION ACT

Section 4(f), as amended, of the U.S. Department of Transportation Act of 1966, (codified at 49 USC § 303) protects public parks and recreational lands, wildlife refuges, and historic sites of national, state, or local significance from acquisition and conversion to transportation use. Federal regulations that implement Section 4(f) may be found at 23 CFR 771.135. Under Section 4(f), the use of such publicly owned lands for transportation purposes can occur only if there is no feasible and prudent alternative to such use, and if the project includes all possible planning to minimize harm to those resources.

7.1.1.1 "Use" under Section 4(f)

Section 4(f) applies to protected resources when a "use" occurs. "Use" can be permanent, temporary adverse, or constructive as defined below.

Permanent use is the incorporation of the resource into the transportation facility; it includes fee simple and permanent easement use.

Temporary adverse use occurs when a transportation project temporarily occupies any portion of the resource, and results in an adverse condition. In order for a temporary use of Section 4(f) land not to be

considered adverse, it must meet certain conditions. First, the duration of the occupancy must be less than the time needed for the construction of the project and there must not be a change in ownership. Second, there are no anticipated permanent adverse physical changes or interference with activities or purposes of the resource, on a temporary or permanent basis. Third, there is a documented agreement of the appropriate federal, state, or local officials having jurisdiction over the resource, regarding the above conditions. Finally, both the nature and magnitude of the changes to Section 4(f) resources are minimal and the land is restored to the same or better condition.

Constructive or indirect use occurs when the resource is not physically occupied but the proximity effects of the transportation project are so great that the activities, features or attributes that qualify the property for Section 4(f) protection are substantially impaired.

7.1.1.2 "Feasible and Prudent" Alternatives under Section 4(f)

The use of Section 4(f) lands for transportation purposes can only be permitted if there is no "feasible and prudent" alternative to such use and the project includes all possible planning to minimize harm to the resources from such use.

7.1.2 Section 6(f) of the Land and Water Conservation Fund Act

Section 6(f) of the Land and Water Conservation Fund Act (L&WCF) of 1965 (16 USC § 4601-4 et seq.) preserves, develops, and assures the quality and quantity of outdoor recreation resources through purchase and improvement of recreational lands, wildlife and waterfowl refuges, and similar resources. Section 6(f) contains provisions to protect and maintain the quality of federal, state, and local investments, such as parkland and/or recreational resources. The Act established a funding source for federal acquisition or park and recreation lands and matching grants to state and local governments for recreation planning, acquisition, and development. Once purchased using these funds, these lands are protected from conversion to land uses other than public outdoor recreational uses.

A conversion of use occurs when land purchased with or improved with L&WCF grants is changed from or developed for any other use than outdoor recreation. Any such conversion must be in accordance with an existing comprehensive statewide outdoor recreation plan and must be approved by the Secretary of the Interior. If a conversion occurs, the land must be replaced with other recreational properties of at least equal fair market value and with reasonably equivalent usefulness and location. Temporary uses for construction, etc., are not considered conversions if the property is restored to its original condition after construction.

7.2 PROPOSED ACTION

The Commonwealth of Virginia, through the Department of Rail and Public Transportation (DRPT) and in cooperation with the Washington Metropolitan Area Transit Authority (WMATA), is proposing to implement a 23-mile rapid transit service in the rapidly growing Dulles Corridor in Fairfax and Loudoun counties, Virginia. In addition to the No Build Alternative, a Locally Preferred Alternative (LPA) is being evaluated to serve portions of Fairfax and Loudoun counties and Dulles Airport. The LPA includes an extension of the regional Metrorail system through Tysons Corner, along the Dulles International Airport Access Highway (DIAAH) to Dulles Airport, and along the Dulles Greenway into eastern Loudoun County (see Figure 7.2-1). The LPA would be implemented in two phases. The Wiehle Avenue Extension would include the construction of the LPA to Wiehle Avenue, with Express Bus Service along the remainder of the project corridor. The Wiehle Avenue Extension would begin operations in 2011. The full LPA would

Locally Preferred Alternative

Dulles Corridor Rapid Transit Project

include the extension of Metrorail to Route 772 in Loudoun County. The full LPA is expected to begin operations in 2015.

The majority of the alignment is within the median of the Dulles Connector Road, DIAAH, and Dulles Greenway. In general, the study area consists of suburban development of medium density. However, the western portion of the study area nearing and within Loudoun County is less developed.

7.3 EXISTING SECTION 4(f)/6(f) RESOURCES

The study area for Section 4(f) and 6(f) resources varied depending upon the type of resource and potential for use during construction or operation of the LPA. For parklands, a 600-foot-wide corridor was established along the Dulles Connector Road, DIAAH and Dulles Toll Road, and Dulles Greenway. At station and other facility locations, the study area was expanded to widths of 800 to 2,000 feet, depending on the type of facility. For historic resources, coordination with the Virginia Department of Historic Resources (VDHR) determined the Area of Potential Effect (APE) to be 600 feet on each side of the alignment and project facilities. The APE for archaeological resources was determined to be 200 feet on each side of the alignment and project facilities.

Section 4(f) and/or Section 6(f) resources identified within the corridor include historic resources, archaeological sites, and publicly owned parks and recreation areas. Historic and archaeological sites must be listed on or eligible for listing on the National Register of Historic Places (NRHP) to qualify as a Section 4(f) resource, irrespective of ownership. Figure 7.3-1a and Figure 7.3-1b illustrate the locations of the parkland and historic resources potentially affected by the Dulles Corridor Rapid Transit Project. To preserve the location of known archaeological resources are not mapped but have been determined in consultation with the VDHR.

7.3.1 OFFICIALLY DESIGNATED PUBLIC PARKLANDS, RECREATION AREAS, WILDLIFE AND WATERFOWL REFUGES IDENTIFIED

The following describes all public park and recreational areas identified within the study area. There are no officially designated wildlife and/or waterfowl refuges within the study area. Figures 7.3-1a and 7.3-1b shows the locations of these park resources in relation to the LPA.

George Mason High School Athletic Fields are located on a 17-acre campus south of I-66 at 7124 Leesburg Pike. This school includes playing fields that are available for general public use. The school complex is owned by the City of Falls Church.

Mount Royal Park is located north of I-66 and west of the Dulles Connector Road. This small, undeveloped park (approximately 3 acres) is adjacent to the Lemon Road Elementary School in Falls Church and the existing Metrorail West Falls Church Service and Inspection (S&I) Yard. Planned improvements to this open recreational area include the addition of a picnic area; play area, tennis courts, and an exercise area. The Fairfax County Park Authority (FCPA) owns this park.

Pimmit Run Stream Valley Park is a linear park of approximately 68 acres that follows the course of Pimmit Run. The stream runs parallel to a concrete swale spanned by the Dulles Connector Road. The parkland lies north of Idylwood Road, with discontinuous portions on either side of the Dulles Connector Road, which divides it; an informal hiking trail going under the roadways connects the two sections of the park, but this trail is not owned by FCPA and is not considered to be public parkland. Pimmit Run is not

Potential 4(f)/6(f) Resources

Dulles Corridor Rapid Transit Project

navigable under low water conditions and clearly marked trails do not currently exist under the Dulles Connector Road. This undeveloped park is owned and maintained by the FCPA and is used as a hiking trail and natural area.

Olney Park is approximately 18 acres and is located to the west of the Dulles Connector Road, south of Olney Road, and immediately north of Pimmit Run Stream Valley Park. Olney Park is a neighborhood park with various amenities for recreation activities, including two baseball fields, a basketball court, tennis courts, hiking trail, natural area, open area, picnic area, playground, tot lot, restroom facilities, and a parking lot. A stand of mature trees currently blocks the view of the noise wall adjacent to the Dulles Connector Road. The park is owned and maintained by the FCPA.

Westgate Park is approximately 12 acres in size and is located adjacent to Scotts Run Stream Valley Park. It is situated south of Route 123 and Magarity Road, where a portion of the park intersects Scotts Run Stream Valley Park. This park has two baseball fields, two lighted tennis courts, a picnic area, and an open area. The park is owned and operated by the FCPA.

Scotts Run Stream Valley Park is a 23-acre linear park that consists of an open recreation area and a hiking trail that follows the course of Scotts Run. Approximately 12 acres of the park are within the Dulles Corridor primarily in the vicinity of Route 123 and Colshire Drive. In addition, the parkland is not continuous along Scotts Run. The trail starts north of the DIAAH/Dulles Toll Road, which divides it, then follows the stream as it flows to the south side of Route 123 and east of Old Meadow Road where most of the parkland is located. This park is owned and maintained by the FCPA.

Ash Grove Historic Site, approximately 12 acres in size, is located at the southwest intersection of Route 7 and the DIAAH/Dulles Toll Road. The developer of Tysons Village townhouses dedicated the Ash Grove Historic Site to the FCPA. This site currently includes a historic house, a detached brick kitchen, and a wood-framed smokehouse. A stand of mature trees and a wall currently buffer the view of the DIAAH/Dulles Toll Road.

Wolf Trap National Park for the Performing Arts, approximately 130 acres in size, is located north of the DIAAH/Dulles Toll Road at Trap Road. This park, which is owned by the National Park Service (NPS), includes an open-air performing pavilion, restaurant pavilion, and indoor theater.

Meadowlark Gardens Regional Park is approximately 95 acres in size and is located south of the DIAAH/Dulles Toll Road on Meadowlark Gardens Court. The park has both active and passive uses, gardens, meeting and reception rooms, a gift shop, gazebos, and nature trails. The park is buffered from the DIAAH/Dulles Toll Road by a wall and trees and a residential subdivision. It is owned by the Northern Virginia Regional Park Authority (NVRPA).

Difficult Run Stream Valley Park is a linear park consisting of approximately 863 acres. The park, owned and operated by the FCPA, is located on either side of the DIAAH/Dulles Toll Road, and comprises a hiking and equestrian trail that extends into the Wolf Trap Meadow Subdivision. The trail crosses under the DIAAH/Dulles Toll Road approximately a mile west of Route 674 (Beulah Road), but this trail segment is not parkland. The Park Authority does not own the land under the highway bridges. The view of the DIAAH and Dulles Toll Road in the park itself is buffered from the north by a wall and from the south by a partial wall.

Washington & Old Dominion (W&OD) Railroad Regional Park is a 45-mile-long and 100-foot-wide recreational trail that runs between Arlington County and Loudoun County. This paved trail is used for

walking, running, and bicycling. It also includes a 32-mile adjacent gravel trail for horseback riding from Vienna to Purcellville. The trail crosses the DIAAH/Dulles Toll Road approximately one-half mile east of Wiehle Avenue. This trail is owned and maintained by the NVRPA. The W&OD Railroad Regional Park is also protected under Section 6(f) of the Land and Water Conservation Fund Act which financed its acquisition and development. In the 1960s, the federal government acquired an easement across the W&OD Railroad (prior to its conversion to parkland) for the Dulles Toll Road overpass.

Hutchinson Elementary School Athletic Fields, located southwest of Parker Avenue in the Town of Herndon, border the DIAAH/Dulles Toll Road. Through an agreement with the Fairfax County Public School District, the FCPA uses the athletic fields—two baseball diamonds and six football fields—for organized activities after the normal hours of operation.

Interim Use Soccer Fields are located on a 3.76-acre parcel east of Route 28 (Sully Road), north of the DIAAH/Dulles Toll Road. The site was proffered to the Fairfax County Board of Supervisors and has been dedicated for transportation use in the future. The soccer fields that exist on this parcel are a temporary special use until project related station facilities are warranted. Additional information on the proffer terms is provided in Appendix I.

7.3.2 ARCHAEOLOGICAL RESOURCES

Of the seven archaeological sites identified within the APE, only two of these sites are potentially eligible for listing in the NRHP. For the purposes of this Section 4(f) Evaluation, resources that have been determined to be potentially eligible for the NRHP were treated as eligible. The locations of these archaeological resources are kept confidential to protect the sites from disturbance and looting and are not provided in this report. The two archaeological resources evaluated for potential Section 4(f) impacts include:

- **44LD0379 – Indian Creek Site**. Prehistoric, early/middle archaic occupation archaeological site. This site is potentially eligible for listing in the NRHP.
- **44LD0406.** Archaeological site of prehistoric and historic occupation with artifacts dating to the early archaic period. This site is potentially eligible for listing in the NRHP.

7.3.3 HISTORIC ARCHITECTURAL RESOURCES

A total of eight historic resources were evaluated under the provisions of Section 4(f). They are described in more detail below. Figures 7.3-1a and 7.3.1b show the locations of these resources in relation to the LPA.

The Lewinsville Post Office (29-338), 1554 Great Falls Road, McLean. The Lewinsville Post Office is a two-story, front-gabled, wood-frame building with a one-story front porch. Constructed in the 1850s, it served as the Lewinsville Post Office from 1857 to 1911. The resource was placed on the Fairfax County Historic Landmarks Inventory in 1981. A Preliminary Information Form (PIF) was submitted to the Virginia Division of Historic Landmarks in 1986 for preliminary consideration for the Virginia Landmarks Register and the NRHP. Based on the information submitted, the State Review Board found on October 14, 1986, that the building was not eligible for the NRHP or the Virginia Landmarks Register. The Board stated that the property could be reconsidered if the applicants could show that the Lewinsville Post Office best represented the Town of Lewinsville as the focus of nineteenth-century social life and was the best

surviving building from that century. Although no further information appears to have been submitted, this resource was considered eligible for this evaluation.

Ash Grove (29-2), 8900 Ash Grove Lane, Vienna. This property consists of a rebuilt eighteenth-century dwelling with two historic outbuildings. Its original core was reportedly built by the Fairfax family, as early as 1790. Within the past decade, a developer purchased the property for construction of the Tysons Village townhouse complex. As part of the development, the developer proffered the site to FCPA. FCPA acquired 12 acres of the site containing the house, the detached brick kitchen, and the wood-frame smokehouse. The Sherman and Fairfax family cemetery was relocated prior to construction of the townhouse development. The property is not listed on the Virginia Landmarks Register or in the NRHP, but is potentially eligible for the latter.

Wolf Trap National Park for the Performing Arts (29-159), 1551 and 1555 Trap Road, Vienna. Presently owned by the National Park Service (NPS), the Wolf Trap National Park for the Performing Arts is a 130-acre complex consisting of an historic farm developed in the twentieth century as the country's only national park for the performing arts. The resources on this property include the original Wolf Trap Farm, the Filene Center auditorium, and its associated outbuildings.

In 1972, the Wolf Trap Farm property was entered on the Fairfax County Historic Landmarks Inventory, and the Filene Center was added to this list in 1977. VDHR files include correspondence that records efforts to create a cultural district around the property to control adjacent development. NPS completed a NRHP Inventory Nomination Form for the historic farmhouse in 1974, but the property was not formally listed in the NRHP.

Plantation (29-188), 1624 Trap Road, Vienna. Plantation is a two-story brick and frame dwelling with extensive alterations and numerous outbuildings. It was built around 1895 as a vernacular cross-gabled dwelling. Part of the Wolf Trap Farm parcel (see above), Plantation was renovated in the 1960s by Catherine Filene Shouse, the donor of Wolf Trap National Park for the Performing Arts. This site was entered on the Fairfax County Historic Landmarks Inventory in 1971. It is not listed on the Virginia Landmarks Register or in the NRHP, but is potentially eligible for the latter.

Hunter Mill Road Proposed Historic District (29-5180), Reston. The proposed district, which stretches along Hunter Mill Road from Baron Cameron Road (Route 606) to Chain Bridge Road (Route 123), is representative of a key transportation resource that has served Northern Virginia for almost 200 years. Archaeological and architectural resources along Hunter Mill Road have been identified as contributing elements to the proposed historic district. The Hunter Mill Road Proposed Historic District is significant for a number of contributions to the history of Northern Virginia, including evidence of Native American sites, the milling and farming industries in Fairfax County, association with numerous Civil War activities and people, the development of public education in Fairfax County, and the original location of Cartersville, a community established by emancipated African-American slaves. It has been determined eligible for listing in the Virginia Landmarks Register and the NRHP.

Launders House (29-240), 2300 Centreville Road, Herndon. This two-story frame dwelling was built around 1910 near the community of Floris. It is clad in weatherboard siding and sits on a concrete foundation. It was surveyed as part of the Fairfax County Historic Resources Management Plan (HRMP) in 1985. The resource is not listed on the Virginia Landmarks Register or in the NRHP, though it is potentially eligible for the latter.

Dulles International Airport Historic District (53-8). Opened in 1962, Dulles Airport encompasses approximately 11,000 acres in Fairfax and Loudoun counties and was the first airport in the world designed exclusively for jet travel. Designed by renowned Finnish-born American architect Eero Saarinen, the concrete, steel, and glass Main Terminal, which dominates the property, exemplifies the architect's efforts to combine architecture and sculpture using new technologies and materials. Saarinen won the Gold Medal Award from the American Institute of Architects posthumously in 1962 for his groundbreaking design.

The construction of Dulles International Airport included precise planning and design of all aspects of the airport, including the terminal, runways, passenger movement devices, airport services and support systems, landscaping, land use, and roadways. One important aspect of the overall design was the construction of a dedicated access road—the DIAAH—to provide an efficient and direct route to the airport from Washington, D.C. The road's original design incorporated a "dual-dual" concept that allowed for the initial construction of dedicated lanes for airport traffic only and reserved the remaining right-of-way for a parallel local roadway to be constructed at a later date. (This outer roadway, the Dulles Toll Road, was constructed in the early 1980s and widened in the late 1990s). In addition, the original 1964 Master Plan for the airport envisioned eventual construction of mass transportation to the airport and reserved the median of the DIAAH for such use. A 1985 update to the Master Plan reaffirmed the continued reservation of the median for a future transit line to the airport and anticipated that this transit access would be provided by an extension of the Washington region's Metrorail system.

In the 1970s, the Advisory Council on Historic Preservation, the Virginia Historic Landmarks Commission, and the American Institute of Architects registered concerns about proposed alterations to the significant property. In 1977, the Keeper of the NRHP asked the US Department of Transportation (US DOT) to nominate the property to the NRHP. US DOT then requested a determination of eligibility from the Keeper of the NRHP, which was made in 1978. Although the property was determined eligible under Criteria A, B, and C, it was never formally listed on the NRHP due to owner objection.

A 1989 historic architectural survey of the property identified 13 of the approximate 62 buildings at the airport as contributing buildings to a historic district associated with the Main Terminal. The proposed district encompasses the integral parts of Saarinen's original intent. Contributing buildings include the Main Terminal and control tower, a group of four maintenance and support facility buildings to the west of the terminal, the group of four service buildings east of the terminal, and two apron buildings, specifically the Apron Tower and the Triturator Building. The 18 original mobile lounges were also identified as historic structures. Terminal area landscaping and the approach road were identified as contributing landscape elements associated with the Main Terminal.

Also identified as a contributing element to this district was the "peekaboo sequence," a series of viewsheds designed by Saarinen to allow arriving passengers to gradually view structures on the airport property. Saarinen intended that this peekaboo sequence heighten viewer interest by providing passengers approaching the airport along the DIAAH a variety of views of the Main Terminal and control tower from different points along the roadway, each revealing an increasingly greater glimpse of the structures and creating a sense of dramatic expectation. Although several of the peekaboo viewsheds have been compromised or eliminated since Saarinen implemented his original design in the 1960s—a result of commercial construction, changes to the Route 28 interchange, and growth of landscaping and vegetation at the perimeter of the airport property and within the Route 28 interchange—the views that exist today remain important visual elements of the Dulles Airport historic district.

Although the peekaboo sequence has been recognized as a contributing element to the historic district, the eastern boundary of the district was not formally defined until March 2004. In consultation with VDHR, Metropolitan Washington Airports Authority (MWAA) and DRPT recommended that the eastern boundary of the Dulles Airport historic district be located 300 feet east of the Fairfax/Loudoun county line. The county line is located just east of the present Route 28 interchange. The remaining portion of the DIAAH east of this boundary is not considered part of the historic district.

House, Route 643 (53-23), Ryan. This two-story, wood-frame farmhouse with a side-gable, standing-seam metal roof is an example of a typical I-house and probably dates to the late nineteenth century. It has been covered with stucco and has a shed-roofed front porch. The property also includes several small concrete block sheds, barns, and a silo. Surveyed in 1988 (Haynes 1988), the dwelling is presently abandoned and deteriorating. The house is not listed on the Virginia Landmarks Register or in the NRHP, but is potentially eligible for the latter.

7.4 USE OF SECTION 4(f)/6(f) RESOURCES

The potential use of lands and properties protected under Section 4(f) and Section 6(f) by the project are discussed below.

7.4.1 NO BUILD ALTERNATIVE

The No Build Alternative would continue current conditions for all resources identified and would not result in any use of officially designated, parklands, recreation areas, cultural resources, or wildlife and waterfowl refuges. However, under the No Build Alternative, the provision of mass transit improvements in the median of the DIAAH as called for in the master plan for the Washington Dulles International Airport would not be realized and the project's purpose and need would not be satisfied.

7.4.2 WIEHLE AVENUE EXTENSION

The Wiehle Avenue Extension would physically incorporate part of one resource (Hunter Mill Road Proposed Historic District) protected by Section 4(f). Proximity impacts to Section 4(f) resources from the Wiehle Avenue Extension, such as noise, vibration, air quality, or visual impacts, would be minimal and would not substantially impair the activities, features or attributes of any Section 4(f) resource. No impact to Section 6(f) resources would occur. None of the archaeological sites identified are within the limits of disturbance and therefore no further Section 4(f) analysis is warranted for these sites. Table 7.4-1 at the end of this section summarizes impacts to Section 4(f) resources within the study area.

Under the Wiehle Avenue Extension, the alignment would cross three Section 4(f) and one Section 4(f)/6(f) resources. The project's use of these resources is discussed below.

Pimmit Run Stream Valley Park and Difficult Run Stream Valley Park are adjacent to the Dulles Connector Road and DIAAH/Dulles Toll Road. These parks are associated with streams that run perpendicular to and beneath these highways. Presently, these highways span both Pimmit Run and Difficult Run Stream Valley Parks. The LPA alignment is within the median of Dulles Connector Road and DIAAH/Dulles Toll Road and would also span these resources. The bridge structure and piers for the Wiehle Avenue Extension crossing would be placed parallel to the existing bridge structures and piers, outside of park property. Due to the existing conditions, these resources would not experience long-term

noise, vibration, air quality or visual impacts. Non-adverse, temporary, construction related effects would be minimal and occur only during construction of these crossings.

Washington & Old Dominion Railroad Regional Park, also a Section 6(f) resource, runs perpendicular to and underneath the DIAAH/Dulles Toll Road. A new bridge structure would span this resource as a result of the Wiehle Avenue Extension. In a concurrence letter to NVRPA dated March 2004, DRPT confirmed that the design of the Metrorail bridge would meet NVRPA's design guidelines and therefore no visual impact or tunnel effect would result; and no Section 4(f) use of this resource from the Wiehle Avenue Extension would occur. The Virginia Department of Conservation and Recreation (VDCR) has determined, in a letter dated February 2004, that the proposed action would not result in a conversion of use under the L&WCF Act because the Metrorail overpass will be within an existing transportation easement that includes highway overpasses for the DIAAH/Dulles Toll Road.

Hunter Mill Road Proposed Historic District extends underneath the DIAAH/Dulles Toll Road. The proposed historic district is potentially eligible for listing on the NRHP, but has not been formally nominated for listing. The formal boundaries of this potential district have not been determined. Depending on the determination of boundaries, the Wiehle Avenue Extension could potentially result in a physical use of this Section 4(f) resource.

The Wiehle Avenue Extension would pass over the Hunter Mill Road Proposed Historic District within the median of the existing DIAAH/Dulles Toll Road. In addition to the new crossing, three stormwater management ponds, and two traction power substations could fall within the potential district, potentially resulting in a physical use under Section 4(f). However, contributing elements of the historic district would not be used, and the property would not alter the integrity of the historic district. Each of these facilities have been sited to lessen their visibility by being placed adjacent to the DIAAH/Dulles Toll Road (within or next to the existing public right-of-way) and are not near any significant contributing elements of the potential district.

Stormwater management ponds are required to offset an increase in impervious surface that would result from the Wiehle Avenue Extension. The primary purpose of stormwater management ponds is to prevent flooding during storm events. The location of stormwater management ponds is dependent upon the natural topography within an area. Two of the stormwater management ponds are located within Virginia Department of Transportation right-of-way. The other is located adjacent to a non-contributing commercial property. The proposed design for the ponds would integrate them into the landscape, and would not detract from the visual context of the area.

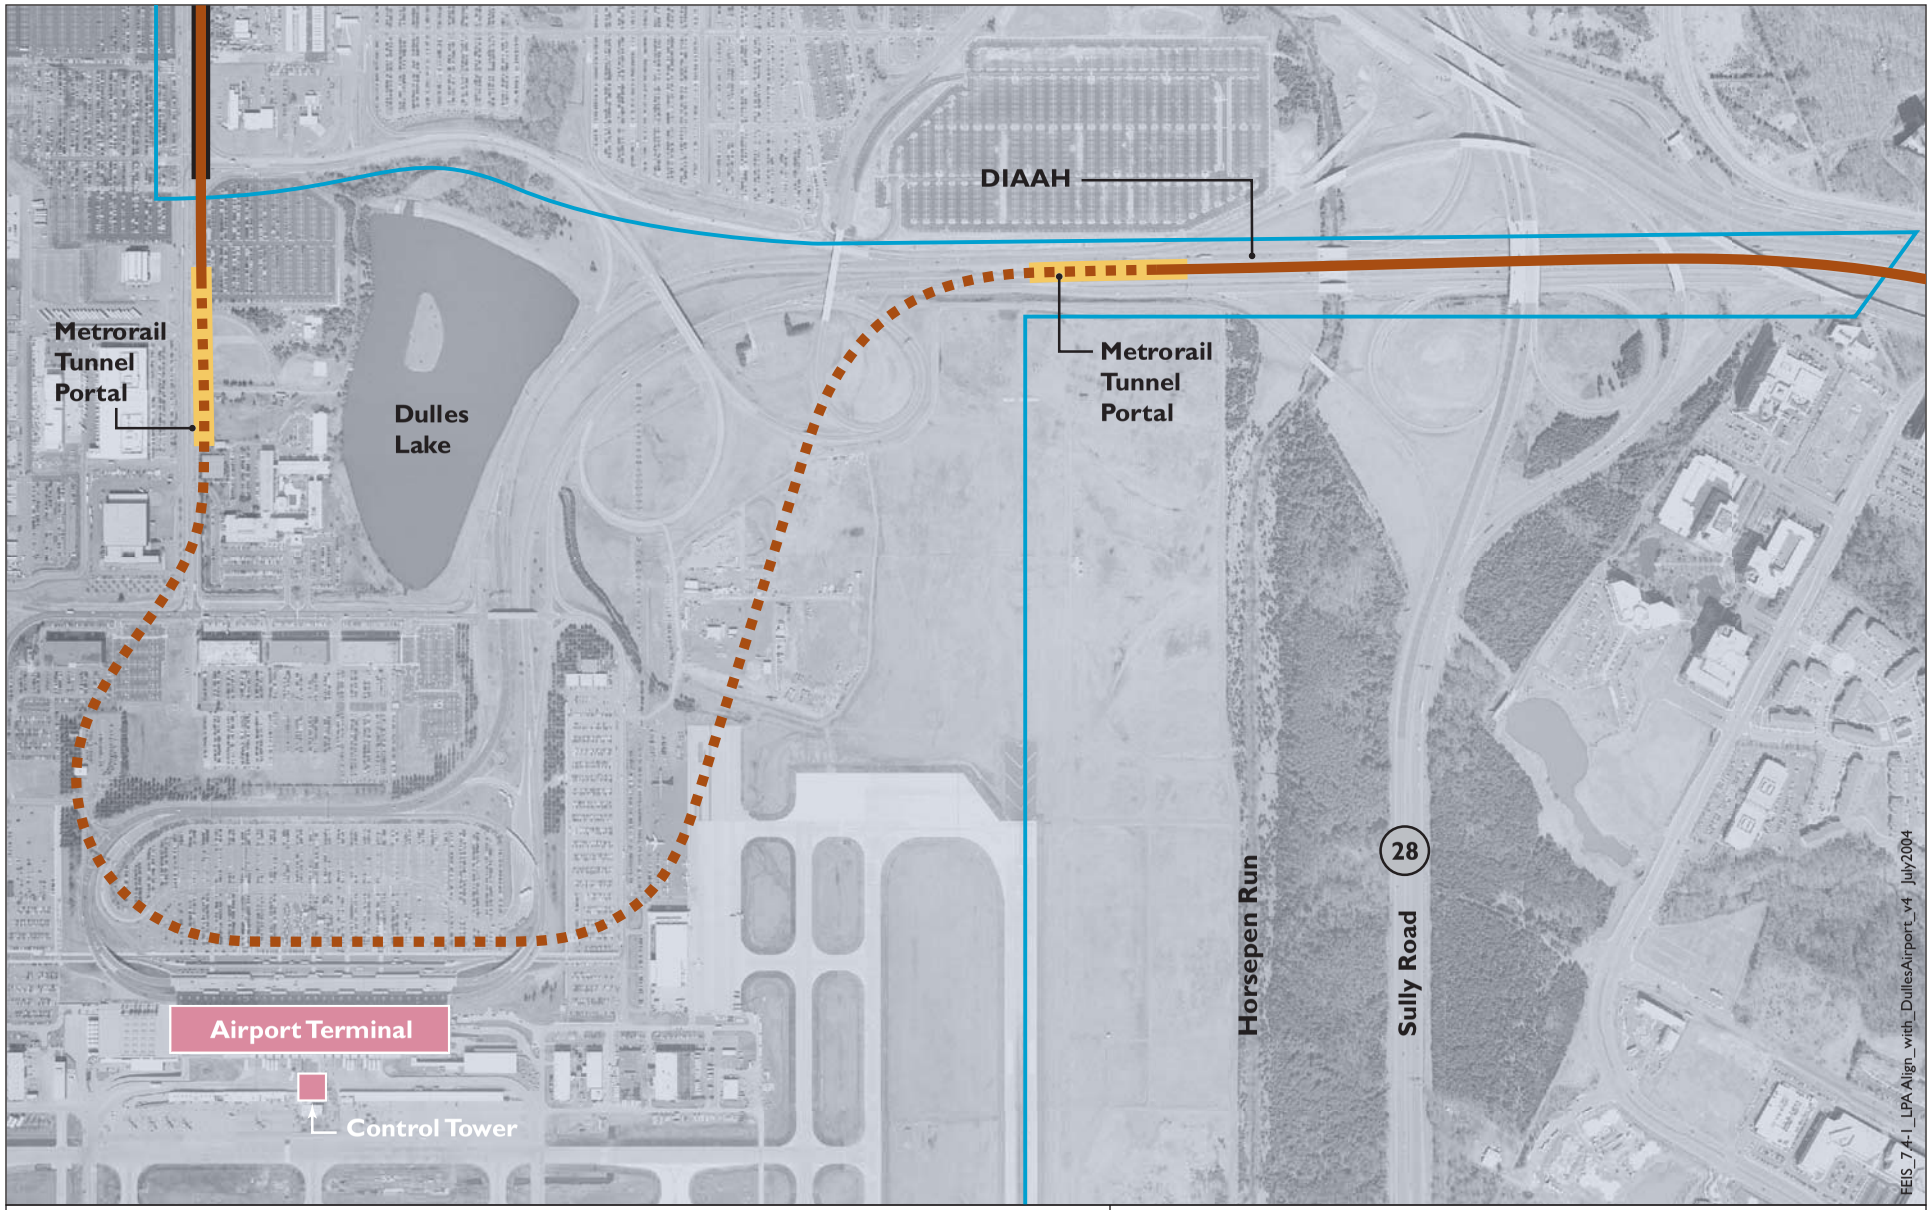
Traction power substations are facilities that supply direct current power for the rail system. A power analysis was conducted to determine the required number, size and optimal spacing of the substations. In accordance with system design and safety criteria, the traction power substations are generally small in scale and are spaced approximately every two miles. The standard traction power substation is 150 feet by 50 feet and approximately one-story high. These would be located next to the Dulles Toll Road in land zoned for commercial or industrial uses. Since the proposed district has not yet been formally nominated for the NRHP, it is possible that these facilities would fall outside the district's formal boundaries. In any case, no contributing elements of the historic district would be used.

Three other resources would experience minor proximity impacts from the Wiehle Avenue Extension. These impacts are discussed below.

Scotts Run Stream Valley Park is located adjacent to Route 123, a major thoroughfare within Fairfax County. The surrounding area consists of suburban development, with various multiple-floor commercial office buildings, apartments and transportation facilities currently within view of this resource. Route 123 has recently been widened from four to eight lanes and its crossing of the park was expanded. In addition, a new multiple-floor office building has been constructed along the eastern side of Scotts Run Stream Valley Park. The Tysons East Station would be located adjacent to the park, where the park abuts Route 123. The station would have a minimal effect on the visual character of the surrounding area and park. Due to the existing conditions of the area, the visual effects resulting from the Wiehle Avenue Extension would not result in a substantial impairment of the activities, features or attributes of this park that qualify it for Section 4(f) protection. Therefore, no use of this Section 4(f) resource would occur.

Ash Grove Historic Site is located adjacent to the DIAAH/Dulles Toll Road and a residential complex. Ash Grove would experience a one decibel (dBA) increase in noise as a result of the implementation of the Wiehle Avenue Extension. Based on the existing conditions at the site, the Wiehle Avenue Extension operations would not substantially impair the protected activities, features, or attributes of historic structures at this location. Therefore no use of this Section 4(f) resource would occur.

The **Plantation house** is located adjacent to the DIAAH/Dulles Toll Road. This historic resource would experience an increase in noise as a result of the implementation of the Wiehle Avenue Extension. Based on the existing conditions at the site, the Wiehle Avenue Extension operations would not substantially impair the protected activities, features, or attributes of historic structures at this location. Therefore no use of this Section 4(f) resource would occur.



7.4.3 FULL LPA

In addition to those effects discussed with the Wiehle Avenue Extension, the full LPA would result in impacts to Section 4(f)/6(f) resources. Construction of the Route 28 station would require the use of the **interim use soccer fields** located on the north side of the DIAAH/Dulles Toll Road. Facilities planned for the site include a Kiss & Ride lot, bus bays, and an entrance pavilion with elevators and escalators.

The site, also known as Land Bay 5 of the Dulles Green Development, was proffered to the Fairfax County Board of Supervisors for use as a temporary athletic field and/or use as a public transportation destination station, Kiss-and-Ride lot, park-and-ride facility, rail/bus transit station of other public transportation facility in 1999. Because the athletic field is considered a temporary use for the site, conversion of the site to a transportation facility would not constitute a use under Section 4(f). Excerpts from the Dulles Green Proffer detailing the terms of the land dedication are provided in Appendix I.

Dulles International Airport Historic District is eligible for listing in the NRHP. Although this district has not been formally nominated for the NRHP, a consensus-level determination of the district's boundaries has been made with the concurrence of VDHR. Based on the results of consultation with VDHR, the project's impacts to the "peekaboo" views of the main terminal control tower from the DIAAH (a contributing element to the eligible historic district) would constitute a Section 4(f) use of the resource. At the eastern edge of the historic district, the full LPA alignment is located the median of the DIAAH at-grade before transitioning underground as shown in Figure 7.4-1. In this area, the peekaboo views may be altered by security fencing required to prevent trespassers from entering the Metrorail right-of-way and

Dulles Corridor Rapid Transit Project

interfering with railroad operations. Although the design of the project in this location has already been modified to minimize the visual interference to the extent possible given site constraints and design criteria, this visual interference would constitute a use under Section 4(f).

In addition, the inbound alignment and inbound portal would use a portion of land within the historic district as the alignment transitions from at-grade to underground and the outbound portal would use a portion of land within the historic district as the alignment transitions from underground to aerial structure. This will require the acquisition of an easement from the MWAA, which operates Dulles International Airport and leases the airport property from the United States government. These portal structures would constitute a physical use of a portion of the historic district, though it would not affect the district's historic significance or integrity. In fact, this use is consistent with Saarinen's overall vision for the airport and his intent that mass transit access be provided in the future.

This use is also consistent with current airport land uses within the district. The alignment is located in areas that are currently used for transportation purposes. The at-grade and aerial portions of the LPA alignment within the proposed historic district are either within the existing DIAAH median, in a parking lot, or along existing roadways. Each of these is an existing and long-standing transportation use. The portion of the alignment that includes the peekaboo sequence is near the eastern boundary of the eligible historic district, away from other contributing structures, and in the vicinity of an interchange for three freeways. The outbound portal would be located the edge of the historic district boundary, adjacent to non-contributing elements such as an airport service roadway, parking lot, hotel, and rental car facilities.

The house on Route 643 in Ryan is located north of the Dulles Greenway. The house is abandoned and deteriorating and has been compromised by new commercial development. This historic site would experience an increase in noise; however, based on existing conditions the operation of the full LPA would not substantially impair the protected activities, features, or attributes of historic structures at this location. Therefore no use of this Section 4(f) resource would occur.

Table 7.4-1: Summary of Section 4(f) Resource Impacts Associated with the Locally Preferred Alternative

Resource	Type of Resource	Relevant LPA Activity	Impacts of the LPA			"Use" Under 4(f) (type)
			Wiehle Avenue Extension (2011)	Wiehle Avenue Extension Opening Year (2025)	Full LPA (2025)	
George Mason High School	Parkland	Proximity to West Falls Church S&I Yard Expansion	No Effect	No Effect	No Effect	No
Mount Royal Park	Parkland	Proximity to West Falls Church S&I Yard Expansion	No Effect	No Effect	No Effect	No
Pimmit Run Stream Valley Park	Parkland	Proximity to a New Bridge Structure for LPA Alignment	No Effect	No Effect	No Effect	No
Olney Park	Parkland	Proximity to LPA Alignment	No Effect	No Effect	No Effect	No
Westgate Park	Parkland	Proximity to Tysons East Station	No Effect	No Effect	No Effect	No
Scotts Run Stream Valley Park	Parkland	Proximity to Tysons East Station	Minor Visual Effect	Minor Visual Effect	Minor Visual Effect	No

Resource	Type of Resource	Relevant LPA Activity	Impacts of the LPA			"Use" Under 4(f) (type)
			Wiehle Avenue Extension (2011)	Wiehle Avenue Extension Opening Year (2025)	Full LPA (2025)	
Ash Grove Historic Site (29-2)	Parkland/ Cultural Resource	Proximity to LPA Alignment	Minor Noise Effect	Minor Noise Effect	Minor Noise Effect	No
Wolf Trap National Park for the Performing Arts (29-159)	Parkland/ Cultural Resource	Proximity to LPA Alignment	No Effect	No Effect	No Effect	No
Meadowlark Gardens Regional Park	Parkland	Proximity to LPA Alignment	No Effect	No Effect	No Effect	No
Difficult Run Stream Valley Park	Parkland	Proximity to a New Bridge Structure for LPA Alignment	No Effect	No Effect	No Effect	No
Washington & Old Dominion Railroad Regional Park	Parkland	New Bridge Structure for LPA Alignment	No Effect	No Effect	No Effect	No
Hutchinson Elementary School	Public Use Recreational Fields	Proximity to LPA Alignment	No Effect	No Effect	No Effect	No
Interim Use Soccer Fields	Interim Public Recreational Fields	Route 28 Station	No Effect	No Effect	Converts to Transportation Use	No
Hunter Mill Road Proposed Historic District (29-5180)	Proposed Historic District	Proximity To LPA Alignment; Addition Of Stormwater Management Ponds and Traction Power Substations	Requires Land Acquisition or Easement	Requires Land Acquisition or Easement	Requires Land Acquisition or Easement	Yes Physical Use (Potential)
Site 44LD0379 (Indian Creek Site)	Archaeological Site	Proximity to LPA Alignment	No Effect	No Effect	No Effect	No
Site 44LD0406	Archaeological Site	Proximity to LPA Alignment	No Effect	No Effect	No Effect	No
Lewinsville Post Office (29-338), 1554 Great Falls Road, McLean	Architectural Resource	Proximity to LPA Alignment	No Effect	No Effect	No Effect	No
Plantation (29-5180) 1624 Trap Road, Vienna	Architectural Resource	Proximity to LPA Alignment	Minor Noise Effect	Minor Noise Effect	Minor Noise Effect	No
Launders House (29-240), 2300 Centreville Road, Herndon	Architectural Resource	Proximity to LPA Alignment	No Effect	No Effect	No Effect	No
Dulles International Airport Historic District (53-8)	Historic District	LPA Alignment in Portion of District	No Effect	No Effect	Visual Effect; Requires Easement	Yes Physical Use
House, Route 643 (53-23), Ryan	Architectural Resource	Proximity to LPA Alignment	Minor Noise Effect	Minor Noise Effect	Minor Noise Effect	No

7.5 AVOIDANCE ALTERNATIVES

The LPA would result in a potential permanent use of the Hunter Mill Road Proposed Historic District and the permanent use of the Washington International Airport Historic District. Avoidance alternatives considered are discussed below.

The Hunter Mill Road Proposed Historic District would be potentially affected by the alignment and addition of stormwater management ponds and traction power substations that may fall within the district boundaries. The LPA alignment is an avoidance alternative because it keeps the alignment within the existing transportation corridor. Locating the alignment outside of this transportation corridor would result in greater use of the historic district. Stormwater management ponds are located based on topography and drainage requirements. These factors necessitate the location of the ponds within the boundary of the proposed historic district, though no contributing elements will be affected. The locations of traction power substations are dictated by energy requirements of the system and cannot be moved without potentially affecting Metrorail operations. If the boundaries of the proposed district are formally defined in a NRHP nomination prior to construction, the ponds and substations may be redesigned and shifted to lessen impacts to the extent possible, or may fall outside the district boundaries.

The Dulles International Airport Historic District would be affected by the placement of the alignment within the median of the DIAAH and the addition of inbound and outbound portals within the district boundaries. This would result in a use of a contributing element to the district (the peekaboo sequence) and require a physical use of the property within the historic district boundaries. Avoidance alternatives were not considered feasible or prudent for various reasons:

A key objective of the project is to provide rapid transit access to Dulles International Airport. Transit access to the Dulles Airport was envisioned as part of the original Master Plan. The Federal Aviation Administration (FAA) has determined that the improved access provided by the project would benefit the airport. The addition of the Metrorail also offers an alternate route to the Dulles Airport as the area's population and airport use continue to grow. By locating the LPA outside of the Dulles International Airport Historic District, it would not serve the Dulles Airport in the same capacity and would be inconsistent with the historic Master Plan, which called for the provision of transit service in the median of the DIAAH.

A rail line serving the Dulles Airport has long been planned for this location. As part of the original concept for the airport in the early 1960s, the Master Plan envisioned the eventual construction of mass transportation to the airport and reserved the median of the DIAAH for such use. In 1985, when the Dulles Airport's Master Plan was updated, the FAA recommended that the median of DIAAH continue to be reserved for a future transit line to the airport and anticipated that the future transit line would likely be an expansion of the region's Metrorail system. By incorporating mass transit within the airport complex, it would fulfill part of Saarinen's original concept for the airport.

The placement of the LPA alignment underground approaching and in front of the main terminal building avoids a more serious physical and visual impact on the historic district. Placement of the alignment on either side of the DIAAH or on an aerial alignment approaching the terminal would be more disruptive and introduce new visual obstructions in the view shed. Shifting the inbound portal eastward would require the reconstruction or reconfiguration of bridges and ramps within the Route 28/Dulles Toll Road/Dulles Greenway interchange and further degrade or destroy the remaining peekaboo views of the main terminal and control tower. Extending the outbound portal northward to completely avoid the historic district would

disrupt access to essential airport business operations, including car rental operations facilities, air cargo terminals, and employee parking.

7.6 MEASURES TO MINIMIZE HARM

Several measures would be employed that would minimize harm to those Section 4(f) resources were identified. The project's design in the vicinity of the Dulles International Airport Historic District has already been modified to minimize the effects on the district. The vertical profile of the Metrorail tracks and the concrete safety barrier within the median of the DIAAH were lowered to minimize, to the extent possible given site conditions, any obstruction of these views of the main terminal and control tower. Further lowering of this profile is not feasible given the need to maintain clearance over the 100-year floodplain of Horsepen Run and feasible Metrorail track gradients. The location of the inbound portal was shifted westward to avoid interference with the peekaboo view sequence. The location of the outbound portal was shifted northward toward the edge of the historic district into a parking lot and farther away from other contributing structures.

Access to Pimmit Run Stream Valley Park, Scotts Run Stream Valley Park, Difficult Run Stream Valley Park, and the W&OD Trail will be maintained during construction activities that have the potential to affect access to these parks/trails. Site conditions will be returned to conditions prior to construction. The new bridge that spans the W&OD Railroad Regional Park would be built in compliance with NVRPA Guideline for the Development of W&OD Trail Bridge Crossings.

As design moves forward, the project team will continue to coordinate with affected localities to identify ways to incorporate context sensitive design for proposed facilities that may be affected by the LPA alignment.

The Section 106 Memorandum of Agreement (MOA) identifies measures that will address the project's Adverse Effect on the Dulles International Airport Historic District. The MOA provides for identification of treatment measures that allow users of the Metrorail station and airport travelers to understand and appreciate the airport's unique historic characteristics, highlighting key themes or features of Eero Saarinen's original concepts for the Dulles Airport complex. Potential measures under consideration include: interpretive exhibits or artwork within the station facilities, connecting walkways, or terminal facilities; photo or video documentation of the view sequence; and pruning or removal of non-historic vegetation (trees) on airport property to enhance the historic views. Context sensitive design will be used in the design of aerial structures, portals, and station facilities within the historic district. A treatment plan incorporating these measures will be developed in accordance with the Section 106 MOA (see Appendix F).

The Section 106 MOA also establishes procedures for dealing with unanticipated archaeological discoveries.

During construction activities, the duration of the occupancy would be less than the time needed to complete the project. Construction activities would not result in permanent impacts to the identified Section 4(f)/Section 6(f) resources. After construction activities, the sites would be restored to the same or better condition.

7.7 AGENCY COORDINATION

The U.S. Department of Interior (DOI), National Park Service (NPS), Virginia Department of Historic Resources (VDHR), Virginia Department of Conservation and Recreation (VDCR), the Fairfax County Department of Planning and Zoning, the Loudoun County Planning Department, the Fairfax County School District, Fairfax County Parks Authority (FCPA), and the Northern Virginia Regional Park Authority (NVRPA) were consulted during the preparation of this Section 4(f) Evaluation and throughout the NEPA process. Agency comments and concerns are summarized below. Correspondence related to agency coordination is included in Appendix I.

In response to issues raised at the agency pre-scoping meetings in July 2000, comment letters were received from NPS, NVRPA, and FCPA. Representatives of the project team met with NPS to discuss the status of the project and potential options for a Wolf Trap National Park Station. Representatives of the team also met with NVRPA to discuss parklands and recreational resources within or near the study area.

The FCPA provided comments on the Draft EIS, stating a preference for the Metrorail alternative because it would enhance public accessibility to parkland and provide long-term protection of park resources, among other things. FCPA also commented on the potential to incorporate park and recreation related amenities at station locations and crossings within stream valley parks.

The VDCR and the NVRPA provided input on the W&OD Railroad Regional Park. Concerns were expressed over the potential effects of the alignment in regards to light requirements for the proposed crossing of this resource and the potential to impact access during construction. In 2004, VDCR determined that there would no conversion of use of the W&OD trail and NVRPA determined that the LPA crossing would not have any Adverse Effect on the W&OD trail. At that time, the project team confirmed that the proposed design of the Metrorail overpass would meet NVRPA's design guidelines.

The VDHR was contacted to discuss historic and archaeological resources in February 2001 as part of the Section 106 consultation. Additional agency coordination took place in 2003 and 2004 with VDHR and MWAA to determine eligibility of resources identified within the APE and to delineate the eastern boundary of the eligible Dulles International Airport Historic District. In May 2004, the VDHR concurred with the findings of both the April 2004 *Identification and Evaluation Report-Historic Architecture*, with the exception of one resource, and the April 2004 *Identification and Evaluation Report-Archaeology*. At that time, VDHR confirmed the National Register eligibility of the Dulles International Airport Historic District and the historic characteristics of the remaining views in the Saarinen "peekaboo" sequence. It also concluded that the impacts of the full LPA on the peekaboo sequence constitutes an Adverse Effect on the resource under Section 106. A Memorandum of Agreement (MOA) among FTA, DRPT, and VDHR has been developed to comply with mitigation requirements under Section 106 of the National Historic Preservation Act (16 USC 470). A copy of the MOA is included in Appendix F.

The June 2002 Draft EIS and the October 2003 Supplemental Draft EIS, were circulated for comment to all agencies consulted with as part of the planning process to identify potential effects on properties protected under Section 4(f). Discussions of potential 4(f) impacts to Pimmit Run Stream Valley Park, Difficult Run Stream Valley Park, Scotts Run Stream Valley Park, the W&OD Railroad Regional Park, the Ash Grove Historic Site, and Dulles International Airport Historic District were included in the Draft EIS Section 4(f) Evaluation provided to DOI and other agencies for review. The Hunter Mill Road Proposed

Historic District, determined eligible for the NRHP after the preparation of the Draft EIS, was included in the Supplemental Draft EIS and provided to agencies for review.

This final Section 4(f) Evaluation was provided to DOI for review in July 2004.

7.8 CONCLUSION

Based on the evaluation conducted and coordination with the FTA, the LPA would result in a permanent use of the Dulles International Airport Historic District and a potential permanent use of the Hunter Mill Road Proposed Historic District depending on the district's final boundaries. Construction activities near or within Section 4(f) and Section 6(f) resources would not result in any adverse temporary use of these properties. Minor proximity impacts identified would not substantially impair the protected features of the properties identified. The LPA incorporates measures to minimize impacts identified. FTA has determined that there are no feasible and prudent alternatives to the use of Hunter Mill Road Proposed Historic District and Dulles International Airport Historic District, as that use is described above, and the project included all possible planning to minimize harm, as detailed in the Section 106 MOA and measures identified above.

8 FINANCIAL ANALYSIS

This chapter describes the initial financial analysis and planning for the construction and operations of the Locally Preferred Alternative (LPA).

The alternative formerly known as "LPA Phase 1" in the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* has been renamed the Wiehle Avenue Extension in this Final EIS and is expected to begin operations in 2011. This change reflects the federal approach to the project's funding under the Federal Transit Administration's New Starts program. It will assure consistency among the environmental, engineering and financial documents during the project's development.

In the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* as well as this Final EIS, the term "full LPA" represents the Wiehle Avenue Extension and the second phase of the Dulles Corridor Rapid Transit Project. This second phase would extend west from Wiehle Avenue to Washington Dulles International Airport and Route 772 and is expected to begin operations in 2015.

The term "LPA", "proposed action", or "selected LPA" refers to both the Wiehle Avenue Extension and the full LPA collectively.

Section 8.1 is the Capital Funding Strategy. It describes the capital cost estimate, presents the expenditure schedule of capital costs, identifies the capital funding sources and shares, and describes the financing approach for the Wiehle Avenue Extension and the full LPA.

Section 8.2 is the Operating Funding Strategy. It describes the methodology of the operating and maintenance cost estimates and of Metrorail revenue forecasts, presents the Metrorail operating costs, revenues and deficit for the opening year and the forecast year, and explains the allocation of the Metrorail operating subsidy among WMATA Compact jurisdictions.

Section 8.3 is the Risk Assessment of the capital and operating funding strategies. Possible approaches for addressing these risks are also discussed.

The financial analysis and planning documented in this Final Environmental Impact Statement (EIS) reflects a level of detail appropriate for a project in the planning phase. The next phases of project development - preliminary engineering and final design - will define the project in detail, produce more reliable cost estimates and result in a final financial plan. In accordance with the Federal Transit Administration (FTA) guidance for its New Starts program, the general content of the financial plan remains the same throughout the planning and project development process.

Based on guidance from FTA, phased construction of the full LPA is necessary to spread the capital costs over a longer period of time and reduce annual Federal funding needs. Although the entire project is being evaluated for potential environmental impacts and FTA expects to issue a single Record of

Decision, only the Wiehle Avenue Extension will be advanced in the New Starts program at this time. Any FTA decision on funding the construction of the Wiehle Avenue Extension will be made without regard to future completion of the full LPA. FTA may consider the remainder of the full LPA for Federal funding in the future, but has made no commitment to do so. In that context, this chapter of the Final EIS focuses on capital and operating funding strategies for both the Wiehle Avenue Extension and the full LPA.

8.1 CAPITAL FUNDING STRATEGY

This section describes the methodology of estimates, the project construction expenditure schedule, funding sources and shares, and financing approach.

8.1.1 CAPITAL COST ESTIMATE

The capital cost estimates for the Wiehle Avenue Extension and the full LPA presented in this Final EIS are preliminary and are based on the level of engineering detail included in the Final General Plans (Volumes IV and V). The capital cost estimate is based on an implementation schedule that assumes an opening date for the Wiehle Avenue Extension in 2011; and an opening date of the full LPA in 2015. Capital costs are estimated in year 2004 dollars, and then escalated to fiscal year-of-expenditure (YOE) dollars. All references to fiscal year (FY) refer to FTA's fiscal year (October 1 through September 30). Inflation projections are used to convert 2004 dollars into year-of-expenditure amounts. The Final EIS cost estimates assume an annual 3 percent rate of inflation for all costs using the assumed construction schedules for the Wiehle Avenue Extension and the full LPA. Future refinements to the project's financial plan will apply regional inflation projections based on construction industry indices.

Tables and 8.1-1 and 8.1-2 summarize the capital costs for the Wiehle Avenue Extension and the full LPA. For planning purposes, the capital cost of the Wiehle Avenue Extension is estimated to be approximately $1.5 billion (YOE), and the capital cost of the full LPA is estimated to be approximately $3.5 billion (YOE). Any financing costs necessary to cover delays or shortfalls in funding once construction begins are not included in these estimates. A more detailed implementation schedule and refined cost estimates will be developed during preliminary engineering. The cost to complete the National Environmental Policy Act of 1969 (NEPA), as amended, environmental review process, to prepare General Plans on all alternatives of the Draft EIS, Supplemental Draft EIS, and Final EIS, and to conduct various analyses related to advancing the project in FTA's New Starts process is not included in the capital cost estimate for the Wiehle Avenue Extension or the full LPA.

Development of the capital cost estimate methodology and categories is consistent with FTA guidelines. FTA's updated standard cost categories, released in early 2004, are used for capital cost reporting. The Guideway and Track category includes the surface, aerial and subway/tunnel construction costs, including trackwork for Metrorail. The Stations, Stops, Terminals and Intermodal category includes the stations, platforms, parking lots, access roads, parking garages, pedestrian overpasses, and support infrastructure associated with the passenger stations (e.g. bus park-and-rides, Kiss & Ride). The Yards, Shops and Administrative/Support Facilities category includes vehicle storage yards and maintenance buildings, office support buildings and shop equipment. The Sitework and Special Conditions category includes anticipated costs for environmental mitigation, roadway modifications, utility modifications and demolitions. The Right-of-Way, Land, and Existing Improvement category includes land, property rights, and relocation costs, if required. The Systems category includes costs for control systems, electrification, communications, revenue collection, and vertical access (escalators and elevators). Vehicle costs

Table 8.1-1: Capital Cost Estimate and Expenditure Forecast – Wiehle Avenue Extension (Millions YOE Dollars)

FTA Standard Cost Category	Total	FY 2004	FY 2005	FY 2006	FY 2007	FY 2008	FY 2009	FY 2010	FY 2011	FY 2012	FY 2013
Guideway and Track Elements	**$362.8**	$0.0	$0.0	$0.0	$51.6	$88.5	$109.4	$93.9	$19.3	$0.0	$0.0

Total Project Costs	**$3,460.1**	**$9.4**	**$24.1**	**$77.5**	**$221.7**	**$302.7**	**$372.8**	**$359.5**	**$487.4**	**$410.1**	**$464.0**	**$428.5**	**$231.9**	**$62.9**	**$7.6**

Notes:

1. *Soft Costs* include preliminary engineering, final design, construction management, project management, owner administration, FTA and other agency coordination, insurance, and project start-up and testing.
2. *Contingency* costs include allowances for change orders.
3. Costs shown are preliminary and subject to change based on the results of preliminary engineering, design-build negotiations, and funding availability.

include new Metrorail vehicles that would operate on the Dulles Corridor line. The vehicle cost estimates are derived from a planned WMATA procurement of its Series 7000 rail cars. *Soft Costs* include preliminary engineering, final design, construction management, project management, owner administration, FTA and other agency coordination, insurance, and project start-up and testing. *Contingency* costs include allowances for change orders.

8.1.2 WIEHLE AVENUE EXTENSION CAPITAL FUNDING STRATEGY

FTA, the Commonwealth of Virginia, and Fairfax County will provide capital funding for the Wiehle Avenue Extension. WMATA and its member jurisdictions will be responsible for funding the operations and maintenance of the system, including the operating subsidy, as described in Section 8.2.

The required funding amounts from FTA, the Commonwealth of Virginia and Fairfax County for the Wiehle Avenue Extension are shown in Table 8.1-3. The share of capital funding proposed for each jurisdiction is approximate, pending the completion of preliminary engineering and a final cost allocation agreement.

That allocation agreement would outline the level and timing of funding required from each jurisdiction, and would be used to support the request to begin final design and negotiation of a Full Funding Grant Agreement (FFGA). Prior to FTA approval of final design and the FFGA, each jurisdiction will have taken the steps necessary to fully commit the funding through their respective legislative or administrative processes. This could include legislative appropriations or authorizations, board actions, and/or administrative approvals.

Table 8.1-3: Sources of Capital Funding – Wiehle Avenue Extension (Millions of YOE Dollars)

Source	Funding Level	Funding Share
Federal Sources		
5309 New Starts	$760.7	50.0%
Total Federal Funds	**$760.7**	**50.0%**
Non-Federal Sources		
Virginia Transportation Act of 2000	$75.0	5%
Dulles Toll Road Revenues	$305.4	20%
Dulles Rail Transportation Improvement District	$380.4	25%
Total Non-Federal Funds	**$760.8**	**50.0%**
TOTAL WIEHLE AVENUE EXTENSION BUDGET	**$1,521.5**	**100.0%**

8.1.2.1 Federal Transit Administration

DRPT and its funding partners are seeking $760.7 million in Federal funding for the Wiehle Avenue Extension through FTA Section 5309 New Starts program. This funding level represents 50 percent of the estimated project costs, consistent with FTA's recent practice for major transit capital investments.

A. FTA Section 5309 Funds

FTA's discretionary New Starts (Section 5309) program is the Federal government's primary financial resource for supporting locally-planned, implemented, and operated "fixed guideway" transit capital investments. FTA provides grants through this program to state and local governments for the

development of new and improved transit facilities and services. The program is discretionary and FTA's funding decisions are made on a project-by-project basis.

The New Starts program is authorized in multi-year budget cycles. For FY 1998 to 2003, the Transportation Equity Act for the 21st Century (TEA-21) authorized approximately $8.2 billion for the New Starts program. Based on the Administration's current proposal and congressional proposals, FTA expects this level of funding to be maintained in the transportation reauthorization. Therefore, continued funding of the New Starts program at these levels to support the Dulles Corridor Rapid Transit Project and other major transit capital investments in the years to come is expected. Based on guidance from FTA, an annual maximum of $100 million in New Starts program funding could be provided to support construction of the Wiehle Avenue Extension.

Section 380 of the FY 2001 Department of Transportation and Related Agencies Appropriation Act makes available additional FTA contingent commitment authority in the amount of $217.8 million specifically for the Dulles Corridor Rapid Transit Project. Contingent commitment is a tool used by the FTA to provide funding for New Starts projects beyond the limits of the current authorization. Of that contingent commitment, a total of $163.5 million in New Starts funding has been appropriated for the Project through FY 2004 to support project planning, environmental review, and engineering activities. An additional $20 million of New Starts funding for the project is expected in FY 2005. In addition to these appropriations, DRPT has requested that $600 million in additional New Starts funding be authorized for the Dulles Corridor Rapid Transit Project in the pending transportation reauthorization.

A FFGA will be required to secure any authorized federal New Starts funding for construction of the Wiehle Avenue Extension. The terms of the FFGA, including the level and timing of federal funding participation, will be finalized following completion of preliminary engineering activities.

8.1.2.2 Commonwealth of Virginia

The Commonwealth of Virginia will be responsible for funding 25 percent of the Wiehle Avenue Extension capital costs, approximately $380.4 million (YOE), using Virginia Transportation Act (VTA) of 2000 and Dulles Toll Road revenues.

A. Virginia Transportation Act of 2000

In May 2000, the Virginia General Assembly passed the Virginia Transportation Act of 2000. This legislation created the Priority Transportation Fund and authorized the Commonwealth Transportation Board (CTB) to issue Federal Reimbursement Anticipation Notes (FRANs) in the maximum aggregate principal amount of $1.2 billion outstanding at any one time. FRANs are a revolving line of credit used by the Commonwealth to fund construction of transportation improvements.

Since 2000, the CTB has issued $547.7 million in FRANs for specific public transportation, rail, highway, port, and aviation projects throughout the Commonwealth. A total of $75 million in FRAN revenues have been allocated to the Dulles Corridor Rapid Transit Project and are programmed in the *FY 2005-2010 Virginia Transportation Six-Year Program.* DRPT intends to use these funds for the local share of preliminary engineering costs.

B. Dulles Toll Road Revenues

The Dulles Toll Road, which opened in 1984, was constructed by the Virginia Department of Transportation (VDOT) and financed using Transportation Facilities Bonds issued by the Commonwealth of Virginia. Existing toll rates for automobiles range from $0.25 to $0.85, depending upon the length of the trip. Electronic toll collection is available at all toll plazas for cars equipped with transponders. Per

CTB policy, any available revenues, once debt service and operating expenses are paid must be used to finance transportation improvements within the Dulles Corridor. In September 2001, the CTB directed that a minimum of 85 percent of available revenues be dedicated to public transportation initiatives in the Dulles Corridor. These funds have been used to support construction of new transit facilities and operate the current Express Bus Service in the corridor.

To fund the Commonwealth's share of the Dulles Corridor Rapid Transit Project with available revenues and limited use of short-term financing, a toll increase is planned. Based on an initial analysis of current traffic and growth projections, a toll of $0.75 at the main toll plaza and $0.50 at each interchange ramp toll plaza provides sufficient revenues to meet the Commonwealth's obligations for the Wiehle Avenue Extension. A final decision on the revised toll structure would be made by the CTB after the completion of a formal traffic and revenue study and its administrative review process.

The Commonwealth is currently conducting a rate adjustment study for the Dulles Toll Road. This study will evaluate various tolling options and be used to secure financing supported by the Dulles Toll Road revenues. The results of the study and formal recommendations are expected in late 2004. Following this, a final decision on a revised toll structure would be made by the CTB. Any approved toll increases would be implemented in advance of construction to begin building reserves for the project, perhaps as early as January 2005.

8.1.2.3 Fairfax County

Approximately $380.4 million (YOE), representing 25 percent of the capital costs for the Wiehle Avenue Extension, would be provided by Fairfax County using revenues from the newly formed Dulles Rail Transportation Improvement District, and if necessary, General Obligation bonds.

A. Fairfax County Dulles Rail Transportation Improvement District

During the 2001 session, the Virginia General Assembly passed legislation that authorized the establishment of special transportation improvement districts within Fairfax County and the Town of Herndon to support construction of the Dulles Corridor Rapid Transit Project. In January 2004, a landowner's group submitted a petition to the Fairfax County Board of Supervisors to establish a Dulles Rail Transportation Improvement District for the Wiehle Avenue Extension. This district would support Fairfax County's share of the Wiehle Avenue Extension capital costs. The Petitioners proposed to contribute the full amount of the County's net share for the Wiehle Avenue Extension through the imposition of a voluntary tax on commercial and industrial properties within the proposed district, which includes all of the facilities needed to construct and operate the Wiehle Avenue Extension. The petition was approved by the Fairfax County Board of Supervisors in February 2004, and a commission comprised of local elected officials and a member of the CTB was appointed to govern the district. A board of landowners has also been created to advise the Commission on the management of the district.

Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of costs for the Wiehle Avenue Extension. Although payments will not be due until December 2004, on July 1, 2004, Fairfax County began charging commercial landowners an additional 22 cents per $100 of assessed value for their properties on top of the base real estate tax rate of $1.13. Fairfax County projects that the tax rate could eventually increase to 29 cents per $100 of assessed value once a Full Funding Grant Agreement is reached. The actual levy will be established each year based on current assessments and the amount of outstanding debt. The district, which had an assessed value of $6.8 billion in June 2004, is expected to generate up to $400 million for the construction of the Wiehle Avenue Extension.

State law allows Fairfax County several options for issuing debt that would be supported by the Dulles Rail Transportation Improvement District tax levy. At this time, specific details on the structure of any bond issue have not been finalized, though Fairfax County is pursuing a strategy that would achieve an investment grade rating on the bonds.

B. Fairfax County General Obligation Debt

If Transportation Improvement District revenues are not sufficient, Fairfax County may consider supporting its capital obligations for the Dulles Corridor Rapid Transit Project through a voter approved general obligation debt offering. The County is actively examining options for increasing debt capacity in the future. Fairfax County has shown a strong commitment to fund Metrorail construction by issuing $125.3 million in general obligation bonds through voter approval. In FY 2004, Fairfax County issued approximately $83.7 million in General Obligation debt, of which $14.8 million was for Metrorail construction. Fairfax County commonly issues tax-exempt general obligation bonds to finance major capital projects.

8.1.3 FULL LPA - CAPITAL FUNDING STRATEGY

The Federal Transit Administration, Commonwealth of Virginia, Fairfax County, Loudoun County, and the Metropolitan Washington Airports Authority (MWAA) would provide capital funding for the full LPA. WMATA and its member jurisdictions will be responsible for funding the operations and maintenance of the system, including the operating subsidy, as described in Section 8.2.

The capital funding strategy for the full LPA would consist of the financial plan for the Wiehle Avenue Extension, as well as a separate financial plan for the remainder of the full LPA. The latter funding plan will be similar to that of the Wiehle Avenue Extension, with the addition of MWAA and Loudoun County as funding partners. Table 8.1-4 outlines the anticipated levels of capital funding required from each funding partner for construction of the full LPA. This allocation of capital funding reflects the current status of ongoing discussions among the non-federal funding partners. The share of capital funding proposed for each jurisdiction is approximate, pending the completion of preliminary engineering and a final cost allocation agreement. That allocation agreement would outline the level and timing of funding required from each jurisdiction, and would be used to support the request to begin final design and negotiation of a FFGA. Prior to FTA approval of final design and the FFGA, each jurisdiction will have taken the steps necessary to fully commit the funding through their respective legislative or administrative processes. This could include legislative appropriations or authorizations, board actions, and/or administrative approvals.

Table 8.1-4: Sources of Capital Funding – Full LPA (Millions of YOE Dollars)

Sources of Funds	Funding Level	Funding Share
Federal Sources		
5309 New Starts	$1,730.0	50.0%
Total Federal Funds	**$1,730.0**	**50.0%**
Non-Federal Sources		
Virginia Transportation Act of 2000	$75.0	2.2%
Dulles Toll Road Revenues and Future Transportation Appropriations	$790.0	22.8%
Fairfax County Dulles Rail Transportation Improvement Districts	$557.1	16.1%
Loudoun County Public Transportation Fund	$1.9	0.1%
Loudoun County BPOL Bonds	$164.2	4.7%
MWAA Passenger Facility Charges	$141.9	4.1%
Total Non-Federal Funds	**$1,730.1**	**50.0%**
TOTAL PROJECT BUDGET	**$3,460.1**	**100.0%**

8.1.3.1 Federal Transit Administration

The FTA is being requested to fund 50 percent of the Dulles Corridor Rapid Transit Project's total capital costs through the FTA Section 5309 New Starts program, for a total estimated amount of $1,730 million (YOE). Additional information on the New Starts program is provided in Section 8.1.2.1.

8.1.3.2 Commonwealth of Virginia

Virginia will be responsible for funding 25 percent of the Dulles Corridor Rapid Transit Project's total capital costs, approximately $865 million (YOE). In addition to the Virginia Transportation Act of 2000 funds and Dulles Toll Road revenues that are planned to fund the Wiehle Avenue Extension, the Commonwealth may consider additional sources, including future transportation appropriations, to fund construction of the remainder of the full LPA. Additional information on the Commonwealth's proposed funding sources is provided in Section 8.1.2.2.

8.1.3.3 Fairfax County

Approximately $557 million (YOE), representing 16.1 percent of the project's capital costs, will be provided by Fairfax County. Fairfax County's portion of the capital costs for the Wiehle Avenue Extension would be funded by the Dulles Rail Transportation Improvement District. It is expected that Fairfax County will utilize a second tax district that includes properties west of Wiehle Avenue to fund the remainder of its share of the full LPA.

A new landowner's group, called the Western Alliance for Rail to Dulles (WARD), has formed to explore the potential of developing another tax district, similar to the Dulles Rail Transportation Improvement District, that would include properties within Fairfax County west of Wiehle Avenue. WARD has drafted a petition and began circulating it among landowners in July 2004. This petition envisions an initial rate of 5 to 7 cents per $100 of assessed value that would be used to build reserves and a rate stabilization fund. This rate would increase in later years when debt supported by the district's revenues is issued. WARD

anticipates that the maximum tax rates will be similar to those projected by Fairfax County for the Dulles Rail Transportation Improvement District.

8.1.3.4 Metropolitan Washington Airports Authority

In 1987, the operating responsibility for the Washington Dulles International Airport (Dulles Airport) and Ronald Reagan Washington National Airport (National Airport) was transferred by long-term lease from the U.S. Department of Transportation (U.S. DOT through FAA) to MWAA. The Authority was created by legislation enacted by the Commonwealth of Virginia and the District of Columbia, consistent with federal legislation authorizing the lease. The majority of the project alignment is in MWAA-controlled property in the median of the Dulles International Airport Access Highway (DIAAH). MWAA is considering the following capital funding source for its share of the full LPA.

A. Passenger Facility Charges

In 1990, Congress approved the Aviation Safety and Capacity Expansion Act, which authorized domestic airports to impose a Passenger Facility Charge (PFC) on enplaning passengers. In May 1991, the FAA issued the regulations for the use and reporting of PFCs. PFCs may be used for airport projects that must meet at least one of the following criteria: preserve or enhance safety, security, or capacity of the national air transportation system; reduce noise or mitigate noise impacts resulting from an airport; or furnish opportunities for enhanced competition between or among carriers. MWAA was granted permission to begin collecting a $3 PFC effective November 1, 1993, at National Airport and January 1, 1994, at Dulles Airport. The charges, less an administrative processing fee charged by the airlines, are collected by the airlines and remitted on a monthly basis to MWAA. Due to their restricted use, PFCs are categorized as non-operating revenue and are accounted for on the accrual basis.

In February 2001, MWAA applied for and received the authority to increase the PFC collection from $3.00 to $4.50, effective May 2001. Historically, PFC cashflows have not matched the airport's construction spending schedule. Therefore, MWAA entered into agreements to provide lines of credit. As of June 30, 2004, MWAA has utilized $187 million of a $255 million line of Flexible Term PFC Revenue Notes. These notes are rated AA-1/A-1 by Standard & Poor's. MWAA expects to redeem all the Notes by November 2009.

MWAA's PFCs are currently committed through 2017 for its current expansion program at Dulles Airport. However, MWAA anticipates it may be able to provide its share of capital funding by borrowing against future PFC revenues beyond 2017. FAA approval would be required for any use of MWAA funds towards the project.

8.1.3.5 Loudoun County

Loudoun County is a jurisdictional member of the WMATA Compact. However, because Loudoun County does not currently receive WMATA service, it does not contribute to the operations or capital budget. The introduction of the Dulles Corridor Rapid Transit Project is anticipated to add Loudon County to the other Virginia jurisdictions contributing to the WMATA budget. Loudoun County does operate its own transit services, and in FY 2002 created the Office of Transportation Services and a Public Transportation Fund to provide resources for its increasing transportation responsibilities.

Loudoun County presently funds the local share of transportation projects through the use of the local gasoline tax and the Business Professional and Occupancy License (BPOL) revenue. In FY 2004, the adopted six-year Capital Improvement Plan (CIP) allocated $1.9 million from the County Public Transportation Fund and $23 million from BPOL pledge bonds for FY 2005-2010 to the Dulles Corridor

Rapid Transit Project. Loudoun County is proposing the use of these funding sources for its share of the full LPA capital costs.

A. BPOL Bonds

BPOL bonds in the amount of $23 million have been programmed for construction of the full LPA between FY 2004 to 2008, with an additional $139.6 million in BPOL bonds programmed for FY 2010 - 2015. The County plans to divert BPOL revenues from the General Fund to provide a dedicated source of funding for the project. The loss of BPOL revenues from the General Fund is expected to be compensated through growth in other sources (largely real property taxes) resulting from continued residential and commercial development in the County.

The County currently carries a debt load of $712 million and the Notes are rated by Moody's as AAA, Standard & Poors as AA+ and Fitch as AA+. By the end of FY 2010, the level of outstanding debt is anticipated to be $988 million. County debt service has been held at a relatively constant level over the past two years. The increased debt load is anticipated to increase the debt service obligation from $96 million in FY 2005 to $145 million by FY 2010.

B. Loudoun County Public Transportation Fund

Funds in the amount of $1.9 million were programmed for full LPA construction-related activities in FY 2004.

8.1.4 FUNDING SECURED TO DATE

To date, federal and state funding sources for the Dulles Corridor Rapid Transit Project include both appropriations and future funding commitments. Funds secured, or authorized to date for the project total over $650 million. This includes $163.5 million in Section 5309 New Starts funding for the project appropriated between FY 1999 and FY 2004, $75 million in VTA 2000 funding, $3 million in excess Dulles Toll Road revenues, and $10.6 million in allocations from Commonwealth Transportation Fund sub-accounts. Another $400 million was recently authorized with the formation of Fairfax County's Dulles Rail Transportation Improvement District.

To date, $32 million in federal funding and $13.6 million in Commonwealth funding has been used to complete the NEPA environmental review process, to prepare General Plans on all alternatives of the Draft EIS, Supplemental Draft EIS and Final EIS, and to conduct various analyses related to advancing the project in FTA's New Starts process. No funds from the Dulles Rail Transportation Improvement District, Loudoun County or MWAA have been used to date.

8.1.5 CAPITAL FINANCING APPROACH

The capital financing approach for both the Wiehle Avenue Extension and the full LPA is discussed below.

8.1.5.1 Wiehle Avenue Extension

During preliminary engineering, DRPT will prepare a final financial plan for the Wiehle Avenue Extension and negotiate funding agreements with its non-federal funding partners, all in support of a FFGA with FTA. A preliminary financial plan for the Wiehle Avenue Extension was prepared by DRPT in August 2003 in support of its request for preliminary engineering approval. That plan identified the financing tools and capital financing approaches (which are summarized below) most likely to be used for construction.

An updated and more detailed capital financing plan will be prepared during preliminary engineering to support the FFGA, local funding agreements, and any required debt issues.

Federal Funding. For the Wiehle Avenue Extension capital plan, federal New Starts funding of $100 million per year is assumed to be available for construction expenditures between FY 2006 and 2011. These funds would be combined with prior federal appropriations and non-federal funding to match the construction expenditure schedule. No long-term financing of federal funds for the Wiehle Avenue Extension construction is anticipated. Short-term financing, through a letter of credit or similar mechanism may be required if annual federal funding levels do not match the terms of the signed FFGA.

Commonwealth of Virginia Funding. With the proposed toll increase, the excess Dulles Toll Road revenues available through 2015 are sufficient to fund the Commonwealth's share of the Wiehle Avenue Extension capital costs on a "pay-as-you-go" basis. However, to meet the proposed implementation schedule, debt financing would be used for a portion of the construction expenditures. New Commonwealth debt (revenue bonds) issued on behalf of the Dulles Corridor Rapid Transit Project would be repaid with future Dulles Toll Road excess revenues. A variety of debt financing instruments, including short-term, long-term, and variable rate debt, are available to the Commonwealth. The terms and repayment schedules would vary depending on the type of debt instrument used. In the past, the CTB has issued debt on behalf of the Commonwealth for transportation projects. The Commonwealth may also consider a Transportation Infrastructure Financing and Innovation Act (TIFIA) loan or issuance of additional FRANs to finance a portion of its capital contribution. A final determination on the most appropriate type of debt financing will be made during preliminary engineering based on an evaluation of statewide transportation needs and current market conditions.

Fairfax County Funding. Fairfax County's primary contribution to the construction costs of the Wiehle Avenue Extension would be supported by tax revenues generated by the Dulles Rail Transportation Improvement District. New long-term debt would be issued. Fairfax County anticipates that this debt would be issued in two installments in FY 2007 and FY 2008. State law allows Fairfax County several options for issuing debt that would be supported by the Dulles Rail Transportation Improvement District tax levy. At this time, specific details on the structure of any bond issue have not been finalized, though Fairfax County is pursuing a strategy that would achieve an investment grade rating on the bonds. The final terms and timing of any new debt supported by the Transportation Improvement District will be determined by Fairfax County and the District Commission.

8.1.5.2 Full LPA

Because FTA is now advancing only the Wiehle Avenue Extension in the New Starts program, a detailed financing approach has not been developed for the full LPA. A preliminary financial plan for the full LPA will be developed subsequently, when DRPT seeks approval from FTA to advance that portion of the project into preliminary engineering. As with the Wiehle Avenue Extension, a more detailed financial plan would then be developed to support an FFGA for the remainder of the full LPA.

8.2 OPERATING FUNDING STRATEGY

Upon its acceptance of the Dulles Corridor Rapid Transit Project, WMATA will operate Metrorail service in the Dulles Corridor. WMATA's acceptance of the project is contingent upon fulfillment of the following seven conditions:

1. Satisfactory completion of the Final EIS;

2. Issuance of a Record of Decision (ROD) by FTA;

3. Board approval of a final financial plan for the construction, acquisition and operation of the new facilities;

4. Execution of implementing financial commitments between DRPT and funding sources in the form of local funding agreements and the federal FFGA;

5. WMATA's determination that the project has been completed in accordance with the Final EIS, approved General Plans and all WMATA system requirements and that the project, as built and tested, is suitable for acceptance into the Adopted Regional System;

6. Conveyance to WMATA by DRPT of a property interest in the project property adequate to assure WMATA's continuing control of the project property throughout the useful life of the project; and

7. Any indemnification obligation from WMATA to Toll Road Investors Partnership II (TRIP II), MWAA, or any other entity associated with the project is subject to Board approval and any indemnification obligation provided by DRPT to TRIP II, MWAA, or any other entity associated with the project will be subject to a determination by WMATA that such indemnification does not create a liability or potential liability for WMATA.

As DRPT prepares the final financial plan for the Wiehle Avenue Extension during the preliminary engineering (PE) phase, DRPT will work closely with WMATA on the final operating funding plan of operating costs, revenues and subsidy. At this time, operation of the Dulles Corridor Rapid Transit Project consists of Metrorail service for a system that has a reconfiguration of lines and longer headways and that has the Wiehle Avenue Extension in 2011 and the full LPA in 2015, and existing and enhanced local and express bus services by Fairfax and Loudoun Counties and WMATA as feeders to the proposed Metrorail extension.

8.2.1 OPERATING AND MAINTENANCE COSTS

The estimated, annual incremental Wiehle Avenue Extension and full LPA operating and maintenance (O&M) costs in year of expenditure (YOE) dollars for the opening years and forecast year (2025) for Metrorail are presented in Tables 8.2-1 and 8.2-2. For the Wiehle Avenue Extension at the time of its opening in 2011, the increment is $47.47 million, rising to $67.64 million in 2025. These costs are a 6.8 percent increase over the costs of the No Build Alternative in 2025.

Systemwide costs for Metrorail were developed by using WMATA’s new operating and maintenance cost model calibrated for WMATA FY 2004 data, based on costs by WMATA management center and by object class.

Tables 8.2-1 and 8.2-2 present the annual, incremental changes to the O&M costs, revenue and subsidy allocation to WMATA Compact jurisdictions for the Wiehle Avenue Extension and the full LPA. Opening year and forecast year results are provided for comparison.

Table 8.2-1: Compact Member Incremental Subsidy Requirements for the Wiehle Avenue Extension (Millions of YOE Dollars)

	Wiehle Avenue Extension	
	Opening Year 2011	Forecast Year 2025
Metrorail O&M Costs	$ **47.47**	$ **67.64**
Metrorail Operating Revenue	$ **(27.52)**	$ **(39.48)**
WMATA Compact Member Subsidy		
District of Columbia	$ **4.64**	$ **5.60**
Virginia[1]	$ **9.75**	$ **15.56**
Alexandria	$ 0.67	$ 0.85
Arlington County	$ 1.45	$ 1.86
Fairfax City	$ 0.09	$ 0.12
Fairfax County	$ 7.48	$ 12.63
Falls Church	$ 0.07	$ 0.11
Loudoun County	$ -	$ -
Maryland[1]	$ **5.55**	$ **7.01**
Montgomery County	$ 2.88	$ 3.80
Prince George's County	$ 2.67	$ 3.21
Total Subsidy	$ **19.95**	$ **28.17**

[1] Internal totals may not tally precisely due to rounding.
Operating subsidies distributed to Virginia jurisdictions are supported with state formula assistance.

Table 8.2-2: Compact Member Incremental Subsidy Requirements for full LPA (Millions of YOE Dollars)

	Full LPA	
	Opening Year 2015	Forecast Year 2025
Metrorail O&M Costs	$ **93.92**	$ **117.88**
Metrorail Operating Revenue	$ **(63.42)**	$ **(79.37)**
WMATA Compact Member Subsidy		
District of Columbia	$ **3.91**	$ **2.96**
Virginia[1]	$ **21.52**	$ **30.83**
Alexandria	$ 0.63	$ 0.56
Arlington County	$ 1.37	$ 1.26
Fairfax City	$ 0.09	$ 0.11
Fairfax County	$ 11.35	$ 16.32
Falls Church	$ 0.09	$ 0.10
Loudoun County	$ 8.00	$ 12.46
Maryland[1]	$ **5.08**	$ **4.73**
Montgomery County	$ 2.71	$ 2.70
Prince George's County	$ 2.37	$ 2.03
Total Subsidy	$ **30.50**	$ **38.51**

[1] Internal totals may not tally precisely due to rounding.
Operating subsidies distributed to Virginia jurisdictions are supported with state formula assistance.

8.2.2 OPERATING REVENUES

Several operating funding sources are proposed as revenue streams for the Dulles Corridor Rapid Transit Project. The majority of operating revenues would come from farebox revenues and the annual operating subsidy provided by member jurisdictions of the WMATA Compact. The WMATA Compact is an agreement among Virginia, Maryland and the District of Columbia that governs the management and operation of the Washington region's Metrorail, Metrobus, and MetroAccess systems. The annual incremental Metrorail subsidy is allocated among its members using an established and approved formula. As an extension to the existing Metrorail system, the Project will add Metrorail operating revenue but it would not be sufficient to cover the costs of the project, thus increasing the Metrorail subsidy. Existing and potential sources of operating funds are described below.

8.2.3 PASSENGER FARE REVENUES

Fare revenues have been estimated for the Metrorail system with the Wiehle Avenue Extension and with the full LPA, based on ridership projections, FY 2005 fare structure and periodic fare increases. The impacts of fare increases on projected ridership are included, adjusted for fare elasticities. These elasticities account for the fare increase impact on ridership characteristics and the resulting revenue yields. This approach generates a conservative estimate of passenger fare revenues.

8.2.4 OTHER SYSTEM REVENUES

Joint Development Revenues: This will include potential development above transit stations, station facilities, and line as well as connections to development on adjacent properties. WMATA already has a successful joint development program that has generated revenue contributions to the operating budget for many years. Projection of these revenues will be based on development opportunities identified during the design process and in the outreach with stakeholders, including major property owners and real estate developers in the Dulles Corridor. Joint development income is an important source of operating revenue for WMATA, amounting to $11 million of the total $473 million Metrorail operating budget in FY 2003.

Parking Revenues: WMATA is one of the few rapid transit systems in the U.S. that charges for parking at its stations. Parking fees are determined as part of the WMATA Tariff and through fare policy discussions with the WMATA Board and local jurisdictions. The parking fee has two components: a) the cost of daily operations and maintenance of the parking facilities, and b) a parking surcharge that, in coordination and consultation with local jurisdictions, is used to construct additional parking facilities at Metrorail stations.

Advertising: This includes revenues generated from advertising on vehicles and in stations. Advertising revenues are generally based on contract rates negotiated with national advertising firms. The Dulles Corridor Rapid Transit Project will contribute incrementally to the existing WMATA program.

Concessions: This includes income from telephones, vending machines, and (potentially) retail operations within stations.

8.2.4.1 Federal Funds

Federal funding to support Metrorail operations may be provided from two programs.

1. **Section 5307 Urbanized Area Formula Funds**: These grants are applied to capital projects and preventive maintenance; that is, maintenance activities in the operating budget that may be classified as capital for the purpose of qualifying for Section 5307 grants.

2. **Congestion Mitigation Air Quality (CMAQ) Funds**: Allocation of these resources is based on regional consensus through the region's Transportation Planning Board. CMAQ funds may be used for operations in the first three years of new transit service.

8.2.4.2 State Funds

The Commonwealth of Virginia may support Project operations with funding from the DRPT Formula Assistance. DRPT administers this formula assistance program to local transit operators throughout the Commonwealth. The Northern Virginia Transportation Commission annually receives at least 60 percent of total program funds, which it passes through to Northern Virginia localities to support local transit operating needs, including Metrorail operations. In FY 2005, DRPT will provide $51.6 million in formula assistance.

8.2.4.4 Projected WMATA Subsidy Allocation

For FY 2005, WMATA's budget for operating and maintenance costs of Metrorail, Metrobus, and MetroAccess is $872.3 million, of which Metrorail costs will account for about 57 percent of the total. WMATA Compact jurisdictions contribute to the agency's annual operating budget deficit in accordance with Board-approved allocation formulas that reflect ridership and service levels for Metrorail, Metrobus, and MetroAccess service. The Compact jurisdictions' contribution to WMATA's FY 2005 operating deficit for Metrobus, Metrorail, and MetroAccess is $402.2 million.

The WMATA policy for the funding of operating deficits for extensions to the Metrorail system, such as the proposed Dulles Corridor Rapid Transit Project, is stated in the WMATA Board of Directors Resolution #2000-35, dated May 25, 2000:

> "The operating deficit of an extension will be allocated among all the Compact member jurisdictions in accordance with the formula in effect for the funding of the Metrorail operating deficit in the years that such deficit occurs."

The rail subsidy consists of two separate allocation formulas: the rail maximum fare formula and the base rail subsidy formula. The total maximum fare subsidy is deducted from the total rail subsidy and the result is allocated based on the base rail subsidy formula. The base rail subsidy allocation formula determines the subsidy share of the Compact jurisdictions, based on three elements in the following proportions:

1. One-third of the relative number of stations in operation in each jurisdiction.

2. One-third of the subsidy is distributed on the basis of a **weighted average of urbanized area population and population density** using census data and the census population definition of the urbanized area.

3. One-third of the subsidy is distributed on the basis of the **weekday Metrorail passengers by jurisdiction of residence.**

The maximum fare subsidy is one-half the revenue differential between what riders traveling more than six composite miles actually pay and what they would have paid without a tapered mileage charge or a fare limit. The allocation of this subsidy by jurisdiction is determined from the Metrorail passenger survey.

The charge to each jurisdiction reflects the residence of the riders receiving the benefit of the reduced regular fares and the value of the benefit received. The estimated amount of the max-fare subsidy for FY 2005 is $4.5 million (less than one percent of the operating budget). The results presented in this section have been allocated solely by the base subsidy formula.

The systemwide revenues from fares and the other operating revenue previously described are subtracted from systemwide costs to yield the operating subsidy for WMATA Compact member jurisdictions. The WMATA Compact subsidy allocation is based on the Metrorail Subsidy Allocation Formula.

8.3 RISKS AND UNCERTAINTIES

Although the financial analysis defines a proposed funding strategy based on secured funding to date and reasonable funding source, financing and cost assumptions, there are a number of risks that could influence the stability of the project's financial plan, including construction cost risk and operating cost risk.

8.3.1 CONSTRUCTION COST AND REVENUE RISK

Differences between projected and actual construction costs may occur because of unforeseen conditions, variations in construction unit cost, bid quantities, changes in design elements, mitigation of environmental impacts, or special security measures that may be required for transit facilities. Some of the conditions that may affect actual construction costs include the following:

Changes in Design or Construction Conditions. Differences in construction costs may occur because of changes in technology requirements; unforeseen conditions such as soil and utility relocations; and changes in design elements.

Real Inflation. The rate of inflation may vary, significantly affecting the base unit costs.

Dedicated Revenues. Variations in dedicated revenues from participating jurisdictions may affect the ability to provide capital funding or cover debt service.

Schedule. Delays in the construction schedule may increase the overall project cost and extend the inflation risk.

Capital Funding Availability. The availability of capital funds from Federal, state and local jurisdictions affects the timing and overall cost of the project. Delays may result in additional financing requirements or schedule adjustments.

Interest Rates. Variations in interest rates impact the long-term debt service payments.

Financing Approach. There are many variations to the debt issuance requirements, including some that are market driven. The debt issuer, terms, and schedule may change the project's financing costs.

8.3.2 OPERATING COST AND REVENUE RISK

Differences between projected and actual bus and rail operating costs may impact the anticipated subsidy requirements to address the gap between revenue and expenses. Some of the conditions that may affect actual operating costs include the following:

Fares, Fare Policy and Cost Recovery. Changes in fare levels and structures affect ridership, fare revenue and cost recovery. Changes in ridership affect the level of service required, which affects capital and operating costs.

Service Levels. The frequency of service and hours of operation affect ridership, fare revenue, capital and operating costs.

8.3.3 RISK ASSESSMENT AND MITIGATION

FTA has established procedures for identifying, assessing and mitigating risks associated with major transit capital projects in preliminary engineering and final design. As of FY 2004, FTA is undertaking risk assessment through its Project Management Oversight (PMO) process. PMO contractors have been assigned to the specific projects to assess the capital and operating risks, and identify potential strategies for addressing them. The steps involved in FTA's risk analysis process include: 1) Validation of Base Conditions, 2) Risk Identification and Quantification, 3) Assessment and Modeling, 4) Implementation and Monitoring, and 5) Risk Mitigation Planning. Possible strategies identified by FTA that are available to mitigate for risk include corrective management actions, contract language that shares risks with or transfers risks to other parties, purchase of insurance to mitigate project risks; and additional unallocated contingencies in the project budget.

Based on the results of the risk assessment conducted by FTA, DRPT and WMATA will incorporate appropriate risk mitigation strategies into the financial plan as it is further refined and finalized during preliminary engineering.

9 SECONDARY AND CUMULATIVE EFFECTS

This chapter presents the long-term secondary and cumulative effects of the No Build Alternative, the Wiehle Avenue Extension, and the full LPA. The secondary effects associated with construction of the Wiehle Avenue Extension and the full LPA would result primarily from induced development (also referred to as secondary development) at transit station areas. Potential cumulative effects would occur due to construction of the Wiehle Avenue Extension and the full LPA in addition to the past, present, and future reasonably foreseeable projects described for the No Build Alternative in Chapter 2.

The alternative formerly known as "LPA Phase 1" in the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* has been renamed the Wiehle Avenue Extension in this Final EIS and is expected to begin operations in 2011. This change reflects the federal approach to the project's funding under the Federal Transit Administration's New Starts program. It will assure consistency among the environmental, engineering and financial documents during the project's development.

In the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* as well as this Final EIS, the term "full LPA" represents the Wiehle Avenue Extension and the second phase of the Dulles Corridor Rapid Transit Project. This second phase would extend west from Wiehle Avenue to Washington Dulles International Airport and Route 772 and is expected to begin operations in 2015.

The term "LPA", "proposed action", or "selected LPA" refers to both the Wiehle Avenue Extension and the full LPA collectively.

This section of this chapter discusses the following topics:

Section 9.1 describes the general methodology used to conduct the secondary and cumulative effects analysis.

Section 9.2 identifies the resources that could be sensitive to secondary or cumulative impacts.

Section 9.3 contains the analysis of potential secondary effects.

Section 9.4 contains the analysis of potential cumulative effects.

Section 9.5 includes a discussion of mitigation.

As described in the Draft Environmental Impact Statement (EIS), several resources were evaluated for secondary effects, including neighborhoods, community services and cohesion; displacements; visual and aesthetic conditions; cultural resources; parks and recreational resources; geologic resources; water resources; aquatic biota and habitat; terrestrial biota and habitat; rare, threatened, and endangered species; and traffic and associated air quality impacts. Most of these resources were also assessed for

cumulative effects. However, if the proposed project does not result in an impact to a certain resource, then it would be considered as not contributing to cumulative impacts to that resource.

9.1 GENERAL METHODOLOGY

The process used to evaluate secondary and cumulative effects is based on the guidance provided in the Federal Highway Administration Technical Advisory, "Guidance for Preparing and Processing Environmental and Section 4(f) Documents" (October 30, 1987). It involves the identifying sensitive resources and area of effect, sources of potential secondary and cumulative effects on resources, and potential effects.

Each of these steps is described briefly in the following sections.

9.1.1 IDENTIFY SENSITIVE RESOURCES AND AREA OF EFFECT

The first step in the process is the identification of sensitive resources to be analyzed for effects. These resources would include: those that are directly affected by the Wiehle Avenue Extension or the full LPA, those affected by the secondary development that is associated with the stations under consideration, and those resources that are particularly susceptible to cumulative effects (e.g., wetlands can experience multiple individual impacts from many projects over time, that when summed result in cumulative effects). Not all impacts tend to "accumulate"—that is, similar impacts from more than one project do not always add together and create a greater impact. However, some resources may experience project impacts that result in minimal change, but when impacts from several actions are summed cumulatively, they may experience greater effects over time.

Sensitive resources were identified using the environmental information prepared for the various sections of this Final EIS, as well as public and agency scoping comments received. In addition, the agencies shown in Table 9.1-1 were contacted to request information regarding sensitive resources and other major actions that should be considered in determining cumulative effects. After the sensitive resources were identified, a composite map of the resources was prepared to determine an overall geographic boundary for the analysis. This methodology to determine a unified geographic boundary is consistent with secondary and cumulative effects analyses being conducted in other states.

Table 9.1-1: Agencies Contacted for Secondary and Cumulative Effects Analysis

Federal Agencies	State Agencies
Federal Aviation Administration, Office of Airports Planning & Programming	Virginia Department of Historic Resources, Northern Regional Preservation Office
Federal Aviation Administration, Washington Airports District Office	Virginia Department of Game and Inland Fisheries
National Marine Fisheries Service, Northeast Region Public Affairs Office	Virginia Department of Historic Resources, State Historic Preservation Office
National Park Service, National Capital Region	Virginia Department of Transportation
National Park Service, Wolf Trap Farm Park	Virginia Marine Resources Commission
Smithsonian's National Air and Space Museum	Virginia Outdoors Foundation
U.S. Army Corps of Engineers, Norfolk District	**County Agencies**
U.S. Army Corps of Engineers, Northern Virginia Field Office	Fairfax County Executive
U.S. Army Corps of Engineers, Northern Virginia Reg. Section	Fairfax County Department of Transportation
U.S. Department of Agriculture, National Resource Conservation Service	Fairfax County Economic Development Authority
	Fairfax County Community & Recreation Services

Federal Agencies	County Agencies
U.S. Department of Agriculture, Virginia Conservationist	Fairfax County Park Authority
U.S. Environmental Protection Agency	Fairfax County Planning and Zoning
U.S. Fish & Wildlife Service, Virginia Field Office	Fairfax County Public Works and Environmental Services
Regional Agencies	Fairfax County Water Authority
National Capital Planning Commission	Loudoun County Building and Development
Northern Virginia Regional Commission	Loudoun County Administrator
Metropolitan Washington Airports Authority, Planning	Loudoun County Parks, Recreation and Community Services
Metropolitan Washington Airports Authority, President	Loudoun County Transportation Planning Program
Metropolitan Washington Council of Governments	Loudoun County Planning
Northern Virginia Regional Park Authority	**Local Agencies**
Northern Virginia Soil and Water Conservation District	City of Falls Church, Planning Department
State Agencies	City of Falls Church, City Manager
Virginia Department of Aviation	Dulles Greenway, Director of Operations
Virginia Department of Environmental Quality	Town of Herndon, Community Development
Virginia Department of Forestry	

The study area for the cumulative effects analysis was based on a combination of factors. Within Fairfax County, the corridor boundary, which was largely based on the travel shed, was used. Fairfax County is currently highly developed and the corridor boundary was drawn to include the greatest number of trips that would be drawn to the new transit improvements. In Loudoun County, this area was modified to follow the various watershed boundaries of the streams that traverse the Dulles Corridor. These boundaries were used because Loudoun County is more rural in character and cumulative effects would be more likely to involve natural resources. Therefore, the watershed boundaries were used to define the study area. Figure 9.1-1 presents the study area for the secondary and cumulative effects. The horizon year for the analysis is 2025.

9.1.2 IDENTIFY POTENTIAL SOURCES OF EFFECTS

By definition, the sources of secondary and cumulative effects are the Dulles Corridor Rapid Transit Project and the other actions planned within the project's area of influence. These other actions, which are included as part of the No Build Alternative, are listed in Table 9.1-2.

For the Dulles Corridor Rapid Transit Project, the primary source of potential secondary effects is the increased development allowed at the station areas for the Wiehle Avenue Extension and the full LPA. Though the addition of transit does not directly cause development to occur, county comprehensive plans have been modified to ensure that new development is located in the vicinity of stations if a new transit line is built. This induced increase in development has the potential to have effects on social, environmental, and transportation conditions beyond those directly associated with the proposed project.

During the public scoping process for the project, the potential for secondary effects due to increases in the allowable density of development were of primary concern to local citizens. Commenters consistently requested an analysis of the effects that increased density would have on traffic congestion and their quality of life. Fairfax County officials also requested an analysis of the effects of increases in allowable densities.

Secondary and Cumulative Effects Study Area

Dulles Corridor Rapid Transit Project

There are a variety of other potential transportation projects within the study area for secondary and cumulative effects that are in the initial planning phase. These projects include major transportation projects such as the I-66 widening and Metrorail Orange Line extension project, the Tri-County Parkway Location Study and other initiatives. In addition, there are local improvements listed in the comprehensive plans of Fairfax and Loudoun counties. However, projects such as the Edmund Haley Drive underpass and the Rock Hill Road overpass are in the initial stages of planning and no definitive information is available as to their likely construction, preferred location, funding and impacts. Consequently, these projects are not considered to have reasonably foreseeable effects on this project and are not included in this analysis.

Table 9.1-2: Other Projects or Actions Included in the Cumulative Effects Analysis

Project	Description
Transit Projects (Included in No Build Alternative)	
New Bus Access Slip Ramps on DIAAH and Dulles Toll Road	Construction of new bus-only, at-grade slip ramps to allow for bus access between the DIAAH and Dulles Toll Road and to improve safety and schedule reliability. Three of the ramps have been constructed and are in use.
Expansion of Reston East Park-and-Ride	Fairfax County has studied alternatives designed to expand the Reston East Park-and-Ride to include a multi-level garage with 2,300 spaces by 2010.
Highway Projects (Included in No Build Alternative)	
Route 123	Route 123 within Tysons Corner from Route 7 to I-495 is planned for expansion from six to eight lanes by 2010.
Route 7	Route 7 within Tysons Corner is planned for expansion from six to eight lanes by 2010. Route 7 is also planned for expansion from four to six lanes between Reston Parkway and the Dulles Toll Road, and Rolling Holly Drive and Reston Parkway.
DIAAH Widening	The Access Highway from Dulles Airport to Route 123 is planned for expansion from four to six lanes by 2010.
I-495	A section of the Capital Beltway, I-495, from the I-9/I-395/I-495 interchange and the American Legion Bridge is planned for capacity improvements, including HOV lanes and ramps providing direct HOV access to Tysons Corner at Route 123. Implementation of these improvements is anticipated by 2010.
Route 7100	Route 7100 is planned for expansion from four to six lanes between I-66 and Sunrise Valley Drive by 2010.
Route 50	A segment of Route 50 between Old Lee Road and the Fairfax/Loudoun County line is planned for expansion from four to six lanes by 2020.
Route 28 Improvements	This is a design/build project to widen Route 28 from six to eight/ten lanes from I-66 to Route 7 and to add interchanges (to be completed in 2005); the project is included in the 2003 update of the CLRP and 2002-2007 TIP; the project accommodates a possible, future light rail guideway.
Loudoun County Parkway	This is a two- to four-lane, north-south roadway, which will link the Dulles Greenway and Route 7 and be widened to a four- to six-lane facility by 2010.
Other Projects (Other Actions not Transit Related)	
Wolf Trap Master Plan Improvements	Expanded and improved parking and circulation improvements at the park.
Dulles Airport Layout Plan Improvements	MWAA is implementing or planning the following improvements: the newly opened Smithsonian Air and Space Museum, Tier 2 concourse improvements, airside automatic people mover (APM), on-airport roadway improvements, runway reconstruction, new control tower, and two new runways with associated projects. The two new runways are a new parallel north-south runway, approximately 9,473 feet long by 150 feet wide and a new parallel east-west runway, approximately 10,500 feet long by 150 wide. Associated with the runways project are taxiways and navigational aids (NAVAIDS) for runways, property acquisition, Tier 3 Concourse development, relocation of National Oceanographic and Atmospheric Administration (NOAA)/National Weather Service (NWS) Sterling facilities and extension of the APM.

9.1.3 IDENTIFY POTENTIAL EFFECTS

The final steps in the secondary and cumulative effects analysis process involve the determination of effects the potential sources have on the identified resources.

For the assessment of cumulative effects, the projects identified in Table 9.1-2 were evaluated relative to the same social, environmental, economic, and transportation criteria presented in the Final EIS, though at a lower level of detail. The mitigated condition for the evaluated projects was assumed for the analysis. The anticipated effects of these projects were combined with identified impacts of the Dulles Corridor Rapid Transit Project to determine the potential for cumulative effects.

The results of these effects analyses are presented in Sections 9.3 and 9.4.

9.2 RESOURCE IDENTIFICATION

The following resources were identified as sensitive to secondary and cumulative effects:

- Neighborhoods, Community Services and Cohesion;
- Acquisitions and Displacements;
- Visual and Aesthetic Conditions;
- Cultural Resources;
- Parks and Recreation Resources;
- Geologic Resources;
- Water Resources;
- Aquatic Biota and Habitat;
- Terrestrial Biota and Habitat;
- Rare, Threatened and Endangered Species; and
- Traffic and Air Quality Impacts.

If a proposed project does not result in an impact to a certain resource, it would not contribute cumulative impacts to that resource.

9.3 SECONDARY DEVELOPMENT EFFECTS

This section addresses long-term secondary effects of the No Build Alternative, the Wiehle Avenue Extension and the full LPA. Secondary development effects are impacts related to the increased density of development that would occur. The characteristics of the secondary development generated at station areas under the No Build Alternative, the Wiehle Avenue Extension and the full LPA are described further in Chapter 5 of this document. As noted earlier, the provision of transit within the corridor does not, in and of itself, cause secondary development to occur. However, because local jurisdictions have plans in place that allow for greater density to occur in some areas if transit is provided, it is considered induced or secondary development for the purposes of this analysis. In order to address all potential for secondary effects, density bonuses at station areas are included; however, it is important to note that the allowed density bonuses may or may not occur. Discussion of the related effects is presented to disclose, to the extent possible, all potential effects.

Future land development would be greatly influenced by factors outside of the control of the project sponsor. Such factors as the economy, changes in land use plans by the local jurisdictions, and technological trends can all affect how, when, and to what degree land is developed. The growth projections can be considered to be predictive based on current information and similar land use development patterns in the corridor. Actual growth may be more or less than that projected as part of this analysis.

After estimating the potential growth, the impacts of this growth were analyzed in much the same way that the direct impacts of the project were analyzed. Study areas were defined around each proposed station location for the Wiehle Avenue Extension and the full LPA. The size of these study areas varied depending upon where density bonuses were allowed by the local jurisdictions: 1,600 feet radius for the Tysons Corner area, one-half mile radius for Fairfax County (but not within the Town of Herndon where there are no density bonuses at this time), and one-half mile radius for Loudoun County. No assessment of secondary development impacts was undertaken for the Dulles Airport station area because no density bonuses are allowed in this area. Outside of station areas and along regional transportation facilities, the expected effects of secondary development were assessed qualitatively.

The effects on other sensitive resources were evaluated qualitatively, because only general information is known regarding the location, scale, and appearance of the projected development. For example, it is difficult to conduct an in-depth analysis of visual effects associated with new development when specific designs and plans are not available. However, knowing the anticipated density and scale of development, and the relatively confined area in which it is allowed, a general assessment of its visual effects could be conducted. The same methodology applies to other resources as well.

9.3.1 LONG-TERM EFFECTS

This section describes the long-term secondary development effects of the No Build Alternative, the Wiehle Avenue Extension, and the full LPA. The primary source of potential secondary effects would be the increased development allowed at the station areas under the Wiehle Avenue Extension and the full LPA. Although transit does not directly cause development to occur, it does help direct development where infrastructure can better support it. County comprehensive plans have been modified to ensure that new development would be located in the vicinity of stations if a new transit line were built.

A comparison of the alternatives in terms of station area population, employment and development, is shown in Table 9.3-1. The No Build Alternative shows the predicted development characteristics if the LPA was not implemented. It should be noted that the predicted character of development is highly speculative. It represents how development would occur under circumstances similar to today—policies that are applicable today, growth rates based on what is known today, and market influences that are in force today—although it is very unlikely that all of these conditions would continue unchanged until 2025. Therefore, the predicted growth presented in this analysis is useful mostly for comparative purposes and should not be considered as the actual future population, employment, and land use that would occur in 2025.

9.3.1.1 No Build Alternative

Under the No Build Alternative, the density bonuses at the station areas would not be triggered and current development patterns would continue. Development would be driven by market conditions

throughout the corridor and would not be focused in certain areas as it would under the Wiehle Avenue Extension or the full LPA. Undeveloped lands, including natural lands and farmlands in the corridor, would continue to be developed based on market demands. Under the No Build Alternative, traffic congestion on local roads and regional highways would continue to worsen.

Table 9.3-1: Secondary Development Effects

Projections	No Build Alternative (2025)	Locally Preferred Alternative[1]		
		Wiehle Avenue Extension (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Station Area Population Projections	15,500	Not Applicable	90% Increase (Station Areas Only)	233% Increase (Station Areas Only)
Station Area Employment Projections	130,500	Not Applicable	17% Increase (Station Areas Only)	48% Increase (Station Areas Only)
Station Area Residential Development (square feet)	8.7 million	Not Applicable	80% Increase (Station Areas Only)	201% Increase (Station Areas Only)
Station Area Commercial Development (square feet)	42.8 million	Not Applicable	17% Increase (Station Areas Only)	35% Increase (Station Areas Only)

1. Projections are based on information for 2025 only. Opening year forecasts were not prepared due to the longer period of time required for development to take effect following the opening of the LPA.

Commercial includes office, retail, hotel, industrial, and institutional.

Station Area totals include 1,600 foot radii from each station in Tysons and half-mile in remainder of corridor.

9.3.1.2 Wiehle Avenue Extension

For the Wiehle Avenue Extension, the primary source of potential secondary effects is the increased commercial and residential development generated by density bonuses that would occur near planned Metrorail stations. This would result in secondary effects on population, employment, community facilities and services, land development patterns, water resources and traffic. To a lesser extent, the visual character of the area would be affected.

Secondary development would result in a potential increase in population and employment near station areas. This increase in population and employment would in turn create an additional strain on community facilities and services within the study area for the Wiehle Avenue Extension. However, under the No Build Alternative, population and employment is projected to increase within the area and would also cause a strain on these facilities and services.

The allowable transit-related growth would result in an increase in development in the immediate vicinity of stations throughout the corridor, but does not represent a dramatic increase in the overall level of growth allowed in Fairfax and Loudoun counties, as defined in their land use regulations. Rather, the comprehensive plans refocus the previously anticipated levels of growth into patterns that will increase the number of viable travel options available to corridor residents and employees, including transit, walking, and bicycling. As an additional benefit, compact development reduces the cost of providing utilities, facilities, and services to new residential and commercial developments. Comparatively, the No Build Alternative would likely lead to a dispersed pattern of development and would be highly auto-oriented, leaving people with few travel choices and resulting in widespread congestion.

The increase in development near station areas would likely result in greater areas of impervious surfaces. However, due to the existing level of development within the area and the lack of undeveloped, pervious surfaces, the increase would likely be minimal compared to the No Build Alternative.

Analysis of travel effects related to secondary development is primarily focused on station area travel patterns in relation to ridership, transit mode share, pedestrian and bicycle trips, total person and vehicle trips, vehicle miles traveled, and traffic volumes at selected intersections. Travel effects related to secondary development would include increases in peak-period traffic levels, transit mode shares, and pedestrian and bike trips to stations and also support of the reverse commute market through the increase of employment densities near stations. While it is expected that increased density would result in localized traffic congestion in station areas, the new, transit-oriented urban form related to the Wiehle Avenue Extension would help to increase overall mobility in the corridor, the counties, and the region.

Under the Wiehle Avenue Extension, changes in visual character due to denser, transit-oriented development would occur in Tysons Corner and at the Wiehle Avenue Station area. Changes in visual character due to denser development would not be significant in the western part of Fairfax County and Loudoun County, as current development patterns and trends would continue.

9.3.1.3 Full LPA

Secondary effects of the full LPA would be similar to those described for the Wiehle Avenue Extension, albeit to a greater extent due to the less developed character of the western portions of Fairfax County and Loudoun County within the study area.

As with the Wiehle Avenue Extension, the increases in population and employment would result in additional strain on the existing infrastructure, community facilities and services. However, the benefit of compact development reduces the cost of providing utilities, facilities and services to new residential and commercial developments.

The total increase in development projected under the full LPA would be less than the total build-out permitted by the Fairfax and Loudoun county comprehensive plans in the absence of transit. In the Reston and Herndon area, the full LPA could support an increase in development of about 49 million square feet of development by 2025, while total allowable build-out for transit-related growth in this area is approximately 70 million square feet. The compact, high-density form of development would promote mobility much more effectively than sprawled development.

Secondary development would contribute to increased areas of impervious surface and reductions in potential terrestrial and to a lesser extent, aquatic habitat. Unlike the Wiehle Avenue Extension where the majority of the study area is primarily urbanized, the western portion of the study area is more suburban and rural in nature. However, the increase in impervious surfaces and minor loss of undeveloped, rural land would not be substantially greater than that which would occur as projected under the No Build Alternative.

Analysis of travel effects related to secondary development primarily focused on station area travel patterns in relation to ridership, transit mode share, pedestrian and bicycle trips, total person and vehicle trips, vehicle miles traveled, and traffic volumes at selected intersections. While it is expected that increased density will result in localized traffic congestion in station areas, the new, transit-oriented urban form related to the full LPA would help to increase overall mobility in the corridor, the counties, and the region to a greater extent than the Wiehle Avenue Extension.

Changes in visual character would be noticeable in the western portion of the study area due to the existing rural and suburban characteristics. However, current development patterns and trends in this area that are altering the visual setting will continue with or without transit investment.

9.4 CUMULATIVE EFFECTS

Determining the cumulative environmental consequences of an action requires delineating the cause-and-effect relationships between the multiple actions and the resources, ecosystems, and human communities of concern. The analysis of cumulative impacts addresses the "mitigated condition" for both the Dulles Corridor Rapid Transit Project and the other projects included in the analysis.

In determining the cause-and-effect relationships between the multiple actions and the resources, ecosystems, and human communities of concern, the projects listed in Table 9.1-2 were reviewed in conjunction with the social, environmental, economic, and transportation effects detailed in the Final EIS. If the proposed project and the other projects added together would result in an impact that would be considered substantial as a direct impact, then a substantial cumulative impact would occur. At this point, the proposed project level of contribution to the cumulative impact must be considered and mitigation, if available, must be identified appropriate to that contribution.

9.4.1 LONG-TERM EFFECTS

This section describes the cumulative effects of the No Build Alternative, Proposed Action and relevant, reasonably foreseeable actions that could contribute to cumulative effects on four resources: water resources, air quality, historic resources and Section 4(f) resources.

One reasonably foreseeable action within the Dulles Corridor study limits with the potential to influence the analysis of cumulative effects is the program of improvements of Washington Dulles International Airport. The FAA, in association with MWAA, is exploring ways that Dulles Airport can meet the projected demands for air transportation. In order to enable the airport to safely and efficiently meet the forecasted levels of aviation activity, MWAA is proposing to implement airside and landside improvements to Dulles Airport that are part of the 2003 Airport Layout Plan. MWAA is implementing or planning the following improvements: Tier 2 concourse improvements, airside automatic people mover (APM), on-airport roadway improvements, runway reconstruction, new control tower, and two new runways with associated projects. The runways project features a new parallel north-south runway, approximately 9,473 feet long by 150 feet wide and a new parallel east-west runway, approximately 10,500 feet long by 150 feet wide. Associated with the runways project are taxiways and navigational aids (NAVAIDS) for the runways, property acquisition, Tier 3 Concourse development, relocation of National Oceanographic and Atmospheric Administration (NOAA)/National Weather Service (NWS) Sterling Facilities and extension of the APM. With the exception of the Dulles Runways and Associated Projects, which is still under environmental review, the following projects have received Findings of No Significant Impacts (FONSI): Dulles Concourse and Related Projects Environmental Assessment, completed August 2002; Dulles Air Traffic Control Tower Environmental Assessment; completed May 2003; and the Dulles Construction Service Road – Environmental Assessment – Finding of No Significant Impact, completed August 2003. These three projects are considered as part of the No Build and are not evaluated as part of the cumulative effects analysis presented for the Dulles Corridor Rapid Transit Project.

Coordination with FAA on the runways project has resulted in the identification of four potential resource areas where cumulative effects may be of concern. These resource areas of concern are: water resources, air quality, historic resources and resources protected under Section 4(f). The following is a summary of approximate effects related to the Dulles Airport Runways Project on the four identified resource areas. This summary of potential impacts associated with the Dulles Airport Runways Project is provided as a context for the evaluation of potential cumulative effects associated with the Dulles Corridor Rapid Transit Project.

Water Resources

The Dulles Airport Runways Project would have approximately 170 to 180 acres of wetland impacts, primarily to palustrine emergent and forested wetland types. Between 60,000 and 63,500 linear feet of streams would be impacted. Direct impacts to wetlands and streams would result from activities such as clearing vegetation, altering hydrology, filling wetlands and grading for construction activities. Indirect impacts would potentially result from alterations in hydrology. New development would occur within the 100-year floodplain, resulting in lost floodplain storage volume. Approximately 35 to 40 acres of floodplain would be affected.

Air Quality

Total Operation Emissions for the Dulles Airport Runways Project are below minimum levels and conform to the SIP. Construction-related emissions exceed minimum levels. However, they are accounted for in the SIP.

Historic Resources

The Dulles Airport Runways Project is not expected to result in impacts to historic architectural resources. Fourteen archaeological sites within the APE for the runways project have the potential to be impacted. Further studies and coordination are ongoing to determine potential adverse effects to these resources.

Section 4(f) Resources

The Dulles Airport Runways Project would not result in any use of Section 4(f) resources.

9.4.1.1 No Build Alternative

The No Build Alternative would not result in any project-related cumulative impacts. However, there are projects included in the No Build Alternative that will have direct and indirect effects within the limits of the study area. These projects and potential changes are unrelated to the LPA and would occur with or without the transit investment.

9.4.1.2 Wiehle Avenue Extension

Water Resources

The Wiehle Avenue Extension would not result in major long-term effects to wetlands, streams, floodplains or critical areas as defined in Section 4.2 and therefore would not contribute cumulatively to effects on these resources. For construction related effects and minor long-term effects, mitigation is proposed.

There would be no loss of wetlands as a result of the Wiehle Avenue Extension. The alignment crosses five streams, none of which would experience long-term effects.

The construction of bridge piers within floodplains would not result in an increase in surface elevations of more than one-foot within the 100-year floodplains identified. There would be no increased risk of on or off-site flooding associated with the project; therefore, the Wiehle Avenue Extension would not contribute cumulatively to effects on 100-year floodplains.

The Wiehle Avenue Extension would not result in the degradation of critical areas associated with water resources; therefore, it would not contribute cumulatively to effects on these areas.

Air Quality

The Dulles Corridor Rapid Transit Project is included in the Constrained Long-Range Plan (CLRP) prepared by the MWCOG Transportation Planning Board. EPA, FHWA, and FTA have concurred with the conformity determination for the CLRP. Therefore, the project conforms to the Virginia SIP. Fairfax and Loudoun counties, including the Dulles Corridor, are in attainment for CO, NO_2, PM10, Pb, and SO_2. The Dulles Corridor is located in an ozone non-attainment area. None of the one-and eight-hour CO concentrations are predicted to exceed the NAAQS at any of the intersections modeled; therefore, no mitigation is proposed. The Wiehle Avenue Extension would not contribute cumulatively to effects on the region's air quality.

Historic Resources

The Wiehle Avenue Extension would have no adverse effects on known archaeological resources or historic architectural resources. The Wiehle Avenue Extension would result in minor impacts related to slight increase in noise (that would not exceed FTA impact criteria) and minor visual impacts to three historic architectural resources. However, construction of the Wiehle Avenue Extension would not affect the characteristics that contribute to these resources' eligibility for the NRHP. The Wiehle Avenue Extension would not contribute cumulatively to effects on historic resources within the study area.

Section 4(f)

Seven Section 4(f) resources were identified within the limits of the Wiehle Avenue Extension. Based on the existing conditions, the Wiehle Avenue Extension operations would not substantially impair the protected activities, features, or attributes to six of these resources. Therefore, no use of these Section 4(f) resources would occur.

However, a potential physical use to one of these resources could result. The Wiehle Avenue Extension has the potential to constitute an additional Section 4(f) use of the Proposed Hunter Mill Historic District. However, the formal boundaries of this potential district have not been determined. Depending on the determination of the boundaries, the Wiehle Avenue Extension could potentially result in a physical use of this resource.

9.4.1.3 Full LPA

The cumulative effects analysis for the full LPA described below takes into consideration the potential effects identified for the Dulles Airport Runways Project. Even with these potential effects, the full LPA is not expected to result in cumulative effects, given the relatively small scale of the potential effects associated with the full LPA.

Water Resources

The full LPA would result in minor construction related and long-term effects to water resources. However, all impacts would be mitigated. A total of 5.2 acres of wetland impact, of which most occurs

with the Route 28 Station and S&I Yard Site 15. Of the 5.2 acres, 3.6 acres is associated with aerial bridge structures that would permanently change the vegetative class from forested wetland to emergent, but would not be a permanent impact per se because the wetlands would remain but rather, reestablish as an emergent wetland. Given the complexity and length of the project, the wetland impacts are relatively minor. Therefore, it is unlikely these wetland impacts would substantially contribute to the loss of wetlands.

In all, the corridor crosses ten streams. The Route 772 Station would result in piping underground 220 linear feet of a tributary to Broad Run and 25 linear feet of another intermittent tributary to Broad Run, for a total of 245 feet. Appropriate mitigation for these impacts is proposed.

The construction of bridge piers within floodplains would not result in an increase in surface elevations of more than one-foot within the 100-year floodplains identified. There would be no increased risk of on or off-site flooding associated with the project; therefore, the full LPA would not contribute cumulatively to effects on 100-year floodplains.

The full LPA would not result in the degradation of critical areas associated with water resources; therefore, it would not contribute cumulatively to effects on these areas.

Air Quality

The Dulles Corridor Rapid Transit Project is included in the Constrained Long-Range Plan (CLRP) prepared by the MWCOG Transportation Planning Board. EPA, FHWA and FTA have concurred with the conformity determination for the CLRP. Therefore, the project conforms to the Virginia SIP. Fairfax and Loudoun counties, including the Dulles Corridor, are in attainment for CO, NO_2, PM10, Pb, and SO_2. The Dulles Corridor is located in an ozone non-attainment area. None of the one- and eight-hour CO concentrations are predicted to exceed the NAAQS at any of the intersections modeled; therefore, no mitigation is proposed. The full LPA would not contribute cumulatively to effects on the region's air quality.

Historic Resources

Seven archaeological resources were identified within the APE for archaeology. None of these resources would be impacted by construction of the LPA. Eight historic architectural resources were identified within the APE for architecture. In all, five of these resources would experience effects from the full LPA.

Four resources that are potentially eligible for listing in the NRHP would experience minor impacts related to slight increases in noise (that would not exceed FTA impact criteria) and minor visual impacts. However, construction of the LPA would not affect the characteristics that contribute to these resources' eligibility for the NRHP.

One resource, the Dulles Airport Historic District, would be adversely affected under Section 106. The addition of a Metrorail alignment within the district has a visual effect on the "peekaboo sequence" which is a contributing element to the district. However, the impacts would be mitigated through design considerations and the implementation of various treatment measures, which include interpretive exhibits, public artwork, photo documentation and/or landscaping to help preserve the airports' unique historic characteristics. It is not likely that the full LPA would contribute cumulatively to effects on historic resources.

Section 4(f)

In addition to the visual effects on the Dulles Airport Historic District, the full LPA would also result in a Section 4(f) physical use of the historic district. The alignment transitions would also result in a section 4(f) physical use of the historic district. The alignment transitions from at-grade to underground and from underground to aerial structure, which requires an easement from the MWAA.

The full LPA has the potential to constitute an additional Section 4(f) use of the Proposed Hunter Mill Historic District. However, the formal boundaries of this potential district have not been determined. Depending on the determination of boundaries, the LPA could potentially result in a physical use of this resource.

Assessment of Cumulative Effects

The Dulles Airport Runways Project and the Dulles Corridor Rapid Transit Project are not related actions; they are independent of one another. The extent of potential impacts resulting from the Dulles Airport Runways Project has the potential to far exceed those impacts identified for the Dulles Corridor Rapid Transit Project. Based on the technical analysis conducted for the Final EIS, the Proposed Action would not result in major impacts to the resources identified and therefore, would not contribute substantially to potential cumulative effects related to other relevant, foreseeable projects, such as the Dulles Airport Runways Project.

9.5 MITIGATION

Secondary and cumulative effects associated with this project are primarily attributable to projects considered part of the No Build Alternative and secondary development at transit station areas.

Direct impacts resulting from the other projects included in the No Build Alternative would be mitigated as a part of their construction. Any secondary or cumulative effects to the built and natural environment resulting from additional station area development would be mitigated through compliance with Fairfax and Loudoun Counties' land use policies and development permitting processes. County regulations allow the localities to cluster future development in locations that are best able to support that development in terms of providing transit, pedestrian, and bicycle access to residents and employees. In the future, the counties may limit development at station areas if necessary to mitigate any associated impacts to the surrounding community.

Mitigation measures specific to the four resource areas identified are described in the relevant Sections of this Final EIS. No additional mitigation measures are proposed.

10 EVALUATION OF ALTERNATIVES CARRIED FORWARD

This chapter presents a comparative evaluation of the alternatives carried forward in this Final Environmental Impact Statement (EIS). The intent of this evaluation is to demonstrate the relative effectiveness of the alternatives in meeting the stated project goals and objectives, and to highlight the key differences between alternatives to facilitate the decision-making process.

The alternative formerly known as "LPA Phase 1" in the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* has been renamed the Wiehle Avenue Extension in this Final EIS and is expected to begin operations in 2011. This change reflects the federal approach to the project's funding under the Federal Transit Administration's New Starts program. It will assure consistency among the environmental, engineering and financial documents during the project's development.

In the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* as well as this Final EIS, the term "full LPA" represents the Wiehle Avenue Extension and the second phase of the Dulles Corridor Rapid Transit Project. This second phase would extend west from Wiehle Avenue to Washington Dulles International Airport and Route 772 and is expected to begin operations in 2015.

The term "LPA", "proposed action", or "selected LPA" refers to both the Wiehle Avenue Extension and the full LPA collectively.

Consistent with FTA's project development process, the New Starts Baseline Alternative is introduced in this chapter. The New Starts Baseline Alternative is required by the FTA for comparison the Wiehle Avenue Extension. The resulting New Starts data is also summarized in this chapter.

Section 10.1 discusses the performance of the No Build Alternative, the Wiehle Avenue Extension and the full LPA relative to the measures of effectiveness that reflect the project goals and objectives.

Section 10.2 summarizes the Wiehle Avenue Extension performance relative to the FTA New Starts Criteria based on a comparison with the New Starts Baseline Alternative. This comparison is required for all projects seeking FTA funding under the New Starts program.

10.1 EVALUATION RELATIVE TO PROJECT GOALS AND OBJECTIVES

This section presents the evaluation of the Wiehle Avenue Extension and the full LPA in comparison to the No Build Alternative. Project goals form the basis of evaluation, which are translated into objectives, which are, in turn, translated into quantifiable measures of effectiveness. In general the measures correspond to the effects documented in Chapters 3 through 9 of the Final EIS. As previously defined, the alternatives are:

No Build Alternative. The No Build Alternative includes all existing highway and transit infrastructure and services within the corridor, and any that are committed to be implemented by 2025, aside from the Dulles Corridor Rapid Transit Project. The No Build Alternative is consistent with the "no-action alternative" required by the Council of Environmental Quality's (CEQ's) regulations for implementing the National Environmental Policy Act of 1969 (NEPA), as amended, and provides a baseline for comparison against the full LPA and the Wiehle Avenue Extension.

The Wiehle Avenue Extension. The Wiehle Avenue Extension is the first 11.6 miles of the full LPA with four stations in Tysons Corner and a fifth interim end-of-line station at Wiehle Avenue. Express Bus Service would be provided between Wiehle Avenue and the western portion of the corridor until the remainder of the full LPA is constructed.

The full LPA. The full LPA is a 23.1 mile extension of Metrorail that generally follows an alignment between the Metrorail Orange Line near the West Falls Church Station and Route 772 in Loudoun County, using the median of the Dulles Connector Road, the DIAAH, and the Dulles Greenway. The alignment diverges from these routes to serve Tysons Corner and Dulles Airport. The LPA would include 11 new stations, as well as ancillary facilities, such as a new Metrorail S&I Yard on Dulles Airport property, traction power substations, tie-breaker stations, and storm water management ponds.

As described in Chapter 1, Table 10.1-1 outlines the goals and objectives for the Dulles Corridor Rapid Transit Project which are intended to reflect the transportation needs of the corridor.

The goals and objectives include the following:

Table 10.1-1: Goals and Objectives

Goals	Objectives
Goal 1 Improve Transportation Service	§ Provide more frequent service for trips to the core of the region, Tysons Corner, Reston/Herndon, Dulles Airport, and eastern Loudoun County. § Provide multi-modal access. § Improve travel times within the corridor and the region. § Provide integrated, seamless transit service to Tysons Corner and other major activity centers. § Provide improved transit service in the corridor in the near term.
Goal 2 Increase Transit Ridership	§ Provide more frequent service for trips to the core of the region, Tysons Corner, Reston/Herndon, Dulles Airport, and eastern Loudoun County. § Provide multi-modal access. § Improve the amenities of the existing transit service within the corridor and the region. § Improve travel times within the corridor and the region. § Provide integrated, seamless transit service to Tysons Corner and other major activity centers. § Provide improved transit service in the corridor in the near term.
Goal 3 Support Future Development	§ Provide improved accessibility to existing and planned activity centers in the corridor and the region. § Provide transit service that supports and is consistent with the character of the existing and future land use and development. § Provide stations that are compatible with the character of the surrounding neighborhoods and encourage transit use.
Goal 4	§ Contribute to the attainment of regional air quality standards.

Goals	Objectives
Support Environmental Quality	§ Minimize negative impacts to traffic patterns. § Minimize negative impacts on neighborhoods and residential land uses. § Minimize negative impacts to ecologically sensitive areas. § Minimize negative impacts to historic and cultural resources. § Minimize negative visual and aesthetic impacts.
Goal 5 Provide Cost-effective, Achievable Transportation Solutions	§ Develop transportation improvements that are consistent with the funding and financial capacity of the region. § Minimize project-operating costs. § Optimize cost-effectiveness.
Goal 6 Serve Diverse Populations	§ Balance benefits and impacts to all residents within the corridor. § Improve accessibility to existing and planned employment centers from low-income and minority areas. § Provide transportation improvements that comply with the Americans with Disabilities Act standards. § Minimize and mitigate negative impacts to low-income and minority populations.

In general, the No Build Alternative would not meet the goal of providing improved transit service in the Dulles Corridor. Moreover, the No Build Alternative would be inconsistent with local and regional comprehensive plans, which specifically identify rapid transit improvements in the Dulles Corridor as a critical element in shaping development in the corridor and meeting regional economic development goals.

The Wiehle Avenue Extension and the full LPA would offer a much better level of transit service than what is included under the No Build Alternative, enhancing mobility for corridor residents and employees, especially during the midday. The full LPA would provide higher transportation and economic development benefits than the proposed the Wiehle Avenue Extension. Only the full LPA would be consistent with future land use designations or future land development patterns west of Wiehle Avenue and provide high-quality, high-capacity transit service to the Dulles International Airport, one of the world's fastest growing airports.

The Wiehle Avenue Extension would have fewer negative effects on environmental resources and communities in the Dulles Corridor than the LPA. In general, the Wiehle Avenue Extension would perform similarly to the full LPA from Wiehle Avenue Station to the existing Metrorail Orange Line. Implementation of Express Bus Service in the western end of the corridor for the Wiehle Avenue Extension would typically have minimal physical effects and fewer transportation and development benefits.

The general consensus among elected officials, public agencies, and the general public, including property owners, community groups, civic associations, and businesses, has been that Metrorail should be ultimately extended for the full length of the Dulles Corridor from the existing Orange Line through Tysons Corner to Route 772 in Loudoun County.

By use of measures of effectiveness, Table 10.1-2 summarizes each alternative relative to the project's goals and objectives for the No Build Alternative, the full LPA, and the Wiehle Avenue Extension.

Table 10.1-2: Measures of Effectiveness

Measures of Effectiveness by Objective		Locally Preferred Alternative		
	No Build Alternative	Wiehle Avenue Extension Opening Year (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Goals 1 and 2: Improve Transit Service and Increase Transit Ridership				
Provide More Frequent Service				
Peak Period Headways (Minutes)	5 – 30	7	7	7
Off Peak Period Headways (Minutes)	30 - 60	12	12	12
Provide Multi-Modal Access				
Access to Park and Ride Facilities	4	5	5	6
Access to New Rail Stations	0	5	5	11
Rail Service to Dulles Airport	0	0	0	1
Improve Travel Times	No	Partial	Partial	Yes
Provide Integrated, Seamless Service	No	Partial – East of Wiehle Ave.	Partial –East of Wiehle Ave.	Yes
Improve the Amenities of the Existing Transit Service	No	Yes – Less than full LPA	Yes – Less than full LPA	Yes
Goal 3: Support Future Development				
Improved Accessibility to Activity Centers	No	Partial	Partial	Yes
Consistent with Existing Land Use	Yes	Yes	Yes	Yes
Consistent with Future Land Use Plan	No	Partial	Partial	Yes
Stations Compatible with Neighborhoods	No Stations	Yes	Yes	Yes
Goal 4: Support Environmental Quality

	No Build Alternative	Wiehle Avenue Extension Opening Year (2011)	Wiehle Avenue Extension (2025)	Full LPA (2025)
Metrorail O&M Cost Per Passenger Mile	$0.41 (2011) $0.55 (2025)	$0.40	$0.52	$0.50
Goal 6: Serve Diverse Populations				
Low-Income and Minority Areas Without Rail Service	6	4	4	0
Compliance with ADA	Yes	Yes	Yes	Yes
Physical Impacts to Low-Income and Minority Areas	None	None	None	None

The remainder of this section describes the effectiveness of the alternatives in satisfying each of the project's goals and objectives.

10.1.1 GOALS 1 AND 2: IMPROVE TRANSPORTATION SERVICE AND INCREASE TRANSIT RIDERSHIP

A. Provide More Frequent Service for Trips to the Core of the Region, Tysons Corner, Reston/Herndon, Dulles Airport, and Eastern Loudoun County

The measures used to evaluate how well the alternatives would provide more frequent service in the study area include peak period and off-peak period headways in minutes. Transit service headways provided in the corridor range between 5 and 30 minutes in the peak period and increase to between 30 and 60 minutes in the off-peak. The Wiehle Avenue Extension and the full LPA provide seven minute headways during the peak hour and 12 minute headways during the off-peak period. The Wiehle Avenue Extension and the full LPA generally provide higher service levels than the No Build Alternative especially in the midday and evening off-peak periods.

B. Provide Multi-Modal Access

The alternatives considered provide direct access to a number of intermodal facilities including park-and-ride, bus transit transfer centers, new rail transit stations, and airports. The full LPA maintains existing bus connections and provides new rail connections to the greatest number of these facilities. The full LPA includes 6 park-and-ride facilities, 11 new rail transit stations, and provides rail service connections to one airport. The Wiehle Avenue Extension serves a fewer number of intermodal centers including five park-and-ride facilities, five new rail transit stations, and connections to one airport. The No Build Alternative provides the fewest intermodal connections serving four park-and-ride facilities, no new rail transit stations, and provides no rail transit service connections to Dulles Airport.

C. Improve Travel Times within the Corridor and the Region

Transit travel times for several trip origin and destination pairs have been estimated for each of the alternatives as documented in Chapter 6. These origin and destination pairs include:

- Tysons Corner and Metro Center
- Tysons Corner and Dulles Airport
- Reston Town Center and Union Station
- Reston Town Center and Tysons Corner
- Reston Town Center and Dulles Airport
- Rosslyn and Dulles Airport
- Herndon-Monroe and Pentagon
- Herndon-Monroe and Tysons Corner

For all of these origin and destination (O/D) pairs, the full LPA provides shorter transit travel times compared to the No Build Alternative, with the exception of the Tysons Corner/Metro Center and Herndon-Monroe/Pentagon pairs. For the Tysons Corner/Metro Center trip the No Build Alternative provides a 37 minute travel time and the LPA provides a 38 minute travel time. For the Herndon-Monroe/Pentagon trip the No Build Alternative provides a 50 minute trip and the LPA provides a 55 minute travel time. All of the other trip origin and destination pairs result in transit travel time savings of between 5 and 53 minutes when the No Build Alternative is compared to the full LPA.

In general, the Wiehle Avenue Extension would offer less travel time savings than the full LPA, but it would still offer an improvement in transit travel times over the No Build Alternative for most O/D pairs. For trips between Wiehle Avenue and points east, the Wiehle Avenue Extension would provide similar travel times to the full LPA, because the Metrorail service would be similar in this portion of corridor. For trips with at least one end west of Wiehle Avenue, the Wiehle Avenue Extension would have greater travel times than the full LPA due to transfer requirements and decreased service frequency in the reverse peak direction. If the LPA is not implemented in its entirety in 2025, the Wiehle Avenue Extension would generally have travel times that are 5 to 10 minutes longer than the full LPA.

D. Provide Integrated, Seamless Transit Service to Tysons Corner and Other Major Activity Centers

The full LPA provides a seamless high capacity premium transit service to the Tysons Corner as well as other key activity centers such as Dulles Airport, Reston Town Center, and Herndon-Monroe. The Wiehle Avenue Extension provides service to Tysons Corner but does not serve the centers west of Wiehle Avenue with seamless service. The No Build Alternative does not provide this seamless, high level service to the activity centers in the corridor.

E. Provide Improved Transit Service in the Corridor in the Near Term

The No Build Alternative does not provide substantially improved transit service in the corridor. Wiehle Avenue Extension provides improved service through a portion of the corridor as early as 2011. The full LPA provides improved transit through the whole corridor but would not be fully complete until 2015.

F. Improve Amenities of the Existing Transit Service

The No Build Alternative does not provide significant additional transit service amenities that would not also be included in the full LPA or the Wiehle Avenue Extension alternatives. However, the Wiehle Avenue Extension and the full LPA offer several passenger amenities at station sites including advanced fare collection, simple transfers between lines, multiple door vehicle boarding from level platforms, park-and-ride lots, and kiss and ride access.

10.1.2 GOAL 3: SUPPORT FUTURE DEVELOPMENT

A. Provide Improved Accessibility to Existing and Planned Activity Centers in the Corridor and the Region

The full LPA provides direct access to the Tysons Corner as well as other key activity centers such as Dulles Airport, Reston Town Center, and Herndon-Monroe. The Wiehle Avenue Extension provides service to the Tysons Corner but does not serve the centers west of Wiehle Avenue. The No Build Alternative generally does not provide improved access to the activity centers in the corridor.

B. Provide Transit Service that Supports and is Consistent with the Character of the Existing and Future Land Use and Development

All of the alternatives provide bus and rail transit services that are consistent with the existing land uses in the corridor. However, the No Build Alternative would be inconsistent with local comprehensive plans and regional transportation plans, which specifically identify rapid transit improvements in the Dulles Corridor as a critical element in shaping development in the corridor and meeting regional economic development goals. Only the full LPA would be consistent with future land use designations or future land development patterns west of Wiehle Avenue and provide high-quality, high-capacity transit service to Dulles International Airport.

C. Provide Stations that are Compatible with the Character of the Surrounding Neighborhoods and Encourage Transit Use

Because both the Wiehle Avenue Extension and the full LPA would be constructed primarily within existing transportation rights-of-way, direct land use conversions and conflicts with surrounding land uses would be minimal. The extension of Metrorail within existing transportation corridors would be consistent with existing and future land uses. This is also consistent with existing zoning along the proposed alignment, except in some stations where special exceptions may be required for the construction of station facilities. To encourage transit use, station facilities typically include entrance pavilions, mezzanines, platforms, parking facilities, bus bays, kiss-and-ride areas, and park-and-ride lots.

10.1.3 GOAL 4: SUPPORT ENVIRONMENTAL QUALITY

A. Contribute to the Attainment of Regional Air Quality Standards

All the alternatives offer some reduction in vehicle emissions compared to the existing condition. However, the Wiehle Avenue Extension and the full LPA provide substantial reductions in regional Vehicle Miles Traveled (VMT) when compared to the No Build Alternative. VMT is a major indicator of the amount of total vehicle emissions that result from each of the alternatives. The full LPA results in the largest reduction of VMT, about 401.7 million miles per year in 2025. The Wiehle Avenue Extension results in a reduction of about 251.6 million miles per year in 2011 (opening year) and 153.8 million miles per year in 2025. None of the alternatives would result in NAAQS violations.

B. Minimize Negative Impacts to Traffic Patterns

The impact of each of the alternatives on traffic patterns measured in terms of intersection levels of service in the p.m. peak hour have been estimated. Intersection levels of service are used to characterize traffic operations for roadway segments and intersections. Levels of Service (LOS) range from A to F, with A representing no congestion or delay and F representing failure and extreme congestion and delay. Levels of service for major intersections in the immediate vicinity

of each of the stations for the Wiehle Avenue Extension and the full LPA have been estimated based on future traffic conditions. In the Wiehle Avenue Extension station areas, three intersections would operate at LOS F during the p.m. peak hour in 2011, and six for the Wiehle Avenue Extension in 2025. For the full LPA station areas, 16 intersections would operate at LOS F in the p.m. peak period in 2025.

C. Minimize Negative Impacts on Neighborhoods and Residential Land Uses

The No Build Alternative has no significant negative impacts on neighborhoods with regard to residential displacements, partial acquisitions of residential properties, community cohesion, or community facility impacts. Located primarily in existing transportation right-of-way, the Wiehle Avenue Extension and the full LPA also include no residential displacements or negative effects on community cohesion. However, the Wiehle Avenue Extension and the full LPA both include the partial acquisition of 11 residential properties.

D. Minimize Negative Impacts to Ecologically Sensitive Areas

Both the No Build Alternative and the Wiehle Avenue Extension have no significant negative impacts to ecologically sensitive areas such as wetlands, streams, or prime upland systems. The full LPA has no impacts to prime upland systems but has the potential to impact 5.2 acres of wetlands and 245 linear feet of streams along its alignment from Wiehle Avenue to Route 772.

E. Minimize Negative Impacts to Historic and Cultural Resources

The full LPA Alternative could potentially impact one historic/cultural resource site at Dulles Airport. No potential impacts to historic and cultural resources have been identified for the No Build or the Wiehle Avenue Extension Alternatives.

F. Minimize Negative Visual and Aesthetic Impacts

The No Build Alternative has no significant negative visual or aesthetic impacts. Both the Wiehle Avenue Extension and the full LPA would introduce new visual elements, such as Metrorail stations, pedestrian walkways, parking structures, tie-breaker stations and traction power substations, into the existing visual setting of the study area. However, due to the existing land uses and existing visual and aesthetic characteristics of the area, overall the proposed improvements and associated facilities would have a less than substantial effect on sensitive resources and viewers.

10.1.4 GOAL 5: PROVIDE COST-EFFECTIVE, ACHIEVABLE TRANSPORTATION SOLUTIONS

A. Develop Transportation Improvements that are Consistent with the Funding and Financial Capacity of the Region

The No Build Alternative minimizes the potential capital costs of the system. The Wiehle Avenue Extension has an estimated capital cost of approximately $1.5 billion in YOE dollars. The full LPA is the highest cost alternative with capital costs of approximately $3.5 billion in YOE dollars. It is assumed that approximately 50 percent of these costs would be funded from state and local sources.

B. Minimize Project Operating Costs

The No Build Alternative minimizes the potential incremental operating costs of the system. The Wiehle Avenue Extension includes an estimated incremental operating cost of $47.47 million per

year in 2011 that rises to $67.64 million per year by 2025. The full LPA is the highest cost alternative with incremental operating costs of $117.88 per year by 2025.

C. Optimize Cost-Effectiveness

Estimates of the operating and maintenance cost per revenue mile of service, operating and maintenance cost per new trip, and operating cost per passenger mile have been identified as measures of cost effectiveness. The estimated Metrorail operating and maintenance cost per revenue mile with the Wiehle Avenue Extension in the opening Year 2011 is approximately $8.94 per revenue mile. When Year 2025 revenue miles are considered the value is about $11.81 per revenue mile. The full LPA in Year 2025 results in a values of $11.69 per revenue mile. The estimated operating cost per new trip for Metrorail is lowest for the Wiehle Avenue Extension in 2011, with a value of $5.55. This increases to $6.68 for the Wiehle Avenue Extension in 2025. The full LPA in 2025 has the highest value of $8.39 per new trip. The Metrorail operating costs are approximately $0.40 per passenger mile of service for the Wiehle Avenue Extension in 2011 and about $0.52 and $0.50 per passenger mile for the Wiehle Avenue Extension and the full LPA in the Year 2025, respectively.

10.1.5 GOAL 6: SERVE DIVERSE POPULATIONS

A. Balance Benefits and Impacts to all Residents within the Corridor

None of the alternatives include physical impacts to low income or minority neighborhoods identified in the corridor. The Wiehle Avenue Extension would serve only one of the low income or minority neighborhoods with Metrorail service, leaving five low income or minority neighborhoods without Metrorail service. The full LPA would provide Metrorail service to all six of the identified low income and minority neighborhoods.

B. Improve Accessibility to Existing and Planned Employment Centers from Low-Income and Minority Areas

The No Build Alternative does not provide increased accessibility to any of the six low income and minority areas. The Wiehle Avenue Extension would serve one low income and minority neighborhood with Metrorail service and four additional low income and minority neighborhoods would receive improved access via new Express Bus Services connecting to the Wiehle Avenue Metro station. The full LPA would have direct Metrorail access to all six low income and minority neighborhoods. Those neighborhoods that do have access to the Metrorail system or new Express Bus Services would have improved transit connections to employment centers in the Tysons Corner area and other activity centers served by the Washington Metrorail system.

C. Provide Transportation Improvements that Comply with the Americans with Disabilities Act Standards

All alternatives include services that are in compliance with the Americans with Disabilities Act.

D. Minimize and Mitigate Negative Impacts to Low-Income and Minority Populations

None of the alternatives include physical impacts to low income or minority neighborhoods identified in the corridor.

10.2 NEW STARTS CRITERIA

This section describes the New Starts Criteria and associated evaluation measures the FTA uses to evaluate and rate fixed guideway transit projects seeking federal funding for implementation.

The New Starts program is the Federal government's primary financial resource for supporting locally-planned, implemented, and operated transit "guideway" capital investments.

Each year FTA prepares its Annual Report on New Starts for Congress as a companion document to the annual budget submitted by the President. The report documents recommendations for the allocation of funds under Section 5309 of Title 49 of the United States Code. The Transportation Efficiency Act for the 21st Century (TEA-21) requires that the annual report include the evaluation and ratings of new or extended fixed-guideway transit projects. The FTA reviews the criteria results for each candidate project and assigns a rating for each criterion. Based on criteria ratings, a candidate project receives an overall rating of either highly recommended, recommended, or not recommended.

Project sponsors are asked to provide the results on specific project measures that respond to each of the criteria. The August 2004 submittal was based on the Wiehle Avenue Extension . The measures are derived by comparing the estimated results of the Wiehle Avenue Extension to those of a Baseline Alternative. The Baseline Alternative represents a lower cost alternative with comparable service to the LPA (Build) alternative. The Baseline Alternative for this project consists of expanded Fairfax, WMATA Metrobus, and Loudoun bus services in the corridor, with service focused on new express bus service along the Dulles Access/Toll Road. The new Express Bus Service would connect the same major destinations that are served by the Wiehle Avenue Extension .

The criteria measures are described as follows:

A. Project Justification

Mobility Improvements - The estimated transit system user benefits for the candidate project compared to the Baseline Alternative expressed in terms of minutes saved per passenger mile. This criterion also considers the number of low income households within ½ mile of station sites.

Environmental Benefits - This criterion considers the potential impact on pollutants and annual energy savings for the project in comparison to the Baseline Alternative. Pollutants include Carbon Monoxide (CO), Nitrogen Oxide (NOx), Volatile Organic Compounds (VOCs), Hydrocarbons (HC), Particulate Matter (PM10), and Carbon Dioxide (CO_2).

Operating Efficiencies - This criterion includes the estimated system operating cost per passenger mile.

Cost Effectiveness - This criterion includes the estimated incremental cost per system user benefit (hour of travel time savings)

Transit-Supportive Land Use and Future Patterns - This criterion is measured based on a qualitative assessment of the project's ability to address several land use related issues including existing land use compatibility, containment of sprawl, transit supportive corridor policies, supportive zoning regulations near stations, tools to implement land use policies, and performance of land use policies.

B. Local Financial Commitment

Stability and Reliability of Capital Financing Plan - The project financial plan is reviewed including an assessment of the local financial commitment to fund the capital needs of the project.

Stability and Reliability of Operating Finance Plan - The project financial plan is reviewed including an assessment of the local financial commitment to fund the operating needs of the project.

Table 10.2-1 summarizes the quantitative measures submitted for the Wiehle Avenue Extension in August 2004.

Table 10.2-1: Summary of New Starts Quantitative Measures for the Wiehle Avenue Extension

Criteria	Measure	Results
Mobility Improvements	Total Transit System User Benefits Per Passenger Mile (in minutes)	1.89
	Number of Low Income Households within ½ Mile of Stations	170
	Number of Total Jobs within ½ Mile of Stations	100,980
Environmental Benefits	Change in Carbon Monoxide Emitted (tons per year)	-160.87
	Change in Nitrogen Oxides Emitted (tons per year)	-31.01
	Change in Volatile Organic Compounds Emitted (tons per year)	-13.98
	Change in Particulate Matter Emitted (tons per year)	-10.68
	Change in Carbon Dioxide emitted (millions of tons per year)	-5,521.07
	Energy (millions of BTUs per year)	-9,329.02
Operating Efficiencies	Incremental System Operating Cost Per Passenger Mile	$0.005
Cost Effectiveness	Cost per Hour of User Benefits	$21.08
	Cost per New Trip	$24.73
Land Use (Year 2025)	Total Housing Units in Station Areas	6,943
	Total Population in Corridor	155,179
	Total Employment in Corridor	226,504
	Corridor Population as a % of Metropolitan Area	2.6%
	Corridor Employment as a % of Metropolitan Area	5.6%
	Population Density in Corridor (per square mile)	3,535
	Employment Density in Corridor (per square mile)	5,159
Financial Plan Information	Total Capital Cost (YOE $)	$1,521,500,000
	Proposed Federal Section 5309 New Starts Share of Capital Costs (YOE $)	$760,700,000
	Proposed State Sources for Capital Funding (YOE $)	$380,400,000
	Proposed Local Sources for Capital Funding (YOE $)	$380,400,000
	Estimated Annual Incremental Operating Costs - 2025 (millions of YOE$)	$67.6

11 PUBLIC COORDINATION AND COMMENTS

This chapter presents the public involvement and agency coordination activities for the Dulles Corridor Rapid Transit Project. It also presents an overview of the comments and responses received from the public and agencies throughout the duration of the project.

Section 11.1 describes the public involvement program and outreach techniques undertaken throughout the duration of the project and future public outreach efforts.

Section 11.2 summarizes the extensive agency coordination efforts undertaken with federal, state and local resource agencies.

Section 11.3 presents an overview of the comments and responses received from the public and resource agencies for the Dulles Corridor Rapid Transit Project.

The development and selection of the Locally Preferred Alternative (LPA) for the Dulles Corridor Rapid Transit Project was based upon extensive coordination with the public and federal, state and local agencies. This chapter presents the public involvement and agency coordination activities and findings that supported decision-making during project development and review under the National Environmental Policy Act of 1969 (NEPA), as amended. Insights and recommendations received from the public and agencies over the course of the NEPA process influenced the design and implementation of the project to reduce potential environmental consequences, including the development of mitigation measures to offset short-term construction and long-term operational impacts associated with the LPA. Coordination with the public and federal, state, and local agencies was ongoing throughout the project development process. Public and agency comments were formally solicited and documented during project scoping between July 2000 and September 2000 and following the public circulation of two major NEPA documents: the June 2002 *Dulles Corridor Rapid Transit Project Draft Environmental Impact Statement and Section 4(f) Evaluation* (Draft EIS) and the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* (Supplemental Draft EIS).

As part of the public review period for these documents, public hearings were held on the Draft EIS in July of 2002, and on the Supplemental Draft EIS in December 2003. Following the close of the formal NEPA review periods, the public and agencies were provided additional opportunities to comment during post-hearing coordination activities conducted by the Virginia Department of Rail and Public Transportation (DRPT) and the Washington Metropolitan Area Transit Authority (WMATA). These activities included the public circulation of public hearing reports prepared to summarize comments and responses, and convening of post-hearing conferences to address potential refinements to project design and implementation. Through this process, this Final EIS has incorporated information and project refinements needed to address comments received on the project during the public review of the Draft EIS and the Supplemental Draft EIS.

Comments made during this process, as well as responses to the comments, are included in this Final EIS as Appendix J (Public and Agency Comments and Responses).

Copies of correspondence received from federal, state, regional, and local agencies are included as Appendix K (Agency Correspondence).

The alternative formerly known as "LPA Phase 1" in the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* has been renamed the Wiehle Avenue Extension in this Final EIS and is expected to begin operations in 2011. This change reflects the federal approach to the project's funding under the Federal Transit Administration's New Starts program. It will assure consistency among the environmental, engineering and financial documents during the project's development.

In the October 2003 *Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation* as well as this Final EIS, the term "full LPA" represents the Wiehle Avenue Extension and the second phase of the Dulles Corridor Rapid Transit Project. This second phase would extend west from Wiehle Avenue to Washington Dulles International Airport and Route 772 and is expected to begin operations in 2015.

The term "LPA", "proposed action", or "selected LPA" refers to both the Wiehle Avenue Extension and the full LPA collectively.

11.1 PUBLIC INVOLVEMENT

During the preparation of the Draft EIS and the Supplemental Draft EIS, a comprehensive public involvement program was conducted to provide citizens with an interest in the Dulles Corridor Rapid Transit Project the opportunity to keep informed of project developments, to participate in project planning and to provide their insights to decision-makers for the selection of the LPA. In order to facilitate public participation in project planning and design, several different outreach techniques were employed to reach a wide range of participants. These included a variety of information dissemination outlets and interactive techniques, in addition to meetings and coordination and public hearings as described below.

11.1.1 PUBLIC OUTREACH ACTIVITIES AND INFORMATION EXCHANGE

A number of different techniques and activities were conducted over the course of the environmental review process in order to ensure that the public remained informed of project developments and were provided the opportunity to comment throughout project planning and design. Major activities conducted for the project included a call-in line, mailing list, newsletter, update bulletins, comment forms, website, and email address, as well as the distribution of project materials through the project kiosk and information center, libraries and community centers. Other outreach techniques included representation at community fairs and festivals, and presentations to communities and businesses.

Project INFO Line (1-888-566-7245). The project INFO line, a toll-free, 24-hour telephone number, was established to provide project information to interested individuals and answer their questions, as well as to receive their comments. A telephone number was also established incorporating Telecommunications Device for the Deaf (TDD) technology for callers requiring such special assistance (202-638-3780).

Project Mailing List. A project mailing list was maintained and used to distribute newsletters, updates, meeting notices, and other project materials. The project mailing list will be maintained for all future public outreach efforts.

Project Newsletters. Newsletters have been produced and distributed at project milestones throughout the environmental review and project development process to update the public and to obtain public comment. Since May 2001, newsletters have included a news item in Spanish to announce that additional Spanish language project information is available through the Project INFO line. Project newsletters will be part of continuing public outreach efforts.

Project Updates. Project updates were published between newsletters beginning in August 2000. These brief bulletins discussed the latest project developments and future public participation opportunities. Continuing public outreach efforts will include project updates posted on the project website.

Comment Forms. Comment forms were made available in project newsletters, at public meetings, and at other project venues. The forms could be returned at drop-off boxes at meetings or hearings or placed in the mail (they included pre-paid postage).

Project Website (www.dullestransit.com). The project website was updated on an on-going basis to provide information about the project including a project overview, schedule, description of the preliminary engineering and NEPA process, alternatives under consideration, public involvement opportunities, publications, maps, photographs, frequently asked questions, and other transit-related materials. The website also offered a link to contact the project team directly through the project e-mail address (dullescorridor@aol.com) for those wishing to make a comment. The project website will be maintained through preliminary engineering.

Project E-mail Address (dullescorridor@aol.com). This address was included on all publicly distributed project materials, and offered a convenient way for the public to provide comments, ask questions, request additional information on the project, and link to the project website.

Project Kiosk. Located at a regional shopping mall in the midst of a major employment center, the Tysons Corner Center Kiosk was operated from October 2000 until July 2003 during normal mall hours, (Monday through Saturday from 10 a.m. to 9:30 p.m. and on Sunday from 11 a.m. to 6 p.m.) seven days a week. The kiosk provided the opportunity for citizens to participate in the project by reviewing project materials, speaking with project staff members, using the project website, signing up for project mailings, and making comments on the project.

Project Information Center. A project information center operated in 2001 at the Spectrum at Reston Center. The information center provided the opportunity for citizens to participate in the project by reviewing project materials, speaking with project staff members, using the project website, signing up for project mailings, and making comments on the project.

Libraries and Community Center Outreach. More than 20 libraries and community centers within the Dulles Corridor displayed project materials such as project newsletters, updates, and reports that could be examined during normal hours of operation.

Representation at Community Fairs and Festivals. The public had the opportunity to learn about and comment on the project and sign up for the project mailing list at special community events where project information was displayed:

- § Fall for Fairfax Festival at the Fairfax County Government Center on October 7, 2000;
- § Reston Community Connections event at the Reston Town Center on October 12, 2000;
- § Fall Family Fun Fest in McLean on October 14, 2000;
- § McLean Day at Lewinsville Park on May 19, 2001; and
- § Celebrate Fairfax 2001 at the Fairfax County Government Center on June 8-10, 2001.
- § Fall for Fairfax, September 29, 2001.

Community Presentations and Business Briefings. Project team members have conducted over 250 briefings and presentations with organized groups including communities and associations, as well as area businesses. The presentations were given upon request, and have been useful to inform the groups about the project and provided a forum for questions and comments related to the specific areas of interest. Community presentations and business briefings will be included in continuing outreach efforts.

11.1.2 PUBLIC COORDINATION MEETINGS AND PUBLIC HEARINGS

As required by Federal Transit Laws 49 USC §5323(b) and §5324(b) public coordination meetings and public hearings were held. Notices of public hearings were also provided. Meetings were held with the general public and stakeholders on an as-needed basis to understand the issues of concern to area residents and stakeholders, as well as to inform the development and evaluation of potential alternatives and the selection of the LPA. Public meetings held to support the development of the project included public scoping meetings, public information meetings, stakeholder meetings, and public hearings on the Draft EIS and the Supplemental Draft EIS, as well as post-hearing conferences.

11.1.2.1 Public Scoping Meetings

Scoping is the process by which the range of alternatives and issues for study during the environmental review process are identified. During the scoping process, a series of public scoping meetings were conducted on July 25, 26, and 27, 2000 to provide the public with an overview of the project and an opportunity to comment. Public notification of the scoping meetings was provided through TV, radio, and print communication outlets, and included the following:

- § Public Scoping Information Packets, including invitations to public scoping meetings, mailed to 4,725 invitees;
- § Meeting announcements sent to local libraries, community centers, and transportation management associations;
- § Cable television notices provided to three local cable networks;
- § News releases distributed to more than 50 print and broadcast media outlets in the region;
- § Newspaper advertisements placed in 13 local newspapers;
- § Notices on the DRPT and WMATA websites; and,
- § A project INFO line was established and a recorded message broadcasted the dates, times, and locations of the public and agency meetings; and

In all, more than 400 members of the public attended the three scoping meetings.

During the July 25, 2000 meeting at George C. Marshall High School in Falls Church, 203 members of the public attended and 29 members of the public spoke. Comments at this meeting were generally related to:

- Support for mass transit in the corridor;
- Parking;
- Pedestrian access;
- Land use and development close to the proposed station locations;
- Station locations and alignment alternatives; and
- Impacts (e.g., noise levels, pollution, property values, congestion, and crime).

During the scoping meeting held on July 26, 2000 at Langston Hughes Middle School in Reston, 149 members of the public attended and 19 members of the public spoke. Comments at this meeting were generally related to:

- Support for the project and the extension of Metrorail service;
- Project schedule;
- Transit-friendly and mixed-use development;
- Increased density near proposed station locations;
- Impacts on the community (e.g., air quality);
- Pedestrian access and provisions for people with disabilities;
- Transferring between Metrorail and bus/Bus Rapid Transit (BRT) service;
- Increased frequency of service and extended hours of operations for service to Dulles Airport;
- An integrated transportation system in Northern Virginia (including feeder bus service); and
- Costs and/or funding.

During the scoping meeting held on July 27, 2000 at Ashburn Elementary School in Ashburn, 61 members of the public attended, and 12 members of the public spoke. Comments at this meeting were generally related to:

- Support for the project;
- Project schedule and implementation;
- Alternatives under consideration;
- Transit that would serve commuters from western Fairfax County and Loudoun County;
- Land use planning and density near proposed station locations and parking facilities;
- Sprawl;
- Capacity of the Metrorail system;
- Cost and funding (including the impacts associated with the BRT national demonstration project);
- Purpose of an Environmental Impact Statement (as opposed to moving forward with an Environmental Assessment); and
- An integrated transit system in Northern Virginia.

In addition to the public testimony received at the scoping meetings, a total of 210 comment forms were received. These comments, combined with the verbal testimony, were used to identify and refine the alternatives considered during development of the Draft EIS. Appendix J includes a more detailed summary of all public comments, including those made at the scoping meetings. Comments received from federal, state, and local agencies during the scoping process are included in Appendix K. The results of the public coordination during the scoping process were documented in the September 2000 *Scoping Process Report.*

11.1.2.2 Public Information Meetings and Stakeholder Meetings

These meetings were held to provide updates on the development of alternatives under consideration for the project, to obtain public perspectives and insights on the project, and their comments on alternatives. Public information meetings held during alternatives development following project scoping. Stakeholder meetings with civic associations, business owners, developers, landowners, and tenants in and near proposed station areas were held to help inform the design process and the evaluation of alternatives by incorporating the perspectives of those individuals and groups that would be most directly affected by proposed transit improvements. Stakeholder meetings were open to any individual or group wishing to attend.

A. Public Information Meetings

Public information meetings convened during the alternatives analysis process to coordinate the development, consideration and evaluation of alternatives to be considered in the Draft EIS, and to provide the opportunity for public comment. Public notification of the information meetings was provided through TV, radio, and print communication outlets. Nearly 300 people in total attended the three meetings. Following an informational presentation, participants were encouraged to discuss their concerns with representatives from DRPT and WMATA. In addition, a total of 20 comment forms were received from individuals attending the meetings. The specific issues raised at each of the meetings included the following:

January 30, 2001 at George C. Marshall High School in Falls Church:

- Pedestrian access and overpasses;
- Coordination with other transit studies;
- Service to Tysons Corner Center;
- Support for and opposition to aerial alignments;
- Cost and funding;
- Operational flexibility; and
- Enhanced bus service.

January 31, 2001 at Langston Hughes Middle School in Reston:

- Smart growth;
- Land use planning and mixed-use development;
- Pedestrian and bicycle access to station locations;
- Location of the Wiehle Avenue and Reston Parkway stations; and
- Parking.

February 1, 2001 at Ashburn Elementary School in Ashburn:

- The BRT Maintenance and Storage Facility and Metrorail S&I Yard;
- Bus and pedestrian access;
- Land use planning and mixed-use development; and
- Parking.

In addition to the specific comments summarized above, general comments were received regarding the scoping process, evaluation criteria, and other aspects of the project including:

- Impacts on the Metrorail Orange Line;
- Impact of the proposed widening of I-66 in Arlington;
- Opposition to BRT service;
- Light rail transit;
- Project schedule;
- Support for the results of the scoping process;
- Parking;
- Induced development from existing employment centers;
- Impacts of connecting to the East Falls Church or West Falls Church Metrorail Station;
- Noise, vibration, and visual impacts;
- Service design (prior to designing the tracks);
- Location of the Wolf Trap Farm Park Station and its designation as a special use station;
- Feeder bus service;
- Coordination with other transit studies and connectivity between the lines;
- High density development;
- Opposition to the Hunter Mill Road Station; and
- Locations of the BRT Maintenance and Storage Facility and the Metrorail S&I Yard.

B. Stakeholder Meetings

Meetings with stakeholders occurred throughout the project development and environmental review processes. Meetings occurred before, during and after the formal comment period so that the concerns of those most directly affected by the project were considered throughout decision-making. Comments received by stakeholders are located in Appendix J.

Stakeholder Meetings During Alternatives Analysis

Stakeholder meetings were held during the period that the project team was conducting the initial analysis of alternatives to provide project information and to obtain stakeholder input. Stakeholders typically are individuals and groups that would be most affected by proposed transit improvements. For the project, stakeholders are the business owners, developers, landowners, and tenants in and near proposed station areas. Stakeholders were identified using real estate maps and information from agencies and organizations active in the Dulles Corridor. Stakeholder meetings were open to any individual or group wishing to attend.

Stakeholder meetings were held on December 12, 13, and 14, 2000. Each meeting focused on one of three geographic sections of the corridor. Tysons Corner area; the Wiehle Avenue, Reston Parkway, Herndon-Monroe, and Route 28 areas; and the Route 606 and Route 772 areas (which include the proposed BRT Maintenance and Storage Facility and Metrorail S&I yard locations). A total of 159 stakeholders were invited to attend the meetings and approximately 60 attended.

Stakeholder Meetings During the Draft EIS Comment Period

To supplement the July 29, 30, and 31, 2002, public hearings on the Draft EIS and to enhance public understanding of the project during the Draft EIS circulation, additional meetings and presentations were made upon request to stakeholders and community groups between June 25, 2002 and August 28, 2002. These public presentations were made to increase public outreach and provide a forum for questions and comments. The presentations provided an overview of the environmental review process and results, the alternatives considered in the Draft EIS, summary of the potential effects, and an overview of project costs and financing.

Meetings were held with a variety of stakeholders including property owners, tenants, businesses, residential community associations and other organizations located along the proposed project alignment. A summary of each meeting is provided in Table 11.1-1.

Table 11.1-1: Stakeholder Meetings During the Draft EIS Comment Period

Date	Stakeholder	Meeting Purpose
June 25, 2002	Citizens Advisory Committee, National Capital Region Transportation Planning Board	Provided an overview of the Draft EIS and General Plans, financial analysis, environmental constraints and limits of disturbance.
June 26, 2002	Capital One	Provided information regarding the Metrorail Alternative and Tysons East Station location, and to discuss potential effects on the Capital One property.
June 28, 2002	Combined Chambers of Commerce (Fairfax County, Greater Reston, Greater McLean, Herndon-Dulles and Vienna-Tysons)	Provided a project status report and an overview of the Draft EIS and General Plans, financial analysis, and next steps for the project.
July 3, 2002	Rusty Blues (IBM Retirees)	Provided a project status report.
July 9, 2002	Toll Road Investors Partnership II (TRIP II)	Provided information regarding the proposed alignment in Loudoun County and discussed potential effects and impacts to the Dulles Greenway.
July 9, 2002	Providence District Homeowner Associations	Provided a project overview and discussed the various proposed alignments of the Metrorail Alternative through Tysons Corner.
July 10, 2002	Fairfax County Park Authority Board	Provided a project status report and discussed the potential effects on parks and recreational areas.
July 10, 2002	Northern Virginia Regional Park Authority (NVRPA)	Provided a project status report and discussed potential effects on the Washington & Old Dominion (W&OD) Railroad Regional Park and associated trail crossing that would be required under the Metrorail Alternative in the Reston area.
July 11, 2002	Dulles Corridor Rail Association Seminar	Provided a project status report, reviewed future land use in the vicinity of the proposed stations in Fairfax and Loudoun counties, and discussed the financial plan.
July 15, 2002	Fairfax County Supervisor Gerald Connolly	Discussed the Draft EIS recommendations and analyses.
July 16, 2002	Fairfax County Supervisor Catherine Hudgins' Draft EIS Task Force	Reviewed the Draft EIS and provided opportunity for the task force to make comments.
July 17, 2002	National Association of Industrial and Office Properties	Provided a project status report.
July 18, 2002	Mr. Art Walsh and Ms. Elizabeth Baker; Walsh, Colucci, Stackhouse, Emrich & Lubeley, P.C.	Provided information and discussed transit-oriented development and joint development possibilities at the Tysons West Station.
July 23, 2002	Fairfax County Supervisor Catherine Hudgins' Draft EIS Task Force	Continued to answer the Task Force members' questions on the Draft EIS.
July 23, 2002	Host Marriott	Provided a project status report to discuss specific questions regarding the project alignment and potential impacts to Marriott-owned property in Tysons Corner.
July 24, 2002	Hunter Mill District Public Information Meeting	Provided community members with a summary of the project background and an overview of the Draft EIS and General Plans.
July 26, 2002	Rapid Transit Action Committee	Reviewed the estimated capital, operations, and maintenance costs for the Dulles Corridor Rapid Transit Project.
August 5, 2002	Fairfax County Board of Supervisors Public Hearing	Received comments regarding the project, Draft EIS and General Plans.

Date	Stakeholder	Meeting Purpose
August 8, 2002	Tysons Corner Center, Wilmorite Properties, Incorporated	Provided a project status report and discussed the possible Metrorail alignments through Tysons Corner and the proposed location of the Tysons Central/Tysons Central D Station, with specific emphasis on the provision for station facilities on the Tysons Corner Center property.
August 13, 2002	Boston Properties, Inc.	Discussed the proposed Reston Parkway Station/Stop location, extension of the Metrorail west of Tysons Corner, pedestrian access to station, parking, bus circulation and stormwater management requirements.
August 14, 2002	Supervisor Stuart Mendelsohn, Dranesville District Civic Associations	Provided a project status report and reviewed project maps.
August 16, 2002	Centennial Contractors Enterprises	Presented a project status report and discussed the proposed Metrorail Alignments through Tysons Corner.
August 21, 2002	Greenwich Street Residents	Discussed the effects from the elevated rail line in the Dulles Connector Road, existing noise impacts from the Dulles Connector Road and West Falls Church Yard, projected noise levels from Metrorail, and proposed mitigation measures.

Stakeholder Meetings Following the Draft EIS Comment Period

Following the Draft EIS public comment period, stakeholder meetings continued upon request with elected officials, government agency representatives, property owners, tenants, and businesses along the proposed project alignment. The meetings generally included an overview of the Draft EIS public hearing process and results, and the recommendations for the proposed LPA, including a summary of the potential effects, overview of project costs, and financing. Some meetings included a discussion of project impacts to specific properties and a review of the property acquisition process. A summary is provided in Table 11.1-2 for each of the 16 meetings held during this phase.

Table 11.1-2: Stakeholder Meetings Following the Draft EIS Comment Period

Date	Stakeholder	Meeting Purpose
September 6, 2002	City of Falls Church, Virginia	Provided an overview of the Draft EIS public hearing results and the Project Team's recommendations for the Locally Preferred Alternative, including a summary of the potential effects, overview of project costs, and financing.
September 12, 2002	Dr. and Mrs. William Tyrell	Discussed the proposed lotion of a storm water management facility on a portion of the owners' property and the potential impacts.
September 18, 2002	Northern Virginia Chapter of the American Planning Association	Provided a status report and an overview of the Draft EIS and General Plans, financial analysis, and subsequent steps for the project.
September 20, 2002	Gannett Company	Provided a general project update to review the proposed General Plans for the Reston Parkway Station under the various Build Alternatives considered in the Draft EIS.
September 27, 2002	Boston Properties, Inc.	Provided a general project update to review the proposed General Plans for the Reston Parkway Station under the various Build Alternatives considered in the Draft EIS.
October 9, 2002	Dulles Corridor Rapid Transit Project Technical Working Group	Reviewed the Draft EIS public hearing process and results, the Project Team's recommendations for the Locally Preferred Alternative, including a recommended mitigation plan, and presented the subsequent steps in the environmental review process.
October 10, 2002	Federal Aviation Administration District Office	Reviewed the Draft EIS public hearing process and results, the Project Team's recommendations for the Locally Preferred Alternative, including a recommended mitigation

Date	Stakeholder	Meeting Purpose
		plan, and presented the subsequent steps in the environmental review process.
October 15, 2002	Signature Flight Support	Presented the Project Team's recommendations for the Locally Preferred Alternative, discussed the current horizontal and vertical rail alignment on airport property and the methods of underground construction envisioned for this area.
October 15, 2002	Leo Schefer, Washington Airports Task Force	Discussed the Public Hearings Report and the Project Team's basis for recommending the T-6 alignment as the LPA.
October 17, 2002	Host Marriott	Provided a project update, including the Draft EIS public hearing results, the Project Team's responses to Host Marriott's comments on the Draft EIS, the Project Team's recommendations for the Locally Preferred Alternative, and a discussion of the relocation of the portal away from the Dulles Airport Marriott frontage.
October 18, 2002	Fairfax County Board of Supervisors Transportation Committee	Provided an overview of the purpose and need for transit improvements in the Dulles Corridor, the Draft EIS public hearing process and results, and the Project Team's recommendations for the Locally Preferred Alternative, including a summary of the potential effects, overview of the project costs, and financing.
October 21, 2002	Marsteller Realty and Merchant's Tire and Auto	Provided participants with an overview of the project and discussed the proposed facilities at Tysons Central C Station.
October 23, 2002	Carr America	Provided a project update, including the Draft EIS public hearing results and the Project Team's recommendations for the LPA.
October 24, 2002	Holly Haley, Federal Realty Investment Trust	Provided an overview of the project and discussed the project impacts on Pike 7 Plaza and on an existing retail center adjacent to the proposed Tysons Central C station facilities.
October 25, 2002	Boston Properties, Inc.	Discussed alternative access and configuration options for the proposed Reston Parkway Station and Kiss & Ride facilities.
October 28, 2002	Fairfax County Board of Supervisors	Project Team answered questions about the project.

Stakeholder Meetings During the Supplemental Draft EIS Comment Period

WMATA and DRPT made presentations to several community groups and stakeholders during the public comment period for the Supplemental Draft EIS. These presentations provided an overview of refinements to the LPA as documented in the Supplemental Draft EIS. These presentations were made in an effort to increase public outreach and provide a forum for questions and comments. A standard presentation was used at a majority of these meetings. For some meetings, the presentation was modified to address specific issues and concerns of the audience. Comments received during these meetings are located in Appendix J. Federal, state, and local agency comments and coordination are located in Appendix K.

Presentations were given to groups and a variety of stakeholders including property owners, tenants, businesses, residential community associations and other organizations in the proposed project corridor. A total of 23 meetings were held between October 31, 2003, the date the Supplemental Draft EIS was made available to the public, and December 29, 2003, the end of the Supplement Draft EIS public comment period. A summary of each meeting is provided in Table 11.1-3 below. In addition to these meetings, the Dulles Corridor Steering Committee met on November 24 and December 10, 2003 for updates on the project.

Table 11.1-3: Stakeholder Meetings During the Supplemental Draft EIS Comment Period

Date	Stakeholder	Meeting Purpose
November 5, 2003	Fairfax County Non-Motorized Transportation Subcommittee	Reviewed issues of pedestrian and bicycle access to the proposed stations.
November 5, 2003	Fairfax County Supervisor Catherine Hudgins	Discussed the results of Supplemental Draft EIS.
November 5, 2003	Hunter Mill District Council	Provided a project status report.
November 10, 2003	VDOT Northern Virginia District Office (NoVa) and Fairfax County	Discussed roadway mitigation measures.
November 19, 2003	City of Falls Church	Discussed the West Falls Church Yard and updated the City on the project and Supplemental Draft EIS.
November 19, 2003	Commercial property owners at Wiehle Avenue Station	Briefed the property owners about project revisions and discussed station facilities and land requirements of the proposed Wiehle Avenue Station.
November 19, 2003	Westhampton Civic Association	Briefed the community prior to the two public hearings about project revisions and effects on the surrounding area.
November 20, 2003	HBL Group and Tysons dealerships	Provided project status and effects.
November 24, 2003	Dulles Corridor Rail Association	Annual meeting. Provided a project status report.
November 25, 2003	Clyde's Restaurant and Tysons Square/Relm Inc.	Provided a briefing on project status and discussed the effects of proposed facilities in the area of Tysons Central 7 Station.
November 25, 2003	Communities at West Falls Church Yard and residents at Tie Breaker Station location	Discussed the revisions to the West Falls Church Yard, project effects on the surrounding area, the TBS location and the access driveway at Baldwin Drive.
November 25, 2003	Town of Herndon and commercial property owners	Town Hearing on the Transportation Improvement District.
December 1, 2003	HBL Group and Tysons Properties LLC/Storehouse	Provided a briefing about project status and discussed the effects of proposed facilities.
December 1, 2003	Reston Association Board and Civic Associations	Provided an update on the project and the effects of the project revisions on the surrounding areas.
December 2, 2003	Town of Herndon and commercial property owners	Town Council vote on the Transportation Improvement District
December 5, 2003	Toll Road Investors Partnership II (TRIP II)	Reviewed the project status and discussed any outstanding issues or concerns.
December 9, 2003	Marsteller Realty Inc./Merchant Tire & Auto	Discussed the project status and its effects on Merchant Tire & Auto and the surrounding area.
December 10, 2003	Agency Coordination	Reviewed with representatives from the agencies and jurisdictions affected by the project, the revisions documented in the Supplemental Draft EIS and provided an update on the status of Preliminary Engineering.
December 11, 2003	HBL Group	Discussed the Tysons West Station facilities.
December 12, 2003	VDOT Northern Virginia District Office and Fairfax County	Discussed roadway mitigation measures.
December 15, 2003	Town Council of Vienna	Provided a project status report and discussed the effects of the project on the traffic along Maple Avenue and Route 123.
December 17, 2003	Ray Updike/1992 Chain Bridge Road	Discussed the status of the project and its effects on the area surrounding the property.
December 17, 2003	Chuch Veatch/Reston Self Storage	Discussed the effects of proposed facilities at the Wiehle Avenue Station and property acquisition requirements.

Stakeholder Meetings Following the Supplemental Draft EIS Comment Period

In an effort to increase public outreach and provide a forum for questions and comments on the project team's recommendations for the revised LPA, the project team continued to hold meetings with stakeholders after the Supplemental Draft EIS review period ended on December 29, 2003. Public comments and agency coordination are located in Appendices J and K, respectively.

A summary is provided in Table 11.1-4 below for each of the meetings held from December 30, 2003 through March 2, 2004.

Table 11.1-4: Stakeholder Meetings Following the Supplemental Draft EIS Comment Period

Date 2004	Stakeholder	Meeting Purpose
January 6, 2004	Town of Herndon Council Special Work Sessions	Technical question and answer workshop on alternative scenarios for project implementation and on a transportation improvement district.
January 22, 2004	Fairfax County Supervisor Hudgins	Review of Team Recommendations.
January 23, 2004	Ourisman Automotive	Proposed development of American Security Storage property.
January 28, 2004	Fairfax County Supervisor Smyth	Review of Team Recommendations.
January 29, 2004	RMC Tyco, LLC	Options for Tysons West Station facilities.
January 29, 2004	Fairfax County Chairman Connolly	Review of Team Recommendations.
February 2, 2004	Fairfax County Supervisor DuBois	Review of Team Recommendations.
February 9, 2004	Cherner Lincoln Mercury	Options for Tysons West Station facilities.
February 12, 2004	Northern Virginia Regional Park Authority (NVRPA)	Project effects on W&OD Railroad Regional Park.
February 19, 2004	Rosenthal Honda	Options for Tysons West Station facilities.
February 20, 2004	Peacock Buick	Options for Tysons West Station facilities.
February 23, 2004	Fairfax County and commercial property owners	County Hearing on Phase 1[1] Transportation Improvement District
February 25, 2004	Fairfax County Park Authority	Alternative location of Tie Breaker Station 2 and access driveway at Olney Park.
February 26, 2004	Tamarack Homeowners Association	Project status and traffic effects of Phase 1[1] on Hunter Mill Road and at Wiehle Avenue Station.
March 2, 2004	WestPark Hotel and SAIC	Tysons Central 7 Station entrance.
March 2, 2004	Wiehle Avenue Steering Committee of Fairfax County Supervisor Hudgins	Recommended traffic mitigation measures and joint development initiative at Wiehle Avenue Station.
April 9, 2004	Robert Young, property owner of McLean Self Storage Parcel	Discussed Tysons West Station options.
April 21, 2004	Tysons Corner Center/ Cooley Godward LLP/RTKL	Discussed Tysons Central 123 Station.
May 3, 2004	Fairfax County Non-Motorized Transportation Subcommittee	Discussed station access in general, in addition to the Tysons Central 7 entrance.
May 14, 2004	Cherner Lincoln/Mercury and Peacock Buick	Discussed Tysons West Station options.
May 24, 2004	Chris Antigone, owner and developer at Route 696 Station	Discussed Route 606 Station alternatives.
May 27, 2004	HBL, Cherner Lincoln/Mercury and Peacock Buick.	Discussed Tysons West Station options.
June 10, 2004	Virginia Baseball Stadium Authority & Developer	Discussed a proposed stadium near the Route 28 Station.
July 14, 2004	Rosenthal Honda	Discussed Tysons West options.
July 22, 2004	Transportation Committee of Fairfax County Planning Commission	Provided a Project status update.

Note:
[1]Phase 1 refers to the Wiehle Avenue Extension.

11.1.2.3 Public Hearings on the Draft EIS and the Supplemental Draft EIS

Public hearings were held to support the environmental review process under NEPA during public circulation of the Draft EIS and the Supplemental Draft EIS.

Public hearings on the Draft EIS and the Supplemental Draft EIS were conducted in accordance with NEPA requirements, Federal Transit Administration (FTA) regulations and guidelines, the procedures of the Commonwealth of Virginia, and WMATA Compact requirements. A number of means were used to notify the public of the release of both the Draft EIS and the Supplemental Draft EIS and the opportunity to review and comment on the document and proposed project. A summary of the public notification process and an overview of the public hearings are provided below. More detailed information relating to the comments received at each hearing and during the comment period, how these comments influenced project design, and the responses to the comments is provided in section 11.3 of this chapter and in Appendix J.

A. Public Hearings on the Draft EIS

The public hearings on the Draft EIS are described below in terms of notification, attendance, and comments received.

Draft EIS Public Hearing Notification

On July 12, 2002, the Notice of Availability of the Draft EIS was published by the Environmental Protection Agency (EPA) in the *Federal Register*, and included the times and location of public hearings at three different locations in the project corridor:

Monday, July 29, 2002 Spring Hill Elementary School 8201 Lewinsville Road McLean, Virginia 22102	Hearing No. 147, Docket R02-1
Tuesday, July 30, 2002 Langston Hughes Middle School 11401 Ridge Heights Road Reston, Virginia 22091	Hearing No. 148, Docket R02-1
Wednesday, July 31, 2002 Stone Bridge High School 43100 Hay Road Ashburn, Virginia 20147	Hearing No. 149, Docket R02-1

To help the public to prepare for the public hearings and to facilitate public participation in the project, on June 28, 2002, the Draft EIS and General Plans for the Dulles Corridor Rapid Transit Project were made available for public review and comment at 30 locations including local libraries and other community facilities. Public notices of the hearings were published in the Washington Post on June 28 and July 5, 2002. Additional advertisements of the availability of the Draft EIS and the upcoming public hearings also appeared in the *Northern Virginia Journal*, the *Connection Newspaper*, and the *Times Community Newspaper*.

Press releases in English and Spanish announcing public hearing dates were delivered to over 60 media outlets in the region on July 22, 2002. Meeting announcements designated for public service broadcasting were sent to over 50 radio and television stations in the region. In addition, announcements for posting on television "bulletin boards" were delivered to Loudoun Cable Television, Fairfax Cable Access Television, Reston Comcast Cable Television, and Herndon Community Television. Public hearing information was available on the project website, at the project information center in Reston and the Tysons Center kiosk, and at libraries and community centers throughout Fairfax and Loudoun counties. A project newsletter announcing the Draft EIS public hearings was sent to over 11,000 recipients.

In all, approximately 13,000 Notices of Public Hearings were distributed. The Notice of Public Hearings (Notice) was distributed to properties in the vicinity of the proposed project improvements, including hand delivery to 2,728 properties and tenants located in the vicinity of the proposed transit improvements. In addition, the Notice was sent by first-class mail to 5,661 property owners and tenants within the project area. The Notice was also sent via United States Postal Service Certified Mail to the 94 property owners from whom property may be acquired. In addition, the Notice was distributed to state and local agencies and representatives of civic associations within the study area.

Draft EIS Public Hearing Attendance

Over the three-night period, approximately 750 people were in attendance, with a total of 110 witnesses providing testimony. In addition, 131 comment cards were received. A court reporter was available at each hearing to record oral comments from those not wishing to speak publicly. Attendees were also encouraged to complete a comment card, submit a letter, or send an e-mail if they preferred not to provide testimony. Additional information on public hearing attendance is included in the October 2002 *Public Hearings Report – Review of Public Hearings and Project Team Recommendations for the Draft Environmental Impact Statement and General Plans* (Draft EIS Public Hearings Report).

Draft EIS Public Hearing Comments

An overview of the comments provided at each of the three public hearings is provided below. Appendix J of this Final EIS includes a more detailed summary of all public comments and responses.

July 29, 2002 Draft EIS Public Hearing - Approximately 350 people attended the hearing at Spring Hill Road Elementary School near Tysons Corner in McLean. Attendees included elected officials, representatives from interest groups, local businesses, and neighborhood associations, as well as concerned citizens living in proximity to the proposed improvements. Of the 41 people providing comments, 25 supported Metrorail, five supported BRT, one supported BRT/Metrorail, two supported Phased Implementation, two supported a monorail/light rail mode, and six provided comments but did not state a preference for an alternative. Comments included:

- Support for the project and Metrorail Alternative;
- Support for bus rapid transit (BRT);
- Need for rapid transit to Dulles Airport;
- Need to address traffic congestion and improve air quality;
- Visual effect of an aerial alignment through Tysons Corner;
- Maximizing transit oriented development and air rights development opportunities;
- Metrorail only through Tysons Corner and implementing Express Bus Service to the west in Reston, Herndon and Loudoun County;
- Concern about the placement of parking garages;

- Potential traffic effects on adjacent local streets;
- Adequate parking at the western terminus and the lack of parking at the proposed Route 772 Station;
- Effects of increased land use densities triggered by transit improvements;
- Existing and project-related noise impacts at and near the West Falls Church Service and Inspection (S&I) Yard;
- Additional analysis of local roadway impacts;
- Proposed noise mitigation measures;
- Feeder bus, bicycle, and pedestrian access to transit stations; and
- Need for innovative financing (i.e., through the Public Private Transportation Act (PPTA) and concern about the adequacy and fairness of funding sources.

July 30, 2002 Draft EIS Public Hearing - Approximately 250 people attended the hearing at Langston Hughes Middle School in Reston including elected officials, representatives from interest groups and neighborhood associations, as well as concerned citizens and primary landowners living in proximity to the proposed improvements. Of the 39 witnesses providing oral comments, 34 provided public testimony and five provided comments directly to the court reporter. Of the 39 witnesses, 24 supported Metrorail, four supported BRT, one supported Phased Implementation, one supported a monorail/light rail mode, three supported rapid transit but stated no preference for an alternative, and six provided comments but did not state a preference for an alternative. Comments at the hearing included:

- Opinion on the Metrorail Alternative;
- Opinion on BRT;
- Metrorail through Tysons Corner only;
- Opinion on alignment T8;
- Concern about existing and project-related noise;
- Location of a proposed storm water management pond and a traction power substation;
- The amount of time provided to the public for review of the Draft EIS and submission of comments;
- Adequacy of the analysis to determine neighborhood impacts (i.e. noise, existing residential water wells, increased traffic volumes on local streets and overflow parking); and
- Access to the Reston Parkway Station from all four quadrants of the interchange between Reston Parkway and the Dulles Toll Road.

July 31, 2002 Draft EIS Public Hearing - Approximately 150 people attended the final public hearing at Stone Bridge High School in eastern Loudoun County, including elected officials, representatives from interest groups and neighborhood associations, as well as concerned citizens and primary landowners living and working in proximity to the proposed improvements. Of the 30 witnesses providing oral comments, 28 witnesses provided public testimony and two provided comments directly to the court reporter. Of the 30 witnesses, 20 supported Metrorail, three supported BRT, one supported monorail, one supported rapid transit but stated no preference, and five provided comments but did not state a preference for an alternative. Comments made at the hearing included:

- Opinion on the Metrorail Alternative;
- Opinion on BRT;
- Opinion on Yard Site 15;

- § Concern over Loudoun County's self-imposed prohibition to regional park-and-ride lots within transit oriented development areas, citing the need for adequate commuter parking facilities at the terminus of the system (Route 772) to maximize ridership opportunities;
- § Increased tolls;
- § Traffic congestion resulting from the additional build-out of residential, retail, office and hotel uses around the station areas;
- § Financial impacts of Loudoun County becoming an active member of the WMATA;
- § Importance of "connectivity" to local neighborhoods and the expansion of transit within the county for those who prefer to use public transportation but cannot drive to access rapid transit; and
- § Need for adequate bus and feeder systems, as well as bicycle and pedestrian access.

The comments received at the public hearings and during the Draft EIS circulation and comment period were assessed by the project team, and used as a basis for future project recommendations, including the selection of a Locally Preferred Alternative. The comments and responses were documented in the Draft EIS Public Hearings Report as was project background summaries of the public hearings; public hearing presentation; comments received for the record and meetings held during the comment period; responses to comments received for the public record; and recommendations of the project team for the Build Alternative, general plans, mitigation plan, continuing coordination and unresolved issues. Appendix J of this document contains responses to comments received at the public hearings and during the Draft EIS circulation and comment period. Agency coordination is provided in Appendix K.

The Draft EIS Public Hearings Report was sent to state, regional, and local governments and agencies, elected officials, community organizations, private parties who presented testimony or submitted supplemental material for the record, all property owners on the official property acquisition list, and others who had previously expressed interest in the project. In total, approximately 1,200 copies of the Report were distributed for public review. In addition, the Report was made available on the project web site at www.dullestransit.com. Comments on the Report were accepted until November 1, 2002.

Comments on the Draft EIS Public Hearings Report were received from 11 public agencies and 35 private parties. Comments made on the Draft EIS Public Hearings Report included:

- § Opinion about the Project;
- § Noise mitigation;
- § Visual impacts;
- § Traffic and parking impacts in neighborhoods;
- § Aerial alignments;
- § Acquisitions and compensation;
- § Endangered species;
- § S&I Yard Site 15; and
- § Parking at Route 772.

The comments and responses were documented in the November 2002 Draft EIS Public Hearings Report Supplemental, and can be viewed in Appendix J. Agency coordination is provided in Appendix K.

B. Public Hearings on the Supplemental Draft EIS

The public hearings on the Supplemental Draft EIS are described below in terms of notification, attendance, and comments received.

Supplemental Draft EIS Public Hearing Notification

On November 7, 2003, the EPA published a Notice of Availability for the Supplemental Draft EIS in the *Federal Register* indicating the date, time and location of public hearings at two locations:

Wednesday, December 3, 2003 — Hearing No. 159, Docket R03-6
Langston Hughes Middle School
11401 Ridge Heights Road
Reston, VA 20191

Thursday, December 11, 3003 — Hearing No. 160, Docket R03-6
Farmwell Station Middle School
44281 Gloucester Parkway
Ashburn, VA 20147

To assist the public in preparing for the upcoming December 2003 public hearings, the Supplemental Draft EIS and General Plans for the Dulles Corridor Rapid Transit Project were made available for public review on October 31, 2003. Copies of these documents were available at the local libraries and other community facilities. The Supplemental Draft EIS was also circulated to federal, state, and local agencies for review and comment (as described in section 11.2).

A number of means were used to notify the public of the release of the Supplemental Draft EIS, the opportunity to review and comment on the document and proposed project, and the December public hearings in accordance with the requirements of the WMATA Compact and federal regulations. Notice of the hearings was published in the *The Washington Post* on November 1 and 8, 2003. Public hearing advertisements were also published in the *Connection Newspaper* (Reston, Herndon, Vienna/Oakton, McLean, and Loudoun County), the *Washington Post* (Metro section and Fairfax and Loudoun Extras), the *Times Community Newspaper* (Reston/Herndon, Vienna/McLean/Great Falls, and Eastern Loudoun County), and the *Observer Newspaper* (Herndon, Reston, and Eastern Loudoun County). Press releases (in English and Spanish) announcing public hearing dates were delivered to 48 media outlets in the region on November 12, 2003. Meeting announcements designated for public service broadcasting were sent to 32 radio and television stations in the region. In addition, announcements on television "bulletin boards" were delivered to Loudoun Cable Television, Fairfax Cable Access Television, Reston Comcast Cable Television, and Herndon Community Television.

Public hearing information was available on the project website, www.dullestransit.com, at the 3-D architectural model of the Tysons Corner Metrorail alignment options displayed at Tysons Corner Center, and at 28 locations, including a variety of public libraries and community centers throughout Fairfax and Loudoun counties. A project newsletter announcing the public hearings was sent to approximately 12,000 residents.

Approximately 8,560 Notices of Public Hearings (Notice) were distributed. The Notice was hand-delivered to 2,735 property owners and tenants located in the vicinity of the proposed transit improvements, and was sent by first-class mail to 3,372 property owners and tenants. The Notice was also sent via United States Postal Service Certified Mail to 74 property owners from whom property may be acquired. The Notice was also distributed to state and local agencies and representatives of civic associations within the study area.

Supplemental Draft EIS Public Hearing Attendance

Over the two-night period, a total of 48 witnesses provided testimony and eight comment cards/exhibits were collected. A court reporter was available at the December 3 hearing to record oral comments from those not wishing to speak publicly. Attendees were encouraged to encouraged to complete a comment card, submit a letter, or send an e-mail if they did not want to provide testimony. Additional information on public hearing attendance is included in Appendix J of this FEIS as well as in the February 2004 *Public Hearings Report for the Supplemental Draft Environmental Impact Statement and General Plans* (Supplemental Draft EIS Public Hearings Report Supplement).

Supplemental Draft EIS Public Hearing Comments

An overview of the comments provided at each of the two public hearings is provided below. Appendix J includes a more detailed summary of all public comments and responses.

December 3, 2003 Supplemental Draft EIS Public Hearing - Approximately 156 people attended the hearing. Attendees included elected officials, representatives from interest groups, civic associations, area businesses, as well as concerned citizens living in proximity to the proposed project alignment. Of the 31 witnesses who provided oral comments, 28 witnesses provided public testimony, and three people provided comments directly to the court reporter. Twenty of the witnesses provided oral comments in support of the project, although some had conditions of support. Main comments at the hearing related to:

- Phased implementation of the LPA;
- Vehicular traffic noise;
- Visual impacts and sound barriers;
- Coordination and accountability between agencies;
- Traffic analysis needed on neighborhood streets;
- Importance of getting rail to Tysons Corner;
- Design of station parking;
- Mode changes;
- Pedestrian, bike and feeder bus access;
- Intersection improvements and traffic calming measures;
- Tolls;
- Existing traffic congestion, particularly near Wiehle Avenue; and
- The proposed tax assessment district.

December 11, 2003 Supplemental Draft EIS Public Hearing – Representation at the hearing included elected officials, representatives from interest groups, civic associations, area businesses, as well as concerned citizens living in proximity to the proposed project alignment. Approximately 41 people attended, with 17 people providing oral comments. Of those providing testimony, 13 supported the project, some with conditions of support. Main comments at this hearing included:

- Immediate need for rail in Loudoun County;
- Station parking design;
- Mode changes;
- Pedestrian, bike, and feeder bus access for transit oriented development;
- Noise mitigation;
- Moving pedestrian access or extending platforms over roads;
- Need for two entrances at each station;

- Coordinating noise mitigation;
- Modifying station/parking designs;
- Location and design of the station and Kiss & Ride at Tysons West;
- Bus rapid transit; and
- Transportation improvement district for Fairfax County.

The comments received at the public hearings and during the Supplemental Draft EIS circulation and comment period were assessed by the project team and basis for future project recommendations, including the selection of a Locally Preferred Alternative. The comments and responses are documented in the February 2004 Supplemental Draft EIS Public Hearings Report, as well as in Appendix J of this Final EIS. Agency coordination is provided in Appendix K.

The Supplemental Draft EIS Public Hearings Report was sent to state, regional, and local governments and agencies, elected officials, community organizations, private parties who presented testimony or submitted supplemental material for the record, all property owners on the property acquisition list, and others who had previously expressed interest in the project. In total, approximately 600 copies of the report were distributed. In addition, the document was made available on the project website at www.dullestransit.com. Comments on the Supplemental Draft EIS Public Hearings Report were accepted until February 25, 2004.

Comments on the Supplemental Draft EIS Public Hearings Report were received from 17 individuals and six public agencies. The comments were reviewed to identify issues raised for further consideration in the Final EIS, and to identify potential additional alternatives that would meet the project's purpose and need. The comments received were addressed in the March 2004 Supplemental Draft EIS Public Hearings Report Supplement, and can be viewed in Appendix J of this Final EIS.

Main comments received on the Supplemental Draft EIS Public Hearings Report included:

- Tysons West Station Design and Operation;
- Tysons Central 7 Station Design and Operation;
- Wiehle Avenue Station Design and Operation;
- Route 772 Station Design and Operation;
- Noise mitigation efforts;
- Transit service from Herndon-Monroe;
- Premium Bus Service replacing Express Bus Service; and
- Financial analyses.

The project recommendations resulting from a review of the public record were made available on the project website at www.dullestransit.com.

C. Post-Hearing Conference

On Tuesday, May 18, 2004, a post-hearing conference was held by DRPT and WMATA at the following location:

McLean Governmental Center
1437 Balls Hill Road
McLean, Virginia 22101

The purpose of the post-hearing conference was to receive and consider comments, suggestions and alternatives on alternative site plans and locations for Tie-Breaker Station #2. Traction Power Substation #2, and the Tysons West Station entrance and facilities.

Approximately 60 people were in attendance. Attendees included elected officials, representatives from county agencies and local businesses, as well as concerned citizens living in proximity to the proposed improvements. Of the 14 attendees who provided oral testimony, four spoke regarding Tie Breaker Station #2, two of whom opposed Option B and two of whom presented concerns over the effects of Option A on their homes. Ten people spoke about Tysons West Station entrance and facilities, most of whom favored Option C or D.

Written or electronic comments were accepted through June 1, 2004. Comments were also accepted verbally and in writing at the post-hearing conference. Main comments at the conference included:

- Continuing dialogue with developers and the public;
- Tysons West Station options;
- New variations of Tysons West Station Options C and D;
- Impact of Tie Breaker Station #2 Option B on Tuckahoe Recreation Club; and
- Effects of Tie Breaker Station #2 Options A and B on neighboring properties.

A Post Hearing Conference Report and Supplement were prepared for public review and for the decision-making Boards, respectively. Comments from these meetings are included in Appendix J.

11.1.3 CONTINUING PUBLIC OUTREACH EFFORTS

To maintain public and stakeholder support for the project, DRPT will continue public outreach efforts throughout preliminary engineering and final design. The focus of these outreach activities will be to keep the public, stakeholders, and affected property owners informed about he project's progress. Continuing outreach efforts may include participation in community outreach activities and public information meetings and events, circulate project newsletters, brochures, and fact sheets, project website updates, and development of presentations or meeting materials for interested parties.

11.2 AGENCY COORDINATION

This section summarizes the coordination with local, state, and federal agencies to support the environmental review process for the project in terms of early agency coordination and scoping and ongoing agency coordination and comments. Agency comments and correspondence are provided in Appendices J and K.

Coordination activities began with publication of a Notice of Intent to Prepare (Notice) an EIS in the *Federal Register* on June 26, 2000. This Notice was also published in the legal section of the *Washington Post*.

FTA is the lead agency for the project, the DRPT is the project sponsor, WMATA is the technical manager, and FAA is acting as a cooperating agency. Coordination activities have involved federal, state and local environmental, regulatory, and resource agencies. These agencies have provided technical

expertise regarding the identification of resources, impacts assessment, and development of mitigation. Major issues raised as a result of agency comments include:

- Potential noise impacts along the corridor and at West Falls Church S&I Yard;
- Visual impacts and aesthetic effects;
- Safety and security;
- Changing Virginia Pollution Discharge Elimination System (VPDES) requirements for the Commonwealth of Virginia;
- Section 106 coordination and Section 4(f) coordination;
- Wetlands management; and,
- Traffic and parking impacts.

Appendix J contains the complete listing of comments received from agencies during the preparation of the Draft and the Supplemental Draft EIS. Appendix K contains agency correspondence.

11.2.1 EARLY AGENCY COORDINATION AND SCOPING

Early agency coordination and scoping activities are described in the following subsections.

11.2.1.1 Agency Interviews

Interviews with agencies were initiated in April 2000 to present the schedule for the preliminary engineering and environmental phase of the project, to review the initial scope of work, and to describe the known alternatives and their locations. Agency interviews included:

- April 11, 2000 - Fairfax County;
- April 21, 2000 - Metropolitan Washington Airports Authority (MWAA);
- May 25, 2000 - Virginia Department of Transportation (VDOT);
- June 16, 2000 - Loudoun County; and
- August 14, 2000 - Metropolitan Washington Airports Authority (MWAA).

Issues discussed at the meetings included:

- Configuration of the Dulles Airport Station, including accommodation of a future people-mover, and methods to minimize disruption to ground transportation facilities and operations during construction;
- Coordination with the State Historic Preservation Officer (SHPO) with regard to the historic resources of the Dulles Airport terminal;
- Appropriate agency contacts for project coordination;
- The region's long-range plan and Fairfax County's Comprehensive Plan;
- Designing the pedestrian bridges of the project's stations to be freely accessible by the general public rather than solely by BRT or Metrorail patrons;
- Improvements planned for the Dulles Toll Road and Access Road;
- Impacts on parking, bus, and Kiss & Ride facilities at East Falls Church Station;
- Extension of BRT service to East Falls Church;
- Evaluation of land use impacts;
- Pedestrian/bikeway bridge to provide access to the West Falls Church Station from the south side of I-66;
- Orange Line capacity;

- § Fairfax County's procedural requirements for amending the Comprehensive Plan for special exemptions and for planning approvals;
- § A loop alignment with two tracks in lieu of the single track along Routes 123 and 7;
- § Locating Wolf Trap Farm Park Station as part of the decision-making process during the preparation of the Draft EIS;
- § Pedestrian access between all four quadrants of the Reston Parkway interchange and the Reston Town Center Station;
- § Planned developments and highway construction in station areas;
- § The MIS evaluation of BRT Maintenance and Storage Facility and Metrorail S&I Yard sites; and
- § Current shuttle bus operations in the corridor.

11.2.1.2 Agency Pre-Scoping

Pre-scoping packets were sent to 54 federal, state, and local agencies in June 2000 and included a project schedule, preliminary scope of work, the FTA Notice of Intent, and an invitation list for the pre-scoping meeting.

The pre-scoping meeting was held July 11, 2000 and was attended by representatives from the 15 agencies listed in Table 11.2-1. Characteristics of the BRT and Metrorail alternatives to be analyzed in the EIS, including line, stations/stops, and ancillary facilities in each segment of the corridor were presented at the meeting. Attendees were encouraged to attend the formal agency scoping meeting on July 27, 2000.

Discussion among the attendees raised the following issues:

- § Locations of wide spots within the DAAR ("bubbles") to accommodate the proposed stations;
- § Design issues at Dulles Airport, including the integration of a separate planned people-mover project, subway station width and depth, and BRT stops not interfering with existing ground activity, wetlands and floodplains on the property, and the impacts of cut-and-cover versus tunneling;
- § Making the FAA a cooperating agency;
- § Location of the BRT Maintenance and Storage Facility and Metrorail S&I Yard;
- § Impacts of various alternatives on the local highway and roadway systems, including increased traffic on local roadways, which will require roadway improvements;
- § Tysons Corner loop alignment;
- § Protection of right-of-way for future use;
- § Locations of park-and-ride lots and pavilion entrances;
- § Elevated structures versus tunnels;
- § Trails and pedestrian access;
- § Public involvement;
- § Visual impacts; and
- § Impacts to Scotts Run Park.

11.2.1.3 Initial Agency Scoping

A formal agency scoping meeting was convened at the Center for Innovative Technology in Herndon on July 27, 2000. Representatives from ten agencies attended, as listed in Table 11.2-1. The project components and some of the comments received during the public scoping meetings held on the previous two evenings were reviewed. In addition, a report summarizing the concerns raised at the pre-scoping meeting was made available to all attendees.

Table 11.2-1: Agency Attendance at Pre-Scoping and Scoping Meetings

Agency Pre-Scoping Meeting July 11, 2000	Agency Scoping Meeting July 27, 2000
Federal Federal Aviation Administration (FAA) Regional Metropolitan Washington Airports Authority (MWAA) State Virginia Department of Conservation and Recreation Virginia Department of Environmental Quality (VDEQ) Virginia Department of Transportation (VDOT) Local City of Falls Church Fairfax County Department of Planning and Zoning Fairfax County Department of Transportation Fairfax County Park Authority Fairfax County Loudoun County Northern Virginia Regional Park Authority Northern Virginia Transportation Commission (NVTC) Town of Herndon Town of Vienna	Regional Metropolitan Washington Airports Authority (MWAA) Metropolitan Washington Council of Governments (MWCOG), Transportation Planning Board (TPB) State Virginia Department of Transportation (VDOT) Virginia Department of Forestry Local City of Falls Church Fairfax County Department of Planning and Zoning Fairfax County Department of Transportation Loudoun County Building and Development Northern Virginia Transportation Commission (NVTC) Town of Herndon

Discussion among the attendees raised the following issues:

- Including time for County Board of Supervisors' endorsement of project in the schedule;
- Evaluation of the travel time impacts of the various alignments;
- Additional alternatives and stations for evaluation;
- Travel demand modeling methods;
- Pedestrian access to stations; and
- Options for a light rail circulator in Tysons Corner.

11.2.1.4 Agency Data Requests

In January 2001, agencies were requested to provide information regarding natural and cultural resources in the Dulles Corridor, which were used to evaluate the environmental impacts of proposed alternatives (as documented in the Technical Reports and the Draft EIS). The following agencies were sent requests for information regarding the presence of resources in the corridor under their jurisdiction.

- Virginia Department of Agriculture and Consumer Services;
- Virginia Department of Conservation and Recreation;
- Virginia Department of Environmental Quality;
- Virginia Department of Game and Inland Fisheries;
- Virginia Department of Historic Resources; and
- United States Fish and Wildlife Service.

11.2.1.5 Agency Coordination Meetings

In May 2001, representatives from 72 agencies were invited to attend Agency Coordination Meetings. For convenience to the attendees, meetings were held on two dates (June 11 and 13, 2001) and in two locations (Herndon and Richmond). The meetings provided updated project information and information regarding data collection efforts and impact assessment methodologies. The meetings were followed by question and answer sessions. Table 11.2-2 lists the agencies that attended each meeting.

Table 11.2-2: Agency Coordination Meetings

Agency Coordination Meeting June 11, 2001	Agency Coordination Meeting June 13, 2001
Federal FTA National Park Service United Sates Environmental Protection Agency (EPA) USACE Regional MWCOG MWAA State Virginia Department of Transportation (VDOT) Virginia Department of Emergency Management Local Arlington County Department of Public Works City of Falls Church Fairfax County Department of Planning & Zoning Fairfax County Department of Transportation Fairfax County Economic Development Authority Fairfax County Water Authority Loudoun County Administrator Loudoun County Office of Transportation Services Northern Virginia Regional Park Authority Town of Herndon	Federal Federal Highway Administration (FHWA) State Virginia Department of Environmental Quality Virginia Marine Resources Commission Virginia Department of Conservation and Recreation Virginia Department of Transportation (VDOT) Virginia Department of General Services Virginia Department of Agriculture and Consumer Services Virginia Department of Labor and Industry

The issues raised by agency representatives at the Agency Coordination Meetings were as follow:

- § Consideration of the additional impervious surface of the third lane of the DIAAH in stormwater management and drainage plans;
- § Identification of parks, trail paths, proposed parks, and greenways in the project area;
- § Assessment of the value of station area development;
- § Utilization of BRT facilities after Metrorail is in place;
- § Landscaping stormwater facilities to use as community facilities;
- § Potential presence of rare mussels in streams in project area;
- § Diabase Glades located near project area, which support rare plants;
- § Wetlands near station areas;
- § Funding issues;
- § Noise barrier construction;
- § Traffic impacts;
- § Operation plan assumptions for feeder bus headways;
- § The location and historic status of the Sunset Hills Railroad Station along the W&OD Trail; and
- § Long-range plans for extending the project to Leesburg.

11.2.1.6 Supplemental Agency Scoping

In November 2001, the Steering Committee for the Dulles Corridor Rapid Transit Project asked DRPT and WMATA to consider alternatives to the Metrorail S&I Yard Site 7. In response, a Supplemental Rail Yard Study to examine different end-of-line locations for an S&I Yard was initiated. Pre-Scoping and Scoping meetings were held to solicit input on the initial list of yard sites to be considered.

A. Supplemental Agency Pre-Scoping Meetings

Pre-Scoping meetings were held on December 7 and 17, 2001, with MWAA, VDOT, and Loudoun County; and FAA and MWAA, respectively.

Discussion among the attendees raised the following issues:

- A request to eliminate the current S&I Yard Site 7 because of potential economic development plans on the site;
- The fact that the lease under which MWAA operates Dulles Airport requires 100 percent aeronautical use by the lease covenant; and
- Regulations on the use of land purchased with FAA grants.

B. Supplemental Agency Scoping Meetings

A Scoping Meeting was convened at the Dulles Hyatt on January 22, 2002. Representatives from 15 agencies attended as listed in Table 11.2-3. A brief project overview and a status report were presented, and input from agency representatives was solicited.

Table 11.2-3: Agency Attendance at Supplemental Rail Yard Study Pre-Scoping and Scoping Meetings

Agency Pre-Scoping Meeting December 7 and 17, 2001 (combined attendance)	**Agency Scoping Meeting January 22, 2001**
Federal	Federal
Federal Aviation Administration (FAA)	Federal Aviation Administration (FAA)
Regional	Federal Highway Administration (FHWA)
Metropolitan Washington Airports Authority (MWAA)	National Oceanic and Atmospheric Administration (NOAA)
State	National Weather Service
Virginia Department of Transportation (VDOT)	U.S. Army Corps of Engineers (USACE)
Local	Regional
Loudoun County	Metropolitan Washington Airports Authority (MWAA)
	State
	Virginia Department of Agriculture & Consumer Services
	Virginia Department of Business Assistance
	Virginia Department of Conservation and Recreation
	Virginia Department of Environmental Quality
	Virginia Department of Transportation (VDOT)
	Local
	Fairfax County Department of Transportation
	Loudoun County Department of Economic Development
	Loudoun County Office of Transportation Services
	Town of Herndon

Discussion among the attendees raised the following issues:

- FAA had possible concerns with releasing any Dulles Airport property;
- With regard to the evaluation of the use of NOAA property, about one-third of the proposed site is being transferred to MWAA, for use as a balloon launch and a weather station, with a need for clear space for these purposes;
- Potential for effects on a county planned road (Route 717);
- The MWAA Dulles Airport land use plan should be used as a point of reference in the screening of the supplemental yards;
- Development in the runway protection zone is not recommended;
- The need to place the shop facility and tower should be placed outside of any runway protection zone; and
- Structures for replacement parking might not be allowed in certain parts of the airport, unless the structures were at least partially underground.

11.2.1.7 Advance Technical Reports Review

Technical Reports were prepared in support of the Draft EIS, and include environmental, transportation, social and economic data and evaluation to be used as the basis for Draft EIS preparation. Draft copies of the Technical Reports were distributed to local agencies in February 2002 to inform the agencies of technical data related to the project and to seek comments.

11.2.2 AGENCY COORDINATION AND COMMENTS

Coordination to support the environmental review process and the preparation of the Draft EIS, the Supplemental Draft EIS, and the Final EIS is described below.

11.2.2.1 Dulles Corridor Working Groups and Steering Committee

Working groups were convened with appropriate agency representatives to facilitate technical, operations, and financial planning for the project. In addition, executives from the project's funding partners participated in the Dulles Corridor Steering Committee, which provided oversight and policy direction for several project issues, particularly financial issues. The working groups and steering committee are discussed below.

A. Dulles Corridor Technical Working Group

Agency representatives with technical expertise participated in the Technical Working Group. Jurisdictions and agencies represented in the Technical Working Group include the VDOT, MWAA, Fairfax County, Loudoun County, Arlington County, Town of Herndon, and TRIP II (the owner of the Dulles Greenway). Six Technical Working Group meetings were held during October and November 2000 to discuss alternatives for routes, stations, and Metrorail S&I Yard locations. A Project Status Briefing was held on April 23, 2001 to present the results of initial and intermediate screening process and solicit comments from the Technical Working Group. Representatives from five agencies attended: Arlington County, Fairfax County Department of Planning and Zoning, Fairfax County Department of Transportation, Loudoun County, and VDOT. In addition, a Technical Working Group Station Site Plan Review meeting was held on July 20, 2001, and Technical Working Group meetings were held to review the status of the Draft EIS on December 11, 2001 and February 6, 2002. Technical working group meetings continued throughout the development of the EIS.

B. Dulles Corridor Operations Working Group

Representatives from Fairfax County, Loudoun County, and the MWAA participated in the development of the Draft EIS as an Operations Planning Working Group. The Operations Planning Working Group met monthly between December 2000 and June 2001 to discuss issues related to the operations of the proposed transit improvements in the Dulles Corridor, including model inputs and assumptions, headways, fares, service variables, route patterns, and facilities. The group established the service assumptions for generating travel demand model forecasts for the project.

C. Dulles Corridor Financial Working Group

Representatives from Fairfax County, Loudoun County, and MWAA also participated in the project as a Financial Working Group. The group was established to discuss project funding sources, availability, timing, allocation, and possible creation of transportation improvement tax districts. Coordination with representatives in the Financial Working Group addressed the allocation of capital costs among the jurisdictions. The group coordination efforts also facilitated discussion of the distribution of operations and maintenance costs and subsidy allocation as well as discussion of the federal funding process.

D. Dulles Corridor Steering Committee

The Dulles Corridor Task Force was established in 1998 to help the Virginia Secretary of Transportation develop transit solutions for the Dulles Corridor. This group was instrumental in advancing the project into the environmental study phase. During the preliminary engineering and environmental review study phase, a new group called the Dulles Corridor Steering Committee was established to provide oversight and direction on issues related to the project's financing and policy. A subset of the original Dulles Corridor Task Force membership, the Steering Committee is composed of the executives from each of the project's funding partners:

- Northern Virginia District Representative of the Commonwealth Transportation Board (CTB) (Steering Committee Chairman);
- DRPT Director;
- WMATA Chief Executive Officer;
- MWAA General Manager;
- Fairfax County Executive;
- Loudoun County Administrator, and
- Herndon Town Manager.

Later, members of Landowners Economic Alliance for the Dulles Extension of Rail (LEADER), the landowners group formed to support the development of a transportation improvement district in Fairfax County, and Dulles Transit Partners were added to the Committee. The CTB representative also represents the Virginia Department of Transportation on the Steering Committee.

The Steering Committee met as needed throughout the development of the EIS to discuss policy, financial planning, and management issues. As a part of this effort, the Steering Committee reviewed and discussed the proposed project phasing and modifications to the LPA during the preparation of the Supplemental EIS. The committee also identified several options for providing the nonfederal share of capital funding, built on the efforts of the Financial Working Group to determine an equitable allocation of capital and operating costs among the funding partners, as well as develop a recommended implementation schedule for the project.

11.2.2.2 Draft EIS Coordination and Review

A. Additional Coordination During Draft EIS Preparation

Throughout the environmental review process, meetings were conducted with a variety of federal, state and local agencies to address environmental issues as they surfaced. A list of the meetings conducted is included in Table 11.2-4. Agency correspondence is in Appendix K.

Table 11.2-4: Summary of Agency Coordination Meetings

Date of Meetings	Agencies Attending
June 5, 2000	Fairfax County and VDOT
July 10, 2000	Loudoun County Transportation Committee
July 17, 2000	City of Falls Church Council
July 21, 2000	MWAA
August 2, 2000	Fairfax County Dulles Corridor Land Use Task Force
August 2, 2000	Fairfax County and Developer
August 7, 2000	Fairfax County Transportation Committee
August 15, 2000	DRPT and Capital Beltway Rail Feasibility Study Consultant
August 23, 2000	Town of Herndon
August 29, 2000	Arlington County

Date of Meetings	Agencies Attending
August 30, 2000	National Park Service and Wolf Trap Foundation
September 6, 2000	Town of Herndon and Consultant
September 12, 2000	MWAA
September 19, 2000	Loudoun County
September 23, 2000	Fairfax County Planning Commission
October 2, 2000	Loudoun County Transportation Committee
October 10, 2000	MWAA
October 11, 2000	VDOT Capital Beltway Study Team
October 12, 2000	Town of Herndon and Consultant
October 20, 2000	FHWA and VDOT
October 23, 2000	Capital Beltway Rail Feasibility Study Consultant
October 27, 2000	Fairfax County and Consultant

B. Agency Review and Comments on the Draft EIS

The Draft EIS was distributed to 58 agencies for review and comment in June 2002 in advance of the July 2002 public hearings. Comments received from agencies on the Draft EIS and responses to those comments are provided in the *October 2002 Draft EIS Public Hearings Report* and the *November 2002 Draft EIS Public Hearings Report Supplement* and can be viewed in Appendix J. Agency correspondence is provided in Appendix K.

A total of 13 agencies commented on the Draft EIS. Agencies who commented are as follows:

- City of Falls Church;
- Virginia Department of Conservation and Recreation;
- Fairfax County Department of Transportation;
- Fairfax County Park Authority;
- Fairfax County;
- Federal Aviation Administration, Washington Airports District Office;
- Metropolitan Washington Airports Authority;
- U.S. Department of Agriculture, Natural Resources Conservation Service;
- Northern Virginia Regional Park Authority;
- Town of Herndon;
- U.S. Environmental Protection Agency;
- Virginia Department of Environmental Quality; and
- Virginia Department of Transportation.

Issues raised included the following:

- Air quality improvements;
- Support for Metrorail alternative;
- Service and inspection yard noise;
- Water quality;
- Wetland permitting;
- Safety concerns; and
- Parks and recreation impacts.

11.2.2.3 Supplemental Draft EIS Coordination and Review

A. Additional Coordination During Supplemental Draft EIS Preparation

Major coordination meetings with key resource, regulatory, and environmental agencies in support of the Supplemental Draft EIS are summarized below.

U.S. Army Corps of Engineers (USACE), Virginia Department of Environmental Quality (VDEQ), and the Environmental Protection Agency (EPA). The purpose of this coordination was to provide an update on the project, to discuss possible wetland mitigation measures, to review the historic and environmental impacts of construction at S&I Yard Site 15, and to introduce the Comstock Project. Discussions on wetland issues determined that impacts were minimal; therefore, mitigation at an approved wetland bank or in-lieu fee fund would be acceptable. For S&I Yard Site 15, it was agreed that further coordination with the Virginia Department of Historic Resources (VDHR) would be needed on possible archeological impacts. Further coordination was also arranged regarding responsibility for the mitigation of possible effects to the property offered for the proposed Loudoun Station development at the Route 772 Station.

Virginia Department of Historic Resources (VDHR). This coordination focused on the initiation of the Section 106 process and the Programmatic Agreement (PA), the possible historic value of S&I Yard Site 15, and the historic importance of Dulles Airport's "peekaboo" view sequence. It was determined that the Programmatic Agreement (PA) would be revised and submitted to VDHR and that the Advisory Council of Historic Preservation (ACHP) would be informed of DRPT's and WMATA's intent to enter into a PA. In addition, the peekaboo sequence along the DIAAH would be further evaluated and the limits of the airport historic district would be clarified. Ultimately, based on additional technical investigations and coordination, a Memorandum of Agreement was prepared and is available in Appendix F.

Metropolitan Washington Airports Authority (MWAA), Metropolitan Transit Police Department (MTPD), and Transportation Security Administration (TSA). A March 2003 meeting initiated discussions on security issues posed by the proposed Metrorail station at Dulles Airport. Discussions focused on a TSA sign-off on the NEPA documents as referenced by the FAA. Other topics included the need to secure the rail yard site and separate it from the airfield. TSA's primary concerns were related to security, with the focus on measures that should be taken to enhance safety at both the airport and Metrorail station. These issues were discussed further at an April 2003 meeting.

Virginia Department of Conservation and Recreation (VDCR). Correspondence from VDCR dated November 1, 2002 requested that the department's staff be provided with results of two diabase glade habitat surveys that were conducted as part of the analysis of rare, threatened, and endangered species for the Draft EIS for S&I Yard Site 15. The agency was concerned that the initial surveys were taken at a time when the seven state and globally rare plant species associated with diabase glade communities potentially located at S&I Yard Site 15 would not be flowering. In response to these concerns, two follow-up rare plant surveys were conducted in July and August 2002. The follow-up surveys were conducted at times when the rare plants would be flowering; however, no evidence of the seven rare plants was found. Both surveys indicated that there is absence of suitable habitat for the rare diabase plants at S&I Yard Site 15.

Virginia Department of Environmental Quality (VDEQ). After the publication of the Draft EIS, VDEQ requested that coordination take place in regards to 34 sites of potential concern that were not identified during the analysis of hazardous and contaminated materials for the Draft EIS. These sites are likely to contain Recognized Environmental Conditions (REC), as they include several gas stations, auto dealerships, and airport-related facilities.

Advisory Council on Historic Preservation (ACHP). Correspondence with ACHP dated June 19, 2003, included invitations to the council's staff to participate in further consultation to consider means to avoid or minimize project-related impacts to historic properties, under the requirements of Section 106 of

the National Historic Preservation Act, and request ACHP participation as a signatory to the Programmatic Agreement. After reviewing related project materials, ACHP responded in August 2003 that its participation would not be needed to resolve potential effects to historic resources.

B. Agency Review and Comments on the Supplemental Draft EIS

The Supplemental Draft EIS was distributed to 58 agencies for review and comment in October 2003 in advance of the December 2003 public hearings. Comments received from agencies on the Supplemental Draft EIS and responses to those comments are provided in the *February 2004 Supplemental Draft EIS Public Hearings Report* and the *March 2004 Supplemental Draft EIS Public Hearings Report Supplement* as well as in Appendix J of this Final EIS. Agency correspondence is provided in Appendix K.

A total of 12 agencies commented on the Supplemental Draft EIS, including:

- Northern Virginia Regional Commission;
- Commonwealth of Virginia;
- Fairfax County Non-Motorized Transportation Committee;
- Virginia Department of Environmental Quality;
- District of Columbia Department of Public Works;
- Loudoun County;
- U.S. Environmental Protection Agency;
- Northern Virginia Regional Park Authority;
- Virginia Department of Transportation;
- Fairfax County Department of Transportation;
- Metropolitan Washington Airports Authority;
- Town of Herndon; and
- Commonwealth of Virginia Department of Historic Resources.

Issues raised included bus service; roadway analysis methodology; traffic effects; parklands and recreation impacts; parking; operating costs; and project phasing.

11.2.2.4 Final EIS Coordination and Review

U.S. Army Corps of Engineers (USACE) and Virginia Department of Environmental Quality (VDEQ). As design of the project was refined, additional wetland impacts were identified with two stormwater management facilities, P-5 and P-15. A supplement to the March 2003 jurisdictional determination was obtained. Furthermore, a Federal Consistency Determination was reviewed by VDEQ (see Appendix L).

Virginia Department of Historic Resources. The primary focus of this coordination has been to obtain a determination of effect on historic resources within the Dulles Corridor and to finalize the Section 106 Memorandum of Agreement (MOA). Appendix K contains agency correspondence and Appendix F contains the Section 106 MOA.

Virginia Department of Conservation and Recreation (VDCR) and Northern Virginia Regional Park Authority (NVRPA). The primary focus of coordination with these agencies was to resolve potential effects of the W&OD Trail. The project was found not to impact the park in terms of resulting in a use under Section 4(f) or a conversion of use under Section 6(f). VDCR and NVRPA correspondence is provided in Appendix K.

11.2.2.5 Commonwealth Transportation Board and WMATA Board of Directors

As described in Chapter 1, several local deliberative bodies are responsible for making decisions during the preliminary engineering and environmental review phase of project development. One of these bodies, the CTB, is a 17-member board appointed by the Governor of Virginia. The board is primarily responsible for locating routes, approving construction contracts, creating traffic regulations, naming highways, and administering and allocating transportation funds in Virginia.

Another of these deliberative bodies is the WMATA Board of Directors, a six-member board consisting of two principal Directors from each signatory jurisdiction (Virginia, Maryland, and the District of Columbia). In addition, the board includes six alternate Directors who may act in the absence of the Principal Director. The WMATA Board is responsible for the mass transit plan for the Washington Metropolitan Area Transit Zone, which includes the Dulles Corridor.

On November 21, 2002 the WMATA Board of Directors amended the Adopted Regional System (ARS) to include the Metrorail Alternative (T6/Y15) contingent upon six conditions. On December 19, 2002, the Commonwealth Transportation Board (CTB) concurred with the WMATA Board and formally selected Metrorail Alternative (T6/Y15) as the LPA for the project. The Boards of Supervisors for Fairfax and Loudoun counties, the Town of Herndon, and MWAA also endorsed the selection. Subsequent to circulation of the Supplemental Draft EIS, the CTB in March 2004, revised the LPA to be constructed two phases – the Wiehle Avenue Extension and the full LPA. The WMATA Board in April 2004, amended its ARS for the revised LPA contingent upon seven conditions (the original six, plus a new condition), as outlined in Chapter 2 of this Final EIS.

11.3 COMMENTS AND RESPONSES

This section addresses comments received during the public and agency comment periods for the Draft EIS and the Supplemental Draft EIS. Issues raised were addressed through provision of a clarifying response or explanation, modification of the project design and configuration or incorporation of mitigation provisions, and are reflected in this Final EIS.

11.3.1 DRAFT EIS

Public agencies, elected officials, businesses, civic association representatives, interest groups, and the general public submitted 2,520 comments regarding the Dulles Corridor Rapid Transit Project during the formal public comment period that followed publication of the June 2002 Draft EIS. These comments were submitted through public hearing testimony, comment cards, letters, e-mails, written statements, or a combination thereof. Public and agency comments are provided in Appendix J. Agency correspondence is provided in Appendix K.

At the close of the comment period, statements had been received from 386 people. Each statement received was reviewed to identify the nature of the comment. Comments were entered into a comment database and tracked by both a unique number given to each commenter and by subject matter. Similar comments are grouped together and given a common response.

During the comment period for the Draft EIS, comments were received on the following issues:

Purpose and Need for the Project

- Need for rapid transit to Dulles Airport;
- Need to address traffic congestion and improve air quality;
- Regional connectivity; and
- Service to Tysons Corner Center.

Alternatives Considered

- Support for and opposition to aerial alignments;
- Support for and opposition to BRT service;
- Support for and opposition to combination Metrorail/BRT service;
- Support for and opposition to Monorail/Light Rail Transit; and
- Support for and opposition to Metrorail Alternative.

Community Impacts

- Land use planning and mixed-use development;
- Location of the Wiehle Avenue and Reston Parkway stations;
- Parking;
- Compatibility of a BRT Maintenance and Storage Facility and Metrorail S&I Yard with community land use;
- Induced development from existing employment centers;
- Impacts of connecting to the East Falls Church or West Falls Church Metrorail Station;
- Smart growth;
- Concern about the placement of parking garages;
- Adequate parking at the western terminus and the lack of parking at the proposed Route 772 Station;
- Visual effect of an aerial alignment through Tysons Corner;
- Maximizing transit oriented development and air rights development opportunities;
- Effects of increased land use densities triggered by transit improvements;
- Location of a proposed storm water management pond and a traction power substation;
- Adequacy of the analysis to determine neighborhood impacts (i.e. noise, existing residential water wells, increased traffic volumes on local streets and overflow parking);
- High density development;
- Opposition to the Hunter Mill Road Station; and
- Importance of “connectivity” to local neighborhoods and the expansion of transit within the county for those who prefer to use public transportation but cannot drive to access rapid transit.

Environmental Effects

- Noise, vibration, and visual impacts;
- Location of the Wolf Trap Farm Park Station and its designation as a special use station;
- Locations of the BRT Maintenance and Storage Facility and the Metrorail S&I Yard;
- Existing and project-related noise impacts at and near the West Falls Church Service and Inspection (S&I) Yard; and
- Proposed noise mitigation measures.

Economic Effects

- § Cost and funding;
- § Possibility of fare increases to fund an extension;
- § Possibility of increase in ad valorem taxes;
- § Need for innovative financing (i.e., through the PPTA) and concern about the adequacy and fairness of funding sources; and
- § Financial impacts of Loudoun County becoming an active member of the WMATA.

Transportation Effects

- § Congestion as a result of possible phased implementation at interim terminus;
- § Congestion as a result of construction;
- § Impact of the proposed widening of I-66 in Arlington;
- § Metrorail only through to Tysons Corner and implementing Express Bus Service to the west in Reston, Herndon and Loudoun County;
- § Impacts on the Metrorail Orange Line;
- § Traffic congestion resulting from the additional build-out of residential, retail, office and hotel uses around the station areas;
- § Support for congestion mitigation;
- § Potential traffic effects on adjacent local streets; and
- § Access to the Reston Parkway Station from all four quadrants of the interchange between Reston Parkway and the Toll Road.

General Comments

- § Coordination with other transit studies;
- § Operational flexibility;
- § Pedestrian and bicycle access to station locations;
- § Pedestrian access and overpasses;
- § Bus and pedestrian access;
- § Project schedule;
- § Enhanced bus service;
- § Feeder bus service;
- § The amount of time provided to the public for review of the Draft EIS and submission of comments;
- § Coordination with other transit studies and connectivity between the lines;
- § Support for the results of the scoping process;
- § Service design (prior to designing the tracks); and
- § Concern over Loudoun County's self-imposed prohibition to regional park-and-ride lots within transit oriented development areas, citing the need for adequate commuter parking facilities at the terminus of the system (Route 772) to maximize ridership opportunities.

Responses to comments on the Draft EIS are presented in Appendix J.

11.3.2 SUPPLEMENTAL DRAFT EIS

Public agencies, elected officials, business, civic association representatives, interest groups, and the general public submitted a total of 832 comments regarding the Dulles Corridor Rapid Transit Project during the formal public comment period that followed publication of the October 2003 Supplemental Draft EIS. These comments were submitted through public hearing testimony, comment card, letter, e-mail, written statements, or a combination thereof. Public and agency comments are provided in Appendix J. Agency correspondence is provided in Appendix K.

As of the close of the comment period, 133 people had submitted statements for the record. Each statement received was reviewed to identify the nature of the comment. Comments were entered into a comment database and tracked by both a unique number given to each commenter and by subject matter. Responses to comments have been summarized in the Public Hearings Report prepared after the hearings on the Supplemental Draft EIS. Similar comments were grouped together and answered by a single response.

During the comment period for the Supplemental Draft EIS, comments included the following issues:

Metrorail Alternative

- Support for and opposition to Metrorail Alternative;
- Support for and opposition to a No Build Alternative;
- Support for and opposition to Phased Implementation;
- Support for BRT;
- Security issues surrounding locating an emergency access shaft on airport property; and
- Immediate need for rail in Loudoun County.

Transportation Effects

- Traffic Congestion Mitigation;
- Possible traffic congestion effects of phased construction at Wiehle Avenue interim terminus;
- Impacts on the Metrorail Orange Line;
- Negative construction impacts (access to neighborhoods, and business);
- Importance of getting rail to Tysons Corner;
- Mode changes;
- Intersection improvements and traffic calming measures;
- Existing traffic congestion, particularly near Wiehle Avenue;
- Transit service from Herndon-Monroe; and
- Premium Bus Service replacing Express Bus Service.

Community Impacts

- Negative construction impacts;
- Delay of development in areas not included in the Wiehle Avenue Extension;
- Negative Effects to Tyson's Corner and Wiehle Ave.;
- Need for cooperative redevelopment;
- Traffic analysis needed on neighborhood streets;
- Negative effect on development at Tyson's East Station vicinity;
- Location and design of the station and Kiss & Ride at Tysons West; and

- Route 772 Station.

Environmental Effects

- Noise and vibration effects at S&I Yard 15;
- Noise mitigation needed around aerial segments;
- Possible locations of Traction Power Substations and Tie-Breaker Stations;
- Negative effective on Lake Anne drainage if Wiehle Ave. is widened; and
- Coordinating noise mitigation.

Economic Impacts

- Support for opposition to a possible toll increase to partially fund construction;
- Cost and funding;
- Possibility of fare increases to fund an extension;
- Possibility of increase in sales and ad valorem taxes;
- Tax assessment district for Fairfax County;
- Pedestrian, bike, and feeder bus access for transit oriented development; and
- Financial analyses in general.

General Comments

- Pedestrian and bicycle access to station locations;
- Pedestrian access and overpasses;
- Bus and pedestrian access;
- Project schedule;
- Coordination and accountability between agencies;
- Support for the public involvement process;
- Moving pedestrian access or extending platforms over roads;
- Need for two entrances at each station; and
- Modifying station/parking designs.

Responses to comments on the Supplemental Draft EIS are presented in Appendix J.

Disclosure Statement on Conflicts of Interest

Preliminary Engineering/National Environmental Policy Act (PE/NEPA) Phase of the Dulles Corridor Rapid Transit Project

I, the undersigned, am an officer/representative of a Joint Venture of **Daniel, Mann, Johnson, & Mendenhall, Inc. (DMJM)**, and **DeLeuw, Cather & Co.**, now **Parsons Transportation Group, Inc. (PTG) (Joint Venture identified as "DMJM/PTG")**, which has a Joint Venture consultant on-call architectural/engineering contract with the Washington Metropolitan Area Transit Authority (WMATA) to provide professional services for the preparation of preliminary engineering (PE), an Environmental Impact Statement (EIS) and/or financial plans of the Dulles Corridor Rapid Transit Project (Rapid Transit Project). WMATA is the local joint lead agency for the Rapid Transit Project and receives grant monies from the Federal Transit Administration (FTA), as the lead federal agency, for the PE/NEPA phase of the Rapid Transit Project.

The Council on Environmental Quality (CEQ) issued the following regulation, 40 CFR §1506.5(c) for implementing the National Environmental Policy Act of 1969 (NEPA), as amended:

> Environmental impact statements. Except as provided in Secs. 1506.2 and 1506.3 any environmental impact statement prepared pursuant to the requirements of NEPA shall be prepared directly by or by a contractor selected by the lead agency or where appropriate under Sec. 1501.6(b), a cooperating agency. It is the intent of these regulations that the contractor be chosen solely by the lead agency, or by the lead agency in cooperation with cooperating agencies, or where appropriate by a cooperating agency to avoid any conflict of interest. Contractors shall execute a disclosure statement prepared by the lead agency, or where appropriate the cooperating agency, specifying that they have no financial or other interest in the outcome of the project. If the document is prepared by contract, the responsible Federal official shall furnish guidance and participate in the preparation and shall independently evaluate the statement prior to its approval and take responsibility for its scope and contents. Nothing in this section is intended to prohibit any agency from requesting any person to submit information to it or to prohibit any person from submitting information to any agency.

In response to this Federal CEQ regulation, DMJM/PTG states that it has no financial or other interests in the outcome of the Rapid Transit Project at this time. It further agrees and affirms that it will not have any such interest until after the

issuance date of the Record of Decision for the Dulles Transit Project by FTA ("PE/NEPA Phase Period"), except as may be authorized subsequently by either i) federal statute or regulation, and WMATA approval, or ii) an approval(s) in writing by the FTA, as the lead federal agency, and/or WMATA, as the local joint lead agency, consistent with present practice, and iii) being publicly disclosed. DMJM/PTG will not gain any direct benefit such as a promise of future construction or design work on the Rapid Transit Project, nor any indirect benefits of which DMJM/PTG is aware, such as if the Rapid Transit Project would aid proposals sponsored by DMJM/PTG's other clients. If DMJM/PTG has developed initial data and plans for the Rapid Transit Project, a disclosure statement in the draft EIS will clearly state the scope and extent of the firm's prior involvement in order to disclose any potential conflicts of interest that may exist. DMJM/PTG, upon learning of any potential conflict(s) of interest in the PE/NEPA Phase Period will timely advise the FTA and WMATA in writing, and will, in the same writing, fully inform those agencies of the steps taken to eliminate the potential conflict(s).

The foregoing responsibilities and affirmation, given in this Disclosure Statement, shall cease and terminate at the time of the issuance of the Record of Decision for the Dulles Transit Project by FTA ("PE/NEPA Phase Period").

DMJM/PTG, a Joint Venture

By: _____ December 13 2000

Its: Program Manager

ACKNOWLEDGMENT

Commonwealth of Virginia)
County of Arlington) SS:

I, Mary E. Sanders, a Notary Public in and for said Commonwealth of Virginia, DO HEREBY CERTIFY that , (title) James L. Palmer, of **DMJM/PTG, a Joint Venture**, personally known to me to be the same person whose name is subscribed to the foregoing instrument as such officer/representative, appeared before me this day in person and acknowledged that he/she signed and delivered the said instrument as his/her own free and voluntary act, and as the free and voluntary act of said **DMJM/PTG, a Joint Venture**, for the uses and purposes therein.

GIVEN under my hand and notarial seal this 13 day of December, 2000.

My Commission Expires December 31, 2004

My Commission expires

Disclosure Statement on Conflicts of Interest

Preliminary Engineering/National Environmental Policy Act (PE/NEPA) Phase of the Dulles Corridor Rapid Transit Project

I, the undersigned, am an officer/representative of **Parsons Brinckerhoff Quade and Douglas, Inc. (PBQD)**, a consulting firm which has an on-call architectural/engineering contract with the Washington Metropolitan Area Transit Authority (WMATA) to provide professional services for the preparation of preliminary engineering (PE), an Environmental Impact Statement (EIS) and/or financial plans of the Dulles Corridor Rapid Transit Project (Rapid Transit Project). WMATA is the local joint lead agency for the Rapid Transit Project and receives grant monies from the Federal Transit Administration (FTA), as the lead federal agency, for the PE/NEPA phase of the Rapid Transit Project.

The Council on Environmental Quality (CEQ) issued the following regulation, 40 CFR §1506.5(c), for implementing the National Environmental Policy Act of 1969 (NEPA), as amended:

> Environmental impact statements. Except as provided in Secs. 1506.2 and 1506.3 any environmental impact statement prepared pursuant to the requirements of NEPA shall be prepared directly by or by a contractor selected by the lead agency or where appropriate under Sec. 1501.6(b), a cooperating agency. It is the intent of these regulations that the contractor be chosen solely by the lead agency, or by the lead agency in cooperation with cooperating agencies, or where appropriate by a cooperating agency to avoid any conflict of interest. Contractors shall execute a disclosure statement prepared by the lead agency, or where appropriate the cooperating agency, specifying that they have no financial or other interest in the outcome of the project. If the document is prepared by contract, the responsible Federal official shall furnish guidance and participate in the preparation and shall independently evaluate the statement prior to its approval and take responsibility for its scope and contents. Nothing in this section is intended to prohibit any agency from requesting any person to submit

information to it or to prohibit any person from submitting information to any agency.

In response to this Federal CEQ regulation, PBQD states that it has no financial or other interests in the outcome of the Rapid Transit Project at this time. It further agrees and affirms that it will not have any such interest until after the issuance date of the Record of Decision for the Dulles Transit Project by FTA ("PE/NEPA Phase Period"), except as may be authorized subsequently by either i) federal statute or regulation, and WMATA approval, or ii) an approval(s) in writing by the FTA, as the lead federal agency, and/or WMATA, as the local joint lead agency, consistent with present practice, and iii) being publicly disclosed. PBQD will not gain any direct benefit such as a promise of future construction or design work on the Rapid Transit Project, nor any indirect benefits of which PBQD is aware, such as if the Rapid Transit Project would aid proposals sponsored by PBQD's other clients. If PBQD has developed initial data and plans for the Rapid Transit Project, a disclosure statement in the draft EIS will clearly state the scope and extent of the firm's prior involvement in order to disclose any potential conflicts of interest that may exist. PBQD, upon learning of any potential conflict(s) of interest in the PE/NEPA Phase Period will timely advise the FTA and WMATA in writing, and will, in the same writing, fully inform those agencies of the steps taken to eliminate the potential conflict(s).

The foregoing responsibilities and affirmation, given in this Disclosure Statement, shall cease and terminate at the time of the issuance of the Record of Decision for the Dulles Transit Project by FTA ("PE/NEPA Phase Period").

Parsons Brinckerhoff Quade and Douglas, Inc. (PBQD)

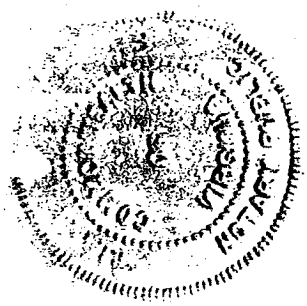
By: _____ December 8, 2000

Its: John N Rever

ACKNOWLEDGMENT

Commonwealth of Virginia)
County of _____) SS:

I, Mary E. Sanders, a Notary Public in and for said Commonwealth of Virginia, DO HEREBY CERTIFY that , (title) John N Rever, VP, of **Parsons Brinckerhoff Quade and Douglas, Inc. (PBQD)**, personally known to me to be the same person whose name is subscribed to the foregoing instrument as such officer/representative, appeared before me this day in person and acknowledged that he/she signed and delivered



the said instrument as his/her own free and voluntary act, and as the free and voluntary act of said **Parsons Brinckerhoff Quade and Douglas, Inc.**, the uses and purposes therein.

GIVEN under my hand and notarial seal this 8 day of December, 2000.

My Commission Expires December 31, 2004

Notary Public
Mary Sanders

My Commission expires:

APPENDIX C: GLOSSARY OF TERMS

100-year floodplain – The areas along or adjacent to a stream or body of water that are capable of storing or conveying floodwaters during a 100-year frequency storm event.

A-Weighted Sound Level (A-Weighted Scale) – Decibel measurements in the "A" scale; a method of representing the human ear's interpretations of the loudness of an equal sound level throughout the audible frequency range.

Adopted Regional System (ARS) - WMATA's approved transit system.

Active park – A park where the primary focus is active recreation such as organized sports or other non-noise sensitive uses, such as playgrounds and recreation centers.

Alight – to depart a transit vehicle.

Ambient background noise – The existing cumulative noise that is characteristic of an area based on current activity levels.

Americans with Disabilities Act of 1990 (ADA) – Federal legislation that proscribes standards to meet the needs of individuals with disabilities in public accommodations, employment, transportation, state and local government services, and telecommunications.

Area of Potential Effects (APE) – For purposes of complying with Section 106 of the National Historic Preservation Act, a geographic area or areas where an undertaking (e.g., the Dulles Corridor Rapid Transit Project) may directly or indirectly cause alterations in the character or use of historic properties, if any such properties are located in the area of the project.

Arterial – A roadway designed to connect two distant areas at higher speeds and higher capacity travel than a local road.

At-grade – Level with the ground surface.

Backwater – A section of a stream where water accumulates behind a blockage.

Baseline Alternative – See No Build Alternative.

Benthic macro-invertebrate – An aquatic animal lacking a backbone that inhabits the bottom of an aquatic environment.

Bent – A structure with an upside-down U-shape used to support an aerial transit guideway or an aerial roadway when ground conditions preclude the use of regular supports, such as when there is a roadway below.

Best available control technologies (BACT) – Mitigation measures utilizing the best available equipment to minimize noise and vibration impacts at nearby receptors, typically used during construction activities.

Best management practices (BMPs) – Specific standards utilized during construction to minimize the impact on surrounding resources.

Business Professional and Occupancy License revenues (BPOL revenues) - Revenues that typically form part of a county's General Fund.

Build Alternative(s) – The alternative(s) being evaluated as the proposed action during the EIS process.

Building attenuation – The reduction in the energy of a sound field (i.e. noise) resulting from its passage through a building's structural elements.

Bus Rapid Transit (BRT) – An emerging technology in which buses are used to provide high-quality transit service akin to a rapid rail system.

BRT maintenance and storage facility – Facility with multiple buildings for the maintenance and storage of out-of-service BRT vehicles. Also includes exterior parking spaces for storing buses and surface parking for employees as well.

Central business district (CBD) – The main concentration of office and commercial development in a city. Typically corresponds to the main financial district. Also called the "core" or "downtown."

Champion tree - The largest tree of its species that occurs within a given jurisdiction.

Channel morphology – The dimension, pattern, and profile of the stream channel.

Channel substrate – Particles on the streambed, both organic and inorganic.

Clean Air Act of 1970 – Legislation mandating the U.S. EPA to set national air quality standards to protect the public against common pollutants. State governments are required to devise clean-up plans to meet these U.S. EPA standards.

Congestion Mitigation and Air Quality (CMAQ) – authorized under the Intermodal Surface Transportation Equity Act (ISTEA), this law provided $6.0 billion in funding for surface transportation and other related projects that contribute to improvements in air-quality and reduce congestion.

Commonwealth Transportation Board (CTB) – A seventeen-member board appointed by the Governor of Virginia that is primarily responsible for locating routes, approving construction contracts, creating traffic regulations, naming highways, and administering and allocating transportation funds in Virginia.

Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) – Commonly known as Superfund, this law was passed in 1980 to create a tax on the chemical and petroleum industries and provide broad federal authority to respond directly to releases or hazardous substances that may endanger public health or the environment.

Comprehensive Plan – Each jurisdiction in the Commonwealth of Virginia is required by state law to institute a comprehensive plan to be used as a guide to decision-making about the natural and built environment.

Conformity – A designation given to transportation plans, programs, and projects that conform to federally mandated state air-quality plans.

Constrained Long-Range Plan (CLRP) – A long-term plan for transportation projects in the Washington metropolitan region with a 25-year horizon from 2001 to 2025. It is constrained to include only those projects that can be funded by revenues that are "reasonably expected to be available" as required by federal law and regulations. It includes both transit and highway projects, and meets federal planning and air-quality conformity requirements.

Council on Environmental Quality (CEQ) - Established in the Executive Office as part of the National Environmental Policy Act of 1969 (NEPA), the council coordinates federal environmental efforts, policies, and initiatives, and ensures that federal agencies meet NEPA requirements.

Cut-through traffic impacts – Impacts caused by traffic using residential streets rather than the local street system intended for through traffic.

Decibel (dBA) – A unit of measure of sound pressure used to describe the loudness of sound on the A-weighted scale (see A-Weighted Sound Level) .

Decision-makers – The Virginia Commonwealth Transportation Board and the Board of Directors of the Washington Metropolitan Area Transit Authority, which, in similar actions, selected and revised the Locally Preferred Alternative.

Diabase – A hard dark-colored igneous rock, found primarily in northern Virginia counties. The bedrock supports a distinctive community type of drought-tolerant plants.

Easement – A right afforded by a property owner for another to make limited use of his or her property.

Environmental Impact Statement (EIS) – A comprehensive study of potential environmental impacts related to federally assisted projects. Projects for which an EIS is required are defined in the National Environmental Policy Act of 1969, as amended.

Federal Transit Administration (FTA) – The agency of the U.S. Department of Transportation responsible for regulation and funding of public transportation.

Fixed-guideway – A track or other riding surface that supports and physically guides transit vehicles designed to travel exclusively on that surface.

Flex – Flexible, able to be used for many purposes. For example, "flex industrial building" may be used to house several uses such as light industrial, office space, audio stores, etc.

Floor-area-ratio (FAR) – The ratio of a building's floor area to the area of the parcel the building is located on used as a measure of the density of building on a parcel and is used to regulate development.

Flyover bridge – A highway ramp that passes above and across traffic lanes.

Federal Reimbursement Anticipation Note (FRAN) - the Virginia Transportation Act of 2000 created the Priority Transportation Fund and authorized the Commonwealth Transportation Board (CTB) to issue Federal Reimbursement Anticipation Notes (FRANs) in the maximum aggregate principal amount of $1.2

billion outstanding at any one time. FRANs are a revolving line of credit used by the Commonwealth to fund construction of transportation improvements.

Full Funding Grant Agreement (FFGA) - funding mechanism established by Congress to support the multi-year capital needs of transit project construction. These funding commitments are made after costs, benefits, and impacts are most accurately known and project sponsors have demonstrated the technical and financial capacity to build and operate the project. By law, the FTA negotiates the details of FFGAs with project sponsors, including an annual schedule of when funds will be provided. Once FFGAs are executed, Congress appropriates funding for the project on an annual basis.

General Plan – The term used for a county's comprehensive plan. See Comprehensive Plan for additional information.

Geographic Information Systems (GIS) – A system of computer software and hardware, data, and personnel to manipulate, analyze and present geographically referenced information or data that is identified according to their locations.

General Obligation Bond (GO Bonds) – A type of Municipal Bond for which principal and interest are secured by the full faith and credit of the issuer and usually supported by either the issuer's unlimited or limited taxing power.

Grade-separated – Used to describe an alignment that is elevated or below ground, or crossings that use an overpass or an underpass. Grade separation allows traffic or transit vehicles to pass through intersections without stopping for opposing traffic. Heavy rail transit such as the Metrorail system must be grade-separated because it uses a high-voltage third rail.

Ground-borne vibration and noise– The vibration-induced levels that propagate over ground between the source and a receptor such as a building; typically assessed indoors.

Groundwater recharge – A process of replenishment (recharge) of water to an aquifer (a rock formation that has properties favorable for storage of water).

Headway – The time interval between vehicles moving in the same direction on a particular route; also called service frequency.

High-Occupancy Vehicle (HOV) – A vehicle occupied by more than one person; used to distinguish between vehicles that only have a single-occupant (the driver) and vehicles that include passengers as well.

Hertz (Hz) – Frequency measured in cycles per second

Inches per second (ips) – Vibration velocity levels are typically expressed in terms of inches per second.

Indefinite association – Used to describe the relationship between an archeological artifact and the location in which it is found when the location may not be the same location where the artifact was last used.

Infill development – Development of vacant or under-used parcels within existing urban areas that are already largely developed.

Jurisdictional determination (JD) – Regulatory review of previously identified wetlands and waters of the U.S. by the Army Corps of Engineers in compliance with Section 404 of the Clean Water Act.

Keynote Employment Centers – A designation in the Loudoun County General Plan for office or research-and-development centers supported by ancillary services for employees.

Kiss & Ride – Drop off/pick up areas at transit stations in the Metro system.

L10 noise level – The level of noise at which the A-weighted sound pressure level in decibels is exceeded 10 percent of the time.

L90 noise level – The level of noise at which the A-weighted sound pressure level in decibels is exceeded 90 percent of the time.

Layover facility – Facility used for short-term storage of revenue vehicles between scheduled trips.

Ldn – The day-night noise level, represents the average noise level evaluated over a 24-hour period. A 10-decibel penalty is added to events that occur during the nighttime hours (10:00 P.M. to 7:00 A.M.) to account for people's increased sensitivity to noise while they are sleeping.

Lmax – The maximum noise level that occurs during an event or train passby and is the noise level actually heard during the event or passby.

Leq noise level – The level of constant noise which contains the same amount of acoustic energy as time-varying noise levels (e.g. traffic noise) during a given time interval.

Land use – Classification providing information on land cover and the types of human activity occuring on a parcel of land, such as "commercial," "industrial," "residential," or "open space."

Level of Service (LOS) – A letter grade designation used to describe given roadway conditions with "A" being at or close to free-flow conditions and "F" being at or close to over-saturation of the roadway; usually based on the progression of vehicles through the green phase of a signal, driver discomfort/frustration, lost travel time, and fuel consumption.

Light Rail Transit (LRT) – A rail technology that can operate in rights-of-way that are not grade-separated usually powered electrically by overhead catenary lines.

Locally Preferred Alternative (LPA) – The alternative selected by local decision-makers as the preferred solution to the corridor's identified needs. The full LPA is the 23.1-mile Metrorail extension in the Dulles Corridor.

Magnetic levitation – An emerging technology in which magnetic forces are used to lift or levitate a vehicle and then propel and guide it along a track with cruising speeds up to 300 miles per hour; also called maglev.

Mainline – The revenue service tracks on a rail line (the main service line), rather than auxiliary tracks (such as pocket tracks, crossovers, or maintenance tracks) or tracks providing a connection to a maintenance and storage facility.

Major Investment Study (MIS) – An alternatives analysis study process for proposed transportation investments in which a wide range of alternatives is examined to produce a smaller set of alternatives that

best meet project area transportation needs. The purpose of the study is to provide a framework for developing a package of potential solutions that can then be further analyzed during an Environmental Impact Statement (EIS) process.

Memorandum of Agreement (MOA) – A document that describes the terms and conditions agreed upon to resolve the potential adverse effects of a federal agency program, under Section 106 of the National Historic Preservation Act.

Metropolitan Washington Airports Authority (MWAA) – The Authority responsible for operating and maintaining Washington Dulles International and Ronald Reagan Washington National airports.

Metrorail Service and Inspection Yard (S&I Yard) – Yard that includes multiple buildings for light and heavy-duty maintenance of rail cars and for storage of out-of-service rail cars. Includes multiple tracks for moving and storing rail cars and parking for employees.

Mitigation banking - The restoration, creation, enhancement, and preservation of wetlands and/or other aquatic resources, for the purpose of providing compensatory mitigation in advance of authorized impacts to similar resources.

Mixed-use – Combination of land uses, such as residential uses combined with office, retail, public, entertainment, or even manufacturing uses.

Monorail – A transit mode consisting of automated transit vehicles that operate on or are suspended from a single rail, beam, or tube.

Monumentation – A type of signage for a development or business.

National Environmental Policy Act of 1969 (NEPA) - requires federal agencies to consider the environmental impacts of major federal projects or decisions, to share information with the public; to identify and assess reasonable alternatives; and to coordinate efforts with other planning and environmental reviews taking place.

National Historic Landmark (NHL) – A designation denoting a historic properties on the National Register that are of particular significance.

National Register of Historic Places (NRHP) – The official list of the nation’s cultural resources worthy of preservation.

New Starts – A category of federal funding for major transit “fixed guideway” capital investments.

No Build Alternative - For the Dulles Corridor Rapid Transit Project, the No Build Alternative was consistent with the "no-action alternative" required by the Council of Environmental Quality's regulations for implementing the National Environmental Policy Act of 1969, as amended, and provided a baseline for comparison against which the other alternatives were evaluated in the EIS. The No Build Alternative included existing highway and public transportation infrastructure in the Dulles Corridor, and transportation system improvements that were included in the Washington metropolitan region's constrained long-range transportation plan and committed to be implemented by 2025, aside from the Dulles Corridor Rapid Transit Project.

Noise Abatement Criteria (NAC) – Noise levels established by FHWA for various activities. When predicted noise levels approach or exceeds the NAC level, mitigation must be considered.

Non-revenue service hours – The time during which buses run between the storage facility and the beginning of the route and vice versa.

Off-peak travel hour – An hour of a 24-hour day when traffic is less than the maximum observed for the same 24-hour period.

Operating and maintenance (O&M) costs – Costs associated with operating and maintaining transit service, including vehicle operators, fuel, vehicle maintenance, and infrastructure (stations, tracks, right-of-way) maintenance.

Order of magnitude cost – A general cost figure used for comparative purposes.

Paratransit service – Demand-responsive service geared toward physically impaired passengers such as elderly and handicapped.

Park-and-ride facility – A parking facility that is part of a transit facility; an access mode for patrons to drive private vehicles to a transit facility.

Passive park – A park where the primary focus is low-impact, quiet recreation, including hiking, meditation, and nature study.

Peak particle velocity (PPV) – Expressed in units of ips, PPV represents the maximum instantaneous vibration velocity observed during an event. Typically used to evaluate the potential for damage to buildings.

"Peekaboo" sequence – Used to characterize the approach to Washington Dulles International Airport as designed by airport architect Eero Saarinen. Designed to provide a variety of views at different points of the approach to create a sense of dramatic expectation.

People-mover system – Typically automated rail systems that use passenger vehicles operating singly or in multi-car trains. The guideway for this mode must be grade-separated.

Personal Rapid Transit (PRT) – Typically envisioned as a fixed-guideway transit mode using small, low-capacity vehicles (one to four persons) designed to function like an automobile in an urban setting.

Platform hours – The daily total of the time a vehicle is in operation. This total includes a vehicle's revenue service hours and non-revenue service hours.

Platoon – In reference to BRT vehicles, two-vehicle "bus trains" in which the two vehicles run in tandem, though not physically connected like rail cars.

Pocket track – Track that is located between the main tracks and are used to store out-of-service trains and equipment.

Portal – Entrance into a Metrorail tunnel segment.

Preliminary Information Form (PIF) – A form that can precede the completion of a National Register Nomination Form to determine whether a property or district warrants more detailed documentation for nomination.

Proffer – A voluntary fee (or the provision of capital improvements in lieu of a fee) paid by a developer to a jurisdiction in return for a change in the zoning of an parcel of land.

Profile – The vertical alignment of a transit alignment, which typically shows the elevation of the alignment as it relates to ground level.

Project Team – The staffs of the Virginia Department of Rail and Public Transportation and of the Washington Metropolitan Area Transit Authority, which together made recommendations to the decision-makers, the Commonwealth Transportation Board and WMATA Board of Directors.

Public-private partnership – An innovative procurement process for private organizations to partner with public agencies to design, build, finance, and possibly own transportation infrastructure established under Virginia's 1995 Public-Private Transportation Act.

Record of Decision (ROD) –The final step in the EIS process under NEPA. Documentation of the lead federal agency's formal decision on the proposed action. This document constitutes the basis for the federal agency's environmental finding on the project.

Regolith – The layer of loose rock resting on bedrock, constituting the surface of most land.

Resource Protection Area(s) (RPA) – Land(s) at or near the shoreline that have an intrinsic water quality value due to the ecological and biological processes they perform or are sensitive to impacts that may result in significant degradation to the quality of state waters.

Revenue service hours – The time during which buses pick up and transport passengers.

Right-of-way – Land available for operation of transportation facilities (roadways or transit lines). The land is typically government-owned (local, state, or federal). A transportation facility may occupy all or a portion of the right-of-way. Rights-of-way can be grade-separated or at-grade.

Root mean square (RMS) – The square root of the average of the squares of a set of numbers. To more accurately describe the human response to vibration, the root mean square (RMS) amplitude is used to assess impacts.

Schist – A medium- to coarse-grained, foliated metamorphic rock composed of laminated, often flaky parallel layers. Compositional layering may or may not be present.

Scoping – An early public discussion of the scope of issues related to a proposed federal action.

Secondary containment systems – Best Management Practices designed to enhance water quality. Examples include stormwater management ponds and oil/water separators.

Shovel test pit – A hole, typically round and one foot in diameter, excavated with a shovel through soil layers. Archaeologists use shovel test pits spaced at regular intervals to identify the presence of archaeological deposits or sites.

Single-Occupant Vehicle (SOV) – Privately operated vehicles whose only occupant is the driver.

Slip ramp – At-grade ramps that allow access to a barrier-restricted facility. For example, in the Dulles Corridor, there are several short, at-grade ramps that allow access between the Dulles Toll Road and the Dulles Airport Access Road.

Soft costs – In a project budget, allowances for engineering and management, project insurance, and agency costs.

Sound exposure level (SEL) – An indicator of the cumulative exposure to noise from a single sound event. SEL normalizes the time period of the Leq to one second allowing for the direct comparison of events or passbys with different time durations.

State Historic Preservation Officer (SHPO) – A person designated and appointed by the state governor to administer the State Historic Preservation Program, and the office of professional staff supporting the program.

Stormwater management pond(s) (SWMP) – A best BMP designed to enhance stormwater quality by slowing the velocity of runoff, thereby settling sediment and potential contaminants.

Tabular aquifer – An aquifer that is more or less continuous, but hydraulic connection across confining units and between individual aquifers is poor.

Tail track - Track (typically at end of line) used for storage of trains during operating hours. Sometimes used for reversing the direction of trains at the end of the line.

Tie-breaker stations – Facilities that break the rail power line into sections, allowing power in one or more sections to be shut down for maintenance without affecting the power supply to the rest of the system.

Topography – The surface features of a place or region.

Traction Power Substations – Facilities that convert alternating current power supplied by the power company into direct current power for the rail system.

Traffic Analysis Zone (TAZ) – The smallest geographically designated area for analysis of transportation activity.

Transit-Oriented Development (TOD) – A land use designation intended to encourage the use of transit. Measures employed in areas with TOD designations include increased densities, clustered development, pedestrian amenities, parking restrictions, and urban design enhancements.

Transit-related employment center (TREC) –The transit node designated near Route 606 by the Loudoun County Revised General Plan in which increased development is permitted based on the implementation of BRT or Metrorail. Because of its proximity to Dulles International Airport, the TREC does not permit residential development.

The Transportation Infrastructure Finance and Innovation Act of 1998 (TIFIA) - Established a new federal credit program under which the U.S. Department of Transportation may provide three forms of credit assistance – secured (direct) loans, loan guarantees, and standby lines of credit – for surface transportation projects of national or regional significance.

Transportation management agency (TMA) – Nonprofit, public-private partnership that works to improve transportation mobility in a region.

Transportation system management (TSM) – Low-cost, operationally oriented transit improvements. The TSM Alternative provides the baseline against which the cost-effectiveness of capital investments in the Build Alternatives can be evaluated.

Vehicle passby – an event whereby a vehicle passes a reference point.

Vehicle miles traveled (VMT) – on highways, the measurement of the total miles traveled by all vehicles in an area for a specified time period.

Vibration decibel (VdB) – The RMS velocity is expressed in inches per second (ips) or vibration decibels (VdB). Vibration levels in VdB are referenced to 1 micro inch per second (mips).

Virginia Department of Rail and Public Transportation (DRPT) – The agency that supports rail and public transportation systems in the Commonwealth of Virginia through funding programs, advocacy and technical support. DRPT is the owner and sponsor of the Dulles Corridor Rapid Transit Project.

Virginia Public-Private Transportation Act of 1995 (PPTA) – The legislative framework enabling the Commonwealth of Virginia, qualifying local governments and certain other political entities to enter into agreements authorizing private entities to acquire, construct, improve, maintain, and/or operate qualifying transportation facilities. The public entities may either solicit or accept unsolicited proposals from private sources.

Washington & Old Dominion (W&OD) Railroad Regional Park – A 45 mile-long, 100-foot wide recreational trail and parkland stretching from Arlington County to Loudoun County, Virginia.

Washington Metropolitan Area Transit Authority (WMATA) – The agency that plans, builds, operates, and maintains the Washington D.C. metropolitan region's Metrorail and Metrobus transit systems.

Wiehle Avenue Extension – Formerly known as LPA Phase 1, the Wiehle Avenue Extension connects to the existing Metrorail Orange Line between West Falls Church and East Falls Church Stations and would extend to Wiehle Avenue. It is anticipated that it will begin operations in 2011.

Welfare facility – Support facilities for operators of revenue vehicles. Typically includes one or more of the following: kitchen/lunchrooms, locker rooms, rest rooms, quiet rooms.

Yard lead - Track that connects the mainline to the service and inspection yard.

APPENDIX D: ACRONYMS

ACHP	Advisory Council for Historic Preservation
ADAAG	Americans with Disabilities Act Accessibility Guidelines
APE	Areas of Potential Effect
ARS	Adopted Regional System
BACT	Best Available Control Technologies
Bbl	Barrel of Fuel/Oil
BMPs	Best Management Practices
BPOL	Business Professional and Occupancy License revenues
BRT	Bus Rapid Transit
BTU	British Thermal Unit
CBD	Central Business District
CBPA	Chesapeake Bay Preservation Areas (Fairfax County)
CEQ	Council on Environmental Quality
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act
CLRP	Constrained Long-Range Plan
CMAQ	Congestion Mitigation and Air Quality
CO	Carbon Monoxide
CTB	Commonwealth Transportation Board
DIAAH	Dulles International Airport Access Highway
DAAR	Dulles Airport Access Road
dBA	A-Weighted Decibels

DRPT	Virginia Department of Rail and Public Transportation
EDR	Environmental Data Report
EIS	Environmental Impact Statement
EPA	Environmental Protection Agency
EQC	Environmental Quality Corridors
FAA	Federal Aviation Administration
FBI	Federal Bureau of Investigation
FFGA	Full Funding Grant Agreement
FHWA	Federal Highway Administration
FINDS	Facility Index System/Facility Identification Initiative
FRAN	Federal Reimbursement Anticipation Note
FTA	Federal Transit Administration
FY	Fiscal Year
GIS	Geographic Information Systems
HOV	High-Occupancy Vehicle
IDA	Intensely Developed Areas
LOS	Level of Service
LPA	Locally Preferred Alternative
LRT	Light Rail Transit
LUST	Leaking Underground Storage Tank
MIS	Major Investment Study
MOA	Memorandum of Agreement
MTPD	Metropolitan Transit Police Department
MWAA	Metropolitan Washington Airports Authority
MWCOG	Metropolitan Washington Council of Governments
NAAQS	National Ambient Air Quality Standards

NAC	Noise Abatement Criteria
NEPA	National Environmental Policy Act of 1969, as amended
NFPA	National Fire Protection Association
NHL	National Historic Landmark
NOAA	National Oceanic and Atmospheric Administration (NOAA)
NRHP	National Register of Historic Places
NVRPA	Northern Virginia Regional Park Authority
NVTC	Northern Virginia Transportation Commission
O/D	Origin/Destination Pair(s)
O&M	Operations and Maintenance
PA	Programmatic Agreement
PDC	Planned Development Commercial
PPTA	Public-Private Transportation Act of 1995
PRC	Planned Residential Community
RECs	Recognized Environmental Conditions
RPA	Resource Protection Area
ROD	Record of Decision
RSCOD	River and Stream Corridor Overlay Districts (Loudoun County)
RTE	Rare, Threatened, and Endangered (species)
S&I	Service and Inspection
SAP	System Access Program
SEP	System Expansion Program
SHPO	State Historic Preservation Officer
SIP	State Implementation Plan
SOV	Single-Occupant Vehicle
TDM	Transportation Demand Management

TEA-21	Transportation Equity Act for the 21st Century
TIFIA	Transportation Infrastructure Finance and Innovation Act
TIP	Transportation Improvement Program
TMA	Transportation Management Association
TOD	Transit-Oriented Design
TREC	Transit Related Employment Center
TRIP II	Toll Road Investors Partnership II
TSA	Transportation Security Administration
TSM	Transportation System Management
USACE	U.S. Army Corps of Engineers
USDOT	U.S. Department of Transportation
USEPA	U.S. Environmental Protection Agency
UST	Underground Storage Tank
VdB	Decibels of Vibration Velocity
VDCR	Virginia Department of Conservation and Recreation
VDEQ	Virginia Department of Environmental Quality
VDHR	Virginia Department of Historic Resources
VDOT	Virginia Department of Transportation
VMT	Vehicle Miles Traveled
VPDES	Virginia Pollutant Discharge Elimination System
VRE	Virginia Railway Express
W&OD	Washington and Old Dominion (Trail)
WMATA	Washington Metropolitan Area Transit Authority
YOE	Year of Expenditure

MEMORANDUM OF AGREEMENT

**AMONG THE FEDERAL TRANSIT ADMINISTRATION,
VIRGINIA DEPARTMENT OF HISTORIC RESOURCES, AND
VIRGINIA DEPARTMENT OF RAIL AND PUBLIC TRANSPORTATION,**

**CONCERNING THE EFFECTS OF
THE DULLES CORRIDOR METRORAIL PROJECT ON
HISTORIC AND ARCHAEOLOGICAL RESOURCES**

WHEREAS, the Virginia Department of Rail and Public Transportation (DRPT) proposes to construct, in phases, the Dulles Corridor Metrorail Project (Project) in Fairfax and Loudoun Counties, Virginia, a 23.1 mile extension of the existing regional Metrorail system as shown in Exhibit A. Project elements will include an electrically-powered rapid rail transit line operating in an exclusive right-of-way with at-grade, aerial, and subway sections, stations and parking facilities, new and improved yard and shop facilities, and ancillary facilities for the distribution of electrical power and stormwater management; and

WHEREAS, DRPT has applied to the Federal Transit Administration (FTA) for financial assistance in designing and constructing the first phase of the Project (*Extension to Wiehle Avenue*), which will extend from the existing Metrorail Orange Line near the West Falls Church Station and terminate at Wiehle Avenue in Reston, and plans to apply for separate FTA funding for the subsequent extension west of Wiehle Avenue to Dulles International Airport and eastern Loudoun County (*Extension to Dulles Airport/Route 772*). FTA has determined that the Project will constitute a federal undertaking pursuant to 36 CFR 800.3(a) if FTA financial assistance is provided; and

FTA is the lead federal agency pursuant to the National Environmental Policy Act of 1969 (NEPA, 42 USC §§4321 et seq.) and is responsible for compliance with Section 106 of the National Historic Preservation Act (NHPA) of 1966 (Section 106, 16 USC §470f).

WHEREAS, FTA and the Federal Aviation Administration (FAA), whose approval is required for any change in the use of land at Washington Dulles International Airport for the Project, have agreed that the FTA will serve as the lead Agency Official who shall act in cooperation with the FAA in fulfilling their collective responsibilities under Section 106; and

WHEREAS, FTA and the Metropolitan Washington Airports Authority (MWAA), as the lessee and operator of Washington Dulles International Airport, have agreed that the FTA will serve as the lead Agency Official who shall act in cooperation with MWAA in fulfilling their collective responsibilities under Section 106; and

WHEREAS, FTA has consulted on the Project with DRPT and the Virginia Department of Historic Resources, which is the State Historic Preservation Office (SHPO) for Virginia, pursuant to Section 106 and its implementing regulations at 36 CFR 800 (FTA, DRPT and the SHPO are the “required signatories”); and

WHEREAS, FTA, in consultation with the SHPO, has determined the Area of Potential Effects (APE) for the Project, as defined in 36 CFR 800.16(d), as shown in Exhibit B and has completed the identification and evaluation of historic resources within the APE; and

WHEREAS, the FTA, in consultation with the SHPO, has determined that the *Extension to Wiehle Avenue* phase of the Project will not adversely affect historic properties; and

WHEREAS, the FTA, in consultation with the SHPO, has determined that the *Extension to Dulles Airport/Route 772* phase of the Project will have an adverse effect, as defined in 36 CFR 800.5(a), on the Washington Dulles International Airport historic district shown in Exhibit C, which is eligible for the National Register of Historic Places (National Register), by altering the remaining historic "peekaboo" views of the main terminal control tower for approaching travelers from the Dulles International Airport Access Highway (DIAAH); and

WHEREAS, the FTA, in consultation with the SHPO, has determined that the Project will not affect archaeological properties; and

WHEREAS, FTA and DRPT have informed and involved the public in Section 106 review through public NEPA scoping meetings held in July 2000, public information meetings held in January 2001, public hearings on the Draft Environmental Impact Statement (EIS) held in July 2002 and on the Supplemental Draft EIS held in December 2003, and through additional informal meetings and outreach materials, pursuant to 36 CFR 800.2(d), and has specifically invited comments on the Section 106 process; and

WHEREAS, the FAA has been invited to concur in this Agreement; and

WHEREAS, MWAA has been invited to concur in this Agreement; and

WHEREAS, the Washington Metropolitan Area Transit Authority (WMATA), as the operator and future owner of the Project's facilities, has been invited to concur in this Agreement; and

WHEREAS, Fairfax and Loudoun counties, have participated in the Section 106 consultation and have been invited to concur in this Agreement; and

WHEREAS, the Advisory Council on Historic Preservation has been invited to participate in the Section 106 process for this Project and has declined; and

WHEREAS, the Virginia Council on Indians has been invited to participate in the Section 106 process for this Project and has declined; and

WHEREAS, FTA's decision to fund each phase of the Project for design and construction will be made independently in accordance with its regulations on major capital investment projects (49 CFR 611) and any stipulations specific to a particular Project phase are not applicable until FTA financial assistance is provided; and

NOW, THEREFORE, the FTA and the SHPO agree that upon FTA's decision to proceed with a particular phase of the undertaking, the FTA shall ensure that the following stipulations are implemented in order to take into account the effects of the undertaking on historic properties and that these stipulations shall govern the Project and all of its parts until this Agreement expires or is terminated.

STIPULATIONS

1. Unanticipated Discovery

A. Historic Properties

In the event that unanticipated effects on historic properties are found during the implementation of this Agreement, DRPT will stop any work that may adversely affect the historic property or that may foreclose opportunities to avoid such adverse effects. FTA shall consult with the SHPO and with the other required and concurring signatories to this Agreement, as appropriate, to determine the appropriate course of action to comply with Section 106. If necessary, the required signatories shall review the terms of this Agreement and determine whether revisions are needed. Any revisions to the Agreement shall be made in accordance with Stipulation 5 below.

B. Archaeological Resources

1. In the event that a previously unidentified archaeological resource is discovered during ground disturbing activities, DRPT will halt all construction work involving subsurface disturbance in the area of the resource and in the surrounding area where further subsurface deposits may reasonably be expected to occur. An archaeologist meeting the Secretary of the Interior's *Professional Qualifications Standards* (36 CFR 61) will immediately inspect the work site and determine the extent and the nature of the affected archaeological property. The archaeologist may consult the SHPO and other parties as deemed appropriate by the archaeologist in setting the boundaries of the archaeological resource. Construction work may then proceed in the Project area outside of the site area.

2. Within two (2) working days of the discovery, DRPT shall notify FTA and the SHPO. The notification shall describe DRPT's assessment of the National Register eligibility of the property and proposed actions to resolve the adverse effect (if any). The SHPO shall respond within two (2) working days of notification and construction may resume when the SHPO agrees. DRPT shall take into account the SHPO's recommendations regarding National Register eligibility and proposed actions, and then carry out appropriate actions. DRPT shall provide SHPO with a report of these actions once they are complete.

3. If the resource is determined to meet the National Register Criteria (36 CFR Part 60.6), FTA shall ensure compliance with Section 800.13 of the Council's regulations.

C. Human Remains

DRPT will ensure that human remains and associated funerary objects encountered during the course of actions taken as a result of this Agreement shall be treated in a manner consistent with the provisions of the *Virginia Antiquities Act*, Section 10.1-2305 of the *Code of Virginia*, final regulations adopted by the Virginia Board of Historic Resources and published in the Virginia Register on July 15, 1991. In addition, human remains and associated funerary objects that may be of Native American origin, encountered on Federal land, including but not limited to the land of the Washington Dulles International Airport and the Dulles International Airport Access Highway, shall be treated in a manner consistent with the provisions of the *Native American Graves Protection and Repatriation Act* (25 U.S.C. 3001).

2. Washington Dulles International Airport Historic District

A. At the extant Saarinen "peekaboo" view locations shown in Exhibit D, the vertical profile of the Metrorail tracks and the concrete safety barrier will be constructed as low as practicable given site conditions to minimize any obstruction of these views of the main terminal control tower.

B. The design of the Dulles Airport Metrorail station and terminal connections will consider, and incorporate where appropriate, established airport design themes and finishes within the context of the WMATA design criteria, approved system-wide facility requirements and operational practices in effect at the time of the design. The design of aerial structures and portals located within the historic district boundaries will consider, and incorporate where appropriate, concepts and materials that are mutually agreed to be compatible with the historic terminal and other contributing elements of the historic district. No later than the completion of Preliminary Engineering for the *Extension to Dulles Airport/Route 772* phase of the Project, DRPT shall submit the proposed designs to the SHPO for review and approval and to the other required and concurring signatories for review and comment.

C. No later than the completion of Preliminary Engineering for the *Extension to Dulles Airport/Route 772* phase of the Project, DRPT will submit a treatment plan to the SHPO for review and approval and to the other required and concurring signatories for review and comment. This treatment plan will identify specific treatments that would provide users of the Metrorail station and airport travelers with an appreciation for the airport's unique historic characteristics. Several potential measures will be considered, including, but not limited to: interpretive exhibits or artwork within the station facilities, connecting walkways, or terminal buildings; photo or video documentation of the view sequence; and removal of non-historic vegetation on airport property to enhance the historic views. DRPT will ensure that all measures in the approved treatment plan are completed or installed prior to the beginning of revenue service for this phase of the Project.

D. The SHPO shall, within 30 calendar days of receipt, review any treatment recommendations and designs submitted pursuant to this Agreement and either approve or provide comments. If no response is provided by the SHPO within 30 calendar days of receipt, DRPT may assume SHPO concurrence and approval. DRPT will review any comments and take them into account in the continued development of Project design. Should the SHPO object to any plans submitted pursuant to this Agreement, the provisions of Stipulation 4 will apply.

3. Annual Report

DRPT, in consultation with MWAA, will prepare an annual report summarizing the activities carried out in accordance with this Agreement. This report will be transmitted to all required and concurring signatories by January 15th of each year this Agreement is in effect, beginning in the year following the execution of the Agreement and continuing until the year following completion of construction activities associated with the Project. The DRPT shall also ensure that this annual report is made available for public review and that members of the public are invited to provide comments to the SHPO and other required and concurring signatories to the Agreement.

The required signatories to this Agreement shall review the annual report and provide any comments to the DRPT. Concurring signatories to this Agreement may review and

comment on the annual report at their discretion. Based on this review, the required signatories to this Agreement shall determine whether this Agreement shall continue in force, be amended, or be terminated. If requested by any required or concurring signatory to this Agreement, the FTA shall ensure that a meeting is held to facilitate review and comment, to resolve questions, or to resolve adverse comments.

4. Dispute Resolution

A. If any required or concurring signatory should object in writing regarding any action specified in the Agreement, then FTA shall consult with the objecting party to resolve this objection. If after such consultation, FTA determines that the objection cannot be resolved through consultation, then DRPT shall prepare documentation relevant to the objection in accordance with 36 CFR 800.11, and FTA shall forward such documentation to the Council, including FTA's proposed response to the objection. Within 30 days after receipt of all pertinent documentation, the Council is expected to exercise one of the following options:

- Provide FTA with a staff-level recommendation, which FTA shall take into account in reaching a final decision regarding its response to the objection; or
- Notify FTA that the objection will be referred for formal comment pursuant to 36 C.F.R. Section 800.7(c), and proceed to refer the objection and comment. FTA shall take into account the Council's comments in reaching a final decision regarding its response to the objection.

B. The responsibility of each required signatory to this Agreement to carry out all actions under the Agreement not affected by the dispute shall remain unchanged.

C. If the dispute cannot be resolved upon involvement of the Council, FTA, DRPT, or the SHPO may terminate the Agreement in accordance with Stipulation 6.B below.

5. Amendments

Any required signatory to this Agreement may request that it be amended, whereupon the required and concurring signatories shall consult to consider the proposed amendment in accordance with 36 CFR 800.6(c)(7). Any amendment shall be in writing and signed by all required signatories of this Agreement.

6. Termination

A. This Agreement shall terminate on January 15th of the year following completion of construction activities associated with the Project.

B. Any required signatory to this Agreement may terminate it by providing a 30 day written notice to the other required and concurring signatories, provided that these parties consult during the period prior to termination to seek agreement on amendments or other actions that would avoid termination. In the event of termination, work on the Project in the area(s) with affected historic properties will cease until FTA has fulfilled its Section 106 responsibility in accordance with 36 CFR 800.3 through 800.13.

Execution of this Agreement by the FTA and the SHPO and its submission to the Advisory Council on Historic Preservation in accordance with 36 CFR 800.6(b)(1)(iv), shall, pursuant to 36 CFR 800.6(c), be considered to be an Agreement with the Council for the purposes of Section 110(l) of NHPA. Execution and submission of this Agreement, and implementation of its terms evidences that FTA has afforded the Council an opportunity to comment on the Project and its effects on historic properties and has taken into account the effects of the Project on historic properties.

IN WITNESS WHEREOF, the Parties have caused this Agreement to be signed intending thereby to be bound by its provisions.

Environmental Conditions (Sheet 12) Locally Preferred Alternative

Revision Date: 12-08-04

Dulles Corridor Rapid Transit Project

APPENDIX H- ALTERNATIVES PREVIOUSLY CONSIDERED

APPENDIX H: ALTERNATIVES PREVIOUSLY CONSIDERED

This appendix provides an overview of the process that led to the selection of the Locally Preferred Alternative (LPA) for the Dulles Corridor Rapid Transit Project, and includes a summary of the reasons why particular alternatives were eliminated from further consideration. This provides a record that all reasonable alternatives for the project were examined and presented to the public during the preliminary engineering and environmental review process.

Section H.1 outlines the process used to identify and evaluate the initial list of alternatives for the Dulles Corridor Rapid Transit Project. A more comprehensive description of the evaluation methodology and the screening evaluation conducted in the early stages of the Draft Environmental Impact Statement (EIS) process can be found in the *Evaluation Methodology Report* (November 2000) and the *Final Alternatives Analysis Report* (May 2001).

Section H.2 addresses alternatives considered during the development of the Draft EIS. Detailed information on the continued evolution and evaluation of alternatives prior to publication of the Draft EIS can be found in the *Addendum to the Final Alternatives Analysis Report* (August 2003).

Section H.3 focuses on the evaluation of alternatives considered as a result of public comment on the Draft EIS following its publication. Additional detail is included in the *Addendum to the Final Alternatives Analysis Report*.

Section H.4 includes a summary of the reasons particular alternatives considered in the Draft EIS were not recommended as the LPA. The Project Team recommendations for the LPA are included as Attachment A to the *Public Hearings Report Supplement* (November 2002).

H.1 ALTERNATIVES CONSIDERED DURING INITIAL ALTERNATIVES ANALYSIS PROCESS BUT NOT CARRIED FORWARD

Numerous alternatives were evaluated during the early stages of the Dulles Corridor Rapid Transit Project. These alternatives were subjected to a two-phase screening process that applied increasingly detailed and comprehensive measures of effectiveness to a decreasing number of alternatives. This process allowed decision makers to identify similarities, differences, and trade-offs between each alternative, and carry forward those alternatives that performed better in meeting the transportation needs of the corridor for further evaluation in the Draft EIS. This screening process is described in more detail in the following sections, and the reasons for eliminating specific alternatives are presented.

H.1.1 INITIAL NEPA ALTERNATIVES

As shown in Table H-1.1 and in Figures H.1-1, H.1-2, H.1-3, H.1-4, the initial set of alternatives included various rapid transit modes, alignments, station locations, and ancillary facilities. These alternatives were developed based on recommendations from the MIS and MIS Supplement (see Section 2.1 of the Final EIS) and the scoping process for the Draft EIS.

Table H-1.1: Initial NEPA Alternatives

Modes	BRT Metrorail * Light rail transit (LRT) * Personal rapid transit * Monorail * Feeder system to Metrorail stations in Tysons Corner (LRT, people mover) BRT or express buses in a dedicated lane on the DIAAH
Alignments	BRT Alignment. Alignment recommended in MIS Supplement. Serves Tysons Corner via DIAAH with station at Spring Hill Road. Line O1. Orange Line through Tysons Corner via Dulles Connector Road. Line O2. MIS Alignment with western leg that provides service to West Falls Church Station. Line T1. Tysons Corner via Route 123 and Route 7. Line T2. Tysons Corner aerial loop via Route 123, Route 7, and Westpark Drive. Line T3. Alignment that connects the Dulles Corridor Rapid Transit Project to a possible rail line in the Capital Beltway Corridor. Line T4. Alignment T2 with pocket tracks instead of loop connectors. Line T5. Underground loop alignment. Line T6. Alignment T1 with an additional station. Line T7. Alignment from the Orange Line through Tysons Corner via Route 7. * Line T8. Station in DIAAH near Spring Hill Road that connects to a feeder system to serve Tysons Corner. Line T9. Alignment T1 with a completely aerial structure. Line T10. Alignment T2 with an additional track on the southern leg of the loop. Line T11. Large aerial loop that would include a station adjacent to the Capital Beltway. This alignment could connect to Alignment B1 as well as a possible future transit line in the Beltway Corridor. (This alignment was developed by WMATA subsequent to the scoping process.) Line B1. Orange Line connection via the Capital Beltway. Line D1. Tysons Corner to Washington Dulles International Airport via DIAAH or DIAAH median. * Line D2. Direct service to Reston Town Center via the Washington & Old Dominion Railroad Regional Park. Line A1. Dulles Airport via service roads for BRT and underground alignment for Metrorail. Line L1. Dulles Airport to Route 772 in Loudoun County via Dulles Greenway. Line S1. Combined rail alignments in Dulles, I-66, Route 50, and Route 28 corridors.
Stations	Spring Hill Road (BRT) Tysons East (Metrorail) Tysons Central (Metrorail, T1) Tysons Central Alternative. Shift of Tysons Central Station for T1 to the east. (Metrorail) Tysons Central A, B, C, and D (Metrorail, T2) Tysons West (Metrorail) Tysons East and West with third tracks and second platform (comparable to configuration at National Airport). (Metrorail) BRT/Metrorail Transfer Station (location to be determined) * Wolf Trap Farm Park. Determine whether station is viable. (Metrorail) Addition of Hunter Mill Road Station (Metrorail) Wiehle Avenue (BRT to Metrorail) * Removal of Wiehle Avenue Station (BRT to Metrorail) Reston Parkway (BRT to Metrorail) Relocate Wiehle Avenue and Reston Parkway stations near or under the highway overpasses (BRT to Metrorail) Herndon-Monroe (BRT to Metrorail) Route 28 BRT Station. Addition of a BRT station in DIAAH median (BRT to Metrorail) Route 28 (Metrorail) Accommodate a future LRT station at Route 28 (Metrorail) Dulles Airport (BRT, Metrorail) Route 606 (BRT, Metrorail) Route 772 (BRT, Metrorail)

* Indicates alternatives that were examined during the MIS process, but were eliminated from further evaluation.

For the stations, "BRT to Metrorail" indicates BRT stations that would be convertible to Metrorail, and "BRT, Metrorail" indicates locations that would have BRT stops or Metrorail stations.

During the alternatives analysis process, it was assumed that the BRT Maintenance and Storage Facility and the Metrorail S&I Yard would be collocated on a single site.

Because of the large number of rail alignment alternatives, the corridor was divided into geographic sections to facilitate presentation and discussion. The labels of the alignments conform to the sections of the corridor below, and are presented in general east-to-west order:

- O is for the section of line connecting to the existing Metrorail Orange Line.
- B is for a transit line under study in the Beltway Corridor.
- T is for the section of line in Tysons Corner.
- D is for the section of line in the Dulles Airport Access Road.
- A is for the section of line at Dulles Airport.
- L is for the section of line in Loudoun County.
- S is for a rail line in the Sully Road (Route 28) corridor.

The development of the initial National Environmental Policy Act of 1969 (NEPA) alternatives is described in more detail in the *Scoping Process Report* (September 2000). Some alternatives were added following publication of the *Scoping Process Report*, in response to either ongoing engineering studies or additional public comment.

H.1.2 EVALUATION PROCESS

To determine which alternatives would move forward for detailed evaluation in this Draft EIS, the initial NEPA alternatives were evaluated and screened in a two-phase process: initial screening and intermediate screening. As outlined in the *Evaluation Methodology Report*, the process applied increasingly detailed and comprehensive measures of effectiveness to a decreasing number of alternatives. The alternatives advanced or carried forward for further evaluation at the end of each phase were the ones that were determined to best achieve the following:

- Improved transportation service;
- Increased transit ridership;
- Supported future development;
- Supported environmental quality;
- Provided cost-effective, achievable transportation choices; and
- Served diverse populations.

These project goals are based on those originally developed during the 1997 MIS.

The intent of the initial and intermediate screening evaluations was to compare the relative performance of a large number of alternatives using a small number of criteria. The four basic categories of evaluation criteria identified in the *Evaluation Methodology Report* are social, environmental, economic, and transportation. Analysis of performance relative to these criteria enabled the project team to distinguish between those alternatives that were likely to be most effective in meeting the project's goals and those that were not.

The results of the alternatives screening process are presented in Table H.1-2. Each of the alternatives eliminated from further consideration is discussed in more detail in the following sections.

H.1.3 INITIAL SCREENING

The initial screening criteria, as defined in the *Evaluation Methodology Report,* included consistency with land use plans, order of magnitude capital costs, service to activity centers within the Dulles Corridor and the region, and compatibility with existing infrastructure, among others. At this level of analysis, most measures were qualitative. Because not all of these criteria are sensitive to differences between modes, the initial screening was conducted as a two-part process. First, the modes (i.e., Metrorail, BRT, light rail, personal rapid transit, and monorail) were reviewed using appropriate measures of effectiveness. Then, the alternative alignments, stations, and ancillary facilities were evaluated. The following sections identify the alternatives that were eliminated from further study during initial screening and summarize why these alternatives were not carried forward for additional analysis.

H.1.3.1 Modes

Several modes added to the list of alternatives during the scoping process were previously examined and eliminated from further study during the 1997 MIS. The project team reviewed the reasons for the decisions to eliminate these modes and reaffirmed the validity of these decisions based on current data.

Light Rail Transit

Light rail transit was suggested in lieu of Metrorail because it is a rail technology that can operate on alignments that are not grade-separated. Typically, light rail is a mode that consists of passenger rail cars operating in short trains. The cars are usually powered electrically by overhead catenary lines, although diesel-powered systems do exist. This mode was eliminated during the 1997 MIS.

It was determined that light rail would not be as cost-effective as Metrorail because it would require a transfer at the Metrorail Orange Line, which would reduce ridership in the Dulles Corridor. Also, the capital costs for light rail would be similar to those for Metrorail because it would have to follow the same grade-separated alignment as a Metrorail alternative through Tysons Corner and at Dulles Airport, reducing any potential cost-savings benefits. For these reasons, light rail transit was eliminated from further consideration.

Personal Rapid Transit

Personal rapid transit is a technology typically envisioned to function like an automobile in an urban setting. The technology uses small, low-capacity vehicles (one to four persons) and, ideally, would have numerous closely spaced stations in a dense guideway network.

This mode, eliminated during the 1997 MIS, was also suggested in lieu of Metrorail, but was eliminated from further consideration because it is not a technology intended to provide the long-distance, high-speed service required in the Dulles Corridor.

Table H.1-2: Alternatives Considered During the Screening Process

	Alternatives Eliminated in Initial Screening	Alternatives Eliminated in Intermediate Screening	Alternatives Evaluated in Draft EIS
MODES	Personal Rapid Transit Light Rail Transit (LRT) Monorail Feeder System to Metrorail stations in Tysons Corner BRT or Express Buses in a Dedicated Lane on the DIAAH	None	BRT Metrorail
ALIGNMENTS	Route 7 (T7) Tysons DIAAH Station with Feeder System (T8) Partial Double-Track Loop (T10) Large Aerial Loop (T11) Beltway Access thru Tysons (B1) Direct Service to Reston Town Center (D2) Dulles, I-66, Route 50, and Route 28 Connection (S1)	Service to West Falls Church (O2) Tysons Loops (T2, T5) Interface with Beltway Rail Line (T3)[a]	MIS Supplement BRT Alignment[b] MIS Rail Alignment (O1, T1, D1, A1, L1) Tysons MIS Alignment Variations (T6, T9)[d] Tysons Loop (T4)
STATIONS	Stations that were only associated with Alignments T7, T8, T11, and D2 Addition of Hunter Mill Road Station Removal of Wiehle Avenue Station	Platform connection to West Falls Church for O2 The MIS Tysons Central Station for T1 Wolf Trap Farm Park Station as a special use station[c] Relocation of the Wiehle Avenue and Reston Parkway stations under or near the highway overpasses Accommodation for Route 28 LRT[a]	Stations and stops associated with the MIS Supplement BRT Alignment Stations associated with the MIS Metrorail Alignment and its variations (O1, T1, D1, A1, L1 and T6, T9) [d] Stations associated with the Tysons loop alignment (T4) Route 28 BRT Station Tysons Central Alternative Station Tysons East and West stations with third track
ANCILLARY FACILITIES	Nine potential yard sites in Loudoun County	Two sites for BRT maintenance facility and rail yard near Route 606 interchange (Y6, Y10) Rail yard site at south end of Dulles Airport property (Y13) Two potential yard sites in Loudoun County and three sites on Dulles Airport as part of a supplemental study.	One rail yard site near Route 606 interchange (Y7)[e] One BRT maintenance facility site at north end of Dulles Airport property (Y14)[e] Two additional sites south of the Dulles Greenway along Route 606 (Y15, Y20)[f] West Falls Church Yard Complex

a In the future, the project team will cooperate with the groups implementing these projects and coordinate design with them to the extent feasible.

b The BRT alignment was refined after Intermediate Screening. Two options were added with varying station and stop locations.

c Only provisions to accommodate a future station at Wolf Trap Farm Park were evaluated in the Draft EIS.

d Alignment T9 was refined after Intermediate Screening. It remained a largely aerial alignment, with a short underground section. A technical memorandum was prepared discussing the rationale for revising Alignment T9.

e Site 14 was introduced after Intermediate Screening. It was carried forward in lieu of Site 7 for the BRT maintenance facility.

f Sites 15 and 20 were introduced after Intermediate Screening as part of the Supplemental Rail Yard Study (described in more detail in Section 2.6.5). Site 15 would include a rail yard only. Site 20 could support both a BRT maintenance facility and a rail yard.

Monorail

Monorail consists of automated transit vehicles operating on or suspended from a single rail, beam, or tube. Even though it was eliminated during the 1997 MIS, monorail was considered in lieu of Metrorail in the Dulles Corridor. As was the case with light rail, monorail would not be as cost-effective as a Metrorail alternative due to comparable or higher capital costs and lower ridership resulting from the forced transfer at the Orange Line. Therefore, monorail was eliminated from further consideration.

Feeder Systems

Different feeder system alternatives considered for the project included light rail transit and an elevated people-mover within Tysons Corner as a feeder to Dulles Corridor stations. People-movers are typically automated rail systems that use passenger vehicles operating individually or in multi-car trains. The guideway for this mode must be grade-separated.

These options for a fixed-guideway feeder system were eliminated from further consideration because they would not be cost-effective. Analysis conducted for the MIS demonstrated that a fixed-guideway feeder system would not enhance ridership on a Dulles Corridor line that followed either a Route 123-Route 7 alignment or a loop configuration in Tysons Corner. Moreover, the analysis showed that such a feeder system would substantially add to the cost of the project. Given that the feeder system would not substantially increase ridership on the Dulles Corridor line as a whole, it would be considered an unreasonable expenditure in the context of the Dulles Corridor Rapid Transit Project.

BRT or Express Bus (in lieu of BRT) Operating in Dedicated Third Lane on the DIAAH

These options were eliminated from further consideration because current and future traffic projections for the existing configuration of the DIAAH do not warrant construction of a dedicated lane as part of the Dulles Corridor Rapid Transit Project. Because the DIAAH only provides service to and from the airport and does not serve general traffic, it is expected that traffic flow on this road during peak periods will be, at worst, moderately congested. This flow of traffic would not interfere with the speed or reliability of bus operations in the DIAAH. When traffic flow on the DIAAH degrades, the Metropolitan Washington Airports Authority (MWAA) plans to build this additional lane for all airport traffic.

Current express bus operations in the corridor and planned operational enhancements are part of the phased implementation program recommended in the MIS Supplement. These operations were analyzed as an alternative to BRT as part of the No Build Alternative.

H.1.3.2 Alignments

With the exception of the BRT alignment, most of the alignment alternatives under consideration were variations of the rail alignment recommended in the MIS. Each of the alignments eliminated during initial screening and discussed below were proposed rail alignments.

Route 7 Connection (T7)

Alignment T7 was a connection from the Orange Line through Tysons Corner via Route 7. This alignment was eliminated from further consideration because it would not serve the eastern part of the Tysons Corner area as effectively as other proposed alternatives.

DIAAH Alternative with a Feeder System (T8)

Alignment T8 consisted of a rail station in the DIAAH near Spring Hill Road that connected to a feeder system to serve Tysons Corner. This alignment was examined during the MIS and was eliminated from further consideration because ridership would be lower due to the forced transfer between Metrorail and the feeder system. In addition, it was determined that this alternative might have impacts on residences and historic resources near the Spring Hill Road Station. The MIS assumptions were examined and verified during initial screening.

Partial Double-Track Loop (T10)

This alignment consisted of an aerial loop in Tysons Corner following Route 123, Route 7, and Westpark Drive with a double-track configuration on the southern leg of the loop. It was determined that T10 could provide operational flexibility in Tysons Corner; however, this flexibility could be provided through less costly options. The alternative was eliminated from further consideration because its additional costs and impacts would yield little or no additional benefit, particularly given that T10 was not likely to provide better service than the single-track loop configuration under consideration.

Beltway Connection (B1 and T11)

Alignment B1 provided an Orange Line connection via the Capital Beltway, while Alignment T11 consisted of a large aerial loop that would include a station adjacent to the Capital Beltway. Alignment T11 could connect to Alignment B1, as well as a possible future transit line in the Beltway Corridor.

Alignments B1 and T11 were eliminated from further consideration because they would have higher costs but not greater benefits than other proposed alternatives. Because of the planned widening of the Beltway, I-66, Route 7, and Route 123, implementation of Alignment B1 would require significant right-of-way acquisition at substantial cost. In addition, the larger loop of Alignment T11 would provide inferior service coverage compared to other loop alternatives and would be more costly than the smaller loop.

Alignment D2

Alignment D2 would provide direct service to Reston Town Center via the Washington & Old Dominion (W&OD) Railroad Regional Park, in lieu of the indirect service provided by an alignment in the DIAAH median. Alignment D2 is not consistent with existing land use, nor is it consistent with local or regional land use plans. Development of Alignment D2 would not preclude other planned improvements from occurring, but it would preclude the continued use of the W&OD Railroad Regional Park in certain areas because parkland would be converted for permanent use as a rail line. Because the DIAAH median alignment provides a prudent and feasible alternative to the use of this parkland, and would not have impacts on the park, Alignment D2 was eliminated from further consideration, consistent with Section 4(f) of the U.S. Department of Transportation Act of 1966.

Alignment S1

Several alignments suggested during the scoping process involved connections to transit improvements in the corridor that are either currently under study or are identified in long-range plans. Alignment S1 combined the proposed Dulles Corridor alignment with two other rail alignments: one an Orange Line extension in the I-66 Corridor that is currently under study as a separate project, and the other a proposed rail line along the Route 28 and Route 50 corridors. This large loop alignment was eliminated from further consideration because it was inconsistent with federal guidelines for defining the scope of a project for evaluation in an EIS. The guidelines state that a proposed project should have logical endpoints and should be usable as an independent improvement, even if additional transportation

improvements in the area are not made. The various segments of Alignment S1 would each have logical endpoints and would function as independent improvements if the other segments were not developed. Therefore, each should be studied as a separate project.

H.1.3.3 Stations

Stations that were located only on alignments that were eliminated from further consideration were also eliminated. For example, Alignment D2 was eliminated from further consideration, precluding stations proposed along the former W&OD right-of-way at Wiehle Avenue and Reston Town Center. Summarized below is the initial screening analysis for eliminated station alternatives that were not alignment-specific.

Hunter Mill Road Station

The proposed Hunter Mill Road Station was eliminated from further consideration because the station is not consistent with current or planned land use in the vicinity. Low-density land uses surrounding the proposed site would not generate enough ridership to support a station at this location. In addition, the citizens in the area have expressed strong opposition to a station at Hunter Mill Road.

The Dulles Corridor Land Use Task Force, appointed by the Fairfax County Board of Supervisors, stated strong opposition to a station at Hunter Mill Road in lieu of the proposed station at Wiehle Avenue. The Task Force voted at its session on February 26, 2001 to endorse the elimination of the Hunter Mill station and continued planning for the Wiehle Avenue station. The Comprehensive Plan changes adopted by the Fairfax County Board of Supervisors on May 21, 2001 support this position; no transit-oriented land use plans have been adopted or considered for a proposed station in the vicinity of Hunter Mill Road.

Though it was suggested during scoping that the proposed Wiehle Avenue Station be eliminated from the project, this station was retained for further analysis based on the current and planned uses for the area surrounding the proposed station location. These uses generate demand that cannot be adequately served by the Reston Parkway Station. As described above, the Dulles Corridor Land Use Task Force endorsed the continued consideration of the Wiehle Avenue Station.

H.1.3.4 Ancillary Facilities

During initial screening, 13 potential sites were examined for the BRT Maintenance and Storage Facility and the Metrorail Service and Inspection (S&I) Yard as shown in Figure H.1-4. Four sites were recommended during the MIS and additional sites were identified during agency coordination for the Draft EIS.

Nine of the proposed sites were eliminated during initial screening because they were inconsistent with local land use plans and zoning designations or because they contained or were crossed by important water resources in Loudoun County. For instance, sites located in areas consisting of, or zoned for, residential development or mixed-use and office park development were eliminated because these uses were not considered consistent with a transit system maintenance and storage facility. In addition, sites that traversed or were located near Broad Run and Horsepen Run (two streams in Loudoun County) were eliminated from further consideration.

Other ancillary facilities, such as traction power substations and tie-breaker stations, were not evaluated during initial screening because siting of these facilities was not complete at that time.

H.1.4 INTERMEDIATE SCREENING

The alternatives carried forward from initial screening were subjected to a more robust evaluation in intermediate screening. In this phase of evaluation, many of the criteria applied during initial screening were measured more quantitatively. For instance, the initial screening only considered the number of trip generators or the amount of employment within walking distance of a station to determine an alternative's ridership potential, whereas the intermediate screening used output from the travel demand model to generate preliminary ridership estimates for the remaining alternatives. Project staff also developed preliminary capital costs for the alternatives based on standard costs for various project elements.

Alternatives that were eliminated during intermediate screening and the reasons they were not carried forward for full evaluation in the Draft EIS are discussed in the following sections.

H.1.4.1 Alignments

Alignments eliminated during intermediate screening were proposed Metrorail alignment alternatives.

Orange Line Connection (O2)

Evaluation of the Orange Line Connection focused on the relative costs and benefits of a western leg that would allow trains from the Dulles Corridor to continue directly to the western end of the Orange Line. The configuration with the western leg, called Alignment O2, was a design variation of Alignment O1, the MIS configuration for connecting to the Orange Line. Alignment O1 is the basic configuration required to allow trains from the Dulles Corridor line to connect to the rest of the Metrorail system, but would require a transfer for passengers traveling west on the Orange Line.

The intermediate screening evaluation showed that Alignment O2 would cost nearly twice as much as Alignment O1, but the expected increase in ridership for Alignment O2 was negligible. In addition, Alignment O2 was expected to have greater impacts on adjacent communities. Because the higher costs and impacts associated with Alignment O2 would not be warranted by the small expected increase in ridership, it was eliminated from further consideration.

Should the Orange Line be extended to Centreville in the future, travelers from the western portions of the region would be able to access the Orange Line closer to their homes and avoid traffic congestion en route to Vienna. Riders from these areas may create demand for a direct connection between the Dulles Corridor and the western end of the Orange Line. Accordingly, the design of Alignment O1 does not preclude future development of a western connection to the Orange Line.

Loop Alignment and Variations (T2 and T5)

Three variations of the loop alignment for serving Tysons Corner were carried forward from initial screening. These alignments were evaluated relative to one another during intermediate screening, and it was determined that two of the loops would have significantly higher costs and impacts.

Due to the inclusion of loop connectors, Alignment T2 would have greater potential for visual and noise impacts on adjacent residential communities than Alignment T4 (a similar alignment without the loop connectors). Alignment T2 would also have operational difficulties, and higher capital, operating, and maintenance costs than Alignment T4, but would only provide modest ridership benefits. Alignment T5 would avoid many of the impacts of Alignments T2 and T4, but would have much higher costs than these alignments, as well as additional risks associated with underground construction. While Alignment T4

would not be without impacts, it would not have the severity of impacts or the costs associated with Alignment T2, nor would it have the capital cost and level of risk associated with Alignment T5.

Based on these findings, Alignments T2 and T5 were eliminated from further consideration.

Connections to Future Transit Improvements (T3)

During initial screening, study of Alignment T3 was suspended until additional information was available regarding possible modes and alignments for a future rail line in the Capital Beltway Corridor.

The *Capital Beltway Corridor Rail Feasibility Study*, released in March 2001, included recommendations for three different modes, each with a different alignment and station locations. The current Beltway rail plans are not yet developed to a level that would make it appropriate or feasible to conduct detailed coordination efforts related to those improvements. Therefore, Alignment T3 was eliminated from further consideration, as they would not be developed in a time frame consistent with the schedule for the Dulles Corridor Rapid Transit Project.

As work progresses on a future Capital Beltway rail line, the Dulles Corridor Rapid Transit Project team will coordinate with the groups implementing that project and coordinate with them to the extent feasible regarding a connection between the two transit systems.

H.1.4.2 Stations

Tysons Central Station

During initial screening, the possibility of shifting the Tysons Central Station farther to the east for Alignment T1 was carried forward for additional analysis. In intermediate screening, it was determined that the more easterly station location (Tysons Central Alternative Station) would be less costly and would likely have more benefits than the original Tysons Central Station location. Tysons Central Alternative Station would have better connections to existing employment concentrations and to proposed office developments. It also has higher potential for joint development at sites that are currently undeveloped or underdeveloped. Therefore, the original Tysons Central Station was eliminated from further consideration in favor of the alternative location.

Wolf Trap Farm Park Station

Based on coordination with the National Park Service (NPS) and the Wolf Trap Foundation (a non-profit organization associated with the park), it was determined that a station at Wolf Trap would not be constructed as part of the Dulles Corridor Rapid Transit Project. The project would include provisions to accommodate a future Wolf Trap station, but the station itself and its access facilities were eliminated from further consideration. Only the provisions required to accommodate the future station were fully evaluated in the Draft EIS. Should funding for a station be identified in the future, a separate environmental review process would be required to fully evaluate the proposed station.

Relocation of the Wiehle Avenue and Reston Parkway Stations Under or Near the Highway Overpasses

The project team proposed that the Wiehle Avenue and Reston Parkway stations be located in the median of the DIAAH west of their corresponding highway overpasses at places where the DTR has been realigned to accommodate transit stations in the DIAAH median. During the public scoping process, it was suggested that the stations be relocated under the highway overpasses to provide better access to all four quadrants of the interchanges at Wiehle Avenue and Reston Parkway. The feasibility of this

relocation was examined during initial screening. It was determined that moving the stations would be costly and have substantial impacts, but additional analysis was recommended because the benefits of the relocation were not known at that time.

Following the initial analysis, stakeholders suggested that the project team should examine the feasibility of moving the stations closer to the overpasses, rather than directly under them. The stakeholders also encouraged the provision of station access from all four interchange quadrants. This option and the options originally assessed during initial screening were examined during intermediate screening.

In this second analysis, it was determined that moving the stations from the locations where the Toll Road was realigned would increase costs and impacts but would offer no significant benefits. For the central portion of the corridor, Fairfax County has amended their Comprehensive Plan to allow increased densities within the vicinity of transit stations. Because any proposed land use density bonuses would move with the stations (as discussed in the May 2001 recommendations of the Dulles Corridor Land Use Task Force), relocating the stations nearer to or under the overpasses and providing access to all four quadrants of the interchange would not increase ridership potential above that for the stations at the locations where the Toll Road was realigned.

Placing the stations under the overpasses would also generate several safety concerns, including narrow shoulder widths and station security issues. These issues would necessitate rebuilding the DIAAH, the Toll Road, the highway overpasses, and the interchange ramps to accommodate the stations under the overpasses. The result would be substantial cost increases, a lengthier construction period, traffic delays, and extensive impacts on people living and working in the corridor, particularly in Reston.

Similarly, moving the stations closer to the overpasses, as proposed by stakeholders, would necessitate rebuilding the highway overpasses because the proposed design would undermine the pier footings supporting the bridges. It is also possible that shoulder width considerations for this configuration could require rebuilding the DIAAH, the Toll Road, and the interchange ramps.

Given these findings, such relocations of the Wiehle Avenue and Reston Parkway stations were eliminated from further consideration.

Accommodation of Route 28 Light Rail Transit

Accommodation of Route 28 light rail transit (LRT) was evaluated with currently available information about potential transit improvements in the Route 28 Corridor. Several studies have recommended future development of light rail transit in the Route 28 Corridor, including recent proposals by the area's transportation management agency (TMA) that would bring the alignment very near the proposed Route 28 Station for the Dulles Corridor Rapid Transit Project. However, a Route 28 LRT system is not currently included in the Virginia Transportation Development Plan, indicating that, while transit improvements have been identified as desirable in the Route 28 Corridor, no Route 28 transit study is currently being conducted nor is one currently planned by the Commonwealth.

Because plans for a Route 28 LRT system have not been developed to a level that would make it appropriate or feasible to conduct detailed coordination efforts related to those improvements, accommodation of a Route 28 LRT system has been eliminated from further consideration.

H.1.4.3 Ancillary Facilities

Four proposed sites for a BRT Maintenance and Storage Facility and a Metrorail S&I Yard were carried forward for further evaluation in intermediate screening. They include three sites near the Route 606 interchange with the Dulles Greenway (Sites 6, 7, and 10) and one site at the south end of Dulles Airport property near the National Air and Space Museum Udvar-Hazy Center (Site 13). During intermediate screening, the project team determined that each site would have the potential for the following impacts:

- Steep slopes, floodplains, and wetlands restrict the suitability of Site 6.
- Locating a maintenance and storage facility on Site 10 would require extensive property acquisition, including a historic property, from the federal government and from private properties housing existing business operations.
- Site 13 is inconsistent with the approved Airport Layout Plan for Dulles Airport and, like Site 6, may have environmental resources that could be affected by a S&I Yard. Furthermore, locating a S&I Yard on Site 13 would result in significantly higher capital and operating costs due to the required length of the yard lead.
- Although Site 7 also contains floodplains and wetlands that could be affected by a maintenance and storage facility, the relatively large size of the site allows a configuration that would minimize these impacts. In addition, Site 7 has a more optimal end-of-the-line location than Site 13 and it is closer to the mainline tracks.

Based on these findings, Sites 6, 10, and 13 were eliminated from further consideration.

Initially, Site 7 was carried forward as the site for both the BRT Maintenance and Storage Facility and the Metrorail S&I Yard. Following the publication of the *Final Alternatives Analysis Report*, MWAA made a parcel of land on the northern part of the Dulles Airport property available for use as the BRT Maintenance and Storage Facility. This new site, Site 14, was screened using the same criteria applied to potential yard sites during initial and intermediate screening. It was determined that though the site has some floodplain and wetland restrictions, it is consistent with local zoning designations and the Airport Layout Plan. Moving the BRT Maintenance and Storage Facility from Site 7 to Site 14 would also allow the S&I Yard at Site 7 to be reconfigured to further minimize environmental impacts at that site. Therefore, Site 7 was eliminated from further consideration as the site for the BRT Maintenance and Storage Facility.

H.2 ALTERNATIVES CONSIDERED DURING CONTINUED DEVELOPMENT OF DRAFT EIS

Following the publication of the *Final Alternatives Analysis Report*, the ongoing development and review of alternatives for the Draft EIS resulted in several design refinements of existing alternatives, as well as the identification of new alternatives. In order to provide an equivalent evaluation, these alternatives were assessed using the same criteria applied during initial and intermediate screening. The results of these analyses are documented in post-screening technical memoranda.

Many of the refinements identified during this period were carried forward for further evaluation, some in lieu of alternatives that were previously carried forward. Those alternatives that were eliminated from further consideration, and the reasons for their elimination, are discussed below.

H.2.1 ALIGNMENT T9

The T9 alignment carried forward from intermediate screening was an entirely elevated version of Alignment T1 with an optional station at the Tysons Central C location. The Tysons Central Station was configured as a side-platform station with narrow track centers, while the other three stations had center platforms with wide track centers.

As part of conceptual design development in support of the Draft EIS, the design of Alignment T9 was refined. For T9 Revised, all stations had side platforms and narrow track centers and the profile of the alignment was lowered along Route 123. In addition, a short tunnel segment was added in the vicinity of the Route 123/Route 7 interchange.

A screening evaluation of the revised alignment showed that, relative to the T9 alignment carried forward from the alternatives analysis phase, Alignment T9 (Revised) would likely offer cost savings, enhanced structural efficiencies, and several other benefits such as the reduction of visual impacts on surrounding communities. However, the revised alignment would also have a number of drawbacks including increased right-of-way requirements, and the increased potential for noise impacts in certain residential areas adjacent to the alignment. It was decided that Alignment T9 (Revised) should be carried forward in lieu of the original Alignment T9, because the trade-offs associated with the revised alignment could not be fully evaluated during screening due to the lack of detailed cost and environmental data. The original Alignment T9 was eliminated from further consideration so that a wider range of configurations could be examined in detail in the Draft EIS.

H.2.2 STATION CONVERTIBILITY CONCEPTS

The three Build Alternatives initially carried forward for evaluation in the Draft EIS were envisioned as three construction stages in a phased implementation program. The BRT Alternative would be constructed first; then Metrorail would be constructed from the Orange Line through Tysons Corner, connecting to BRT service between Tysons Corner and Loudoun County; and finally, Metrorail would be constructed between Tysons Corner and Loudoun County, replacing BRT service in the corridor. Although the three Build Alternatives were to be evaluated as stand-alone alternatives, it was initially proposed that the overall project move forward with the phased approach.

As work on the Draft EIS progressed, it was decided to evaluate the phased implementation program as a fourth Build Alternative, called the Phased Implementation Alternative. A key element of this alternative was the DAAH median stations, which were to be constructed during the BRT phase for BRT use, then later converted to rail stations for Metrorail use.

Seven concepts for converting the median BRT stations to Metrorail stations were explored. The range of concepts included center- and side-platform configurations and shared and exclusive guideway configurations. Several concepts involved constructing the full Metrorail platform prior to the beginning of BRT operations, with 260 feet of the platform temporarily configured as a low platform for BRT operations.

These potential station configuration concepts were assessed against three main evaluation criteria:

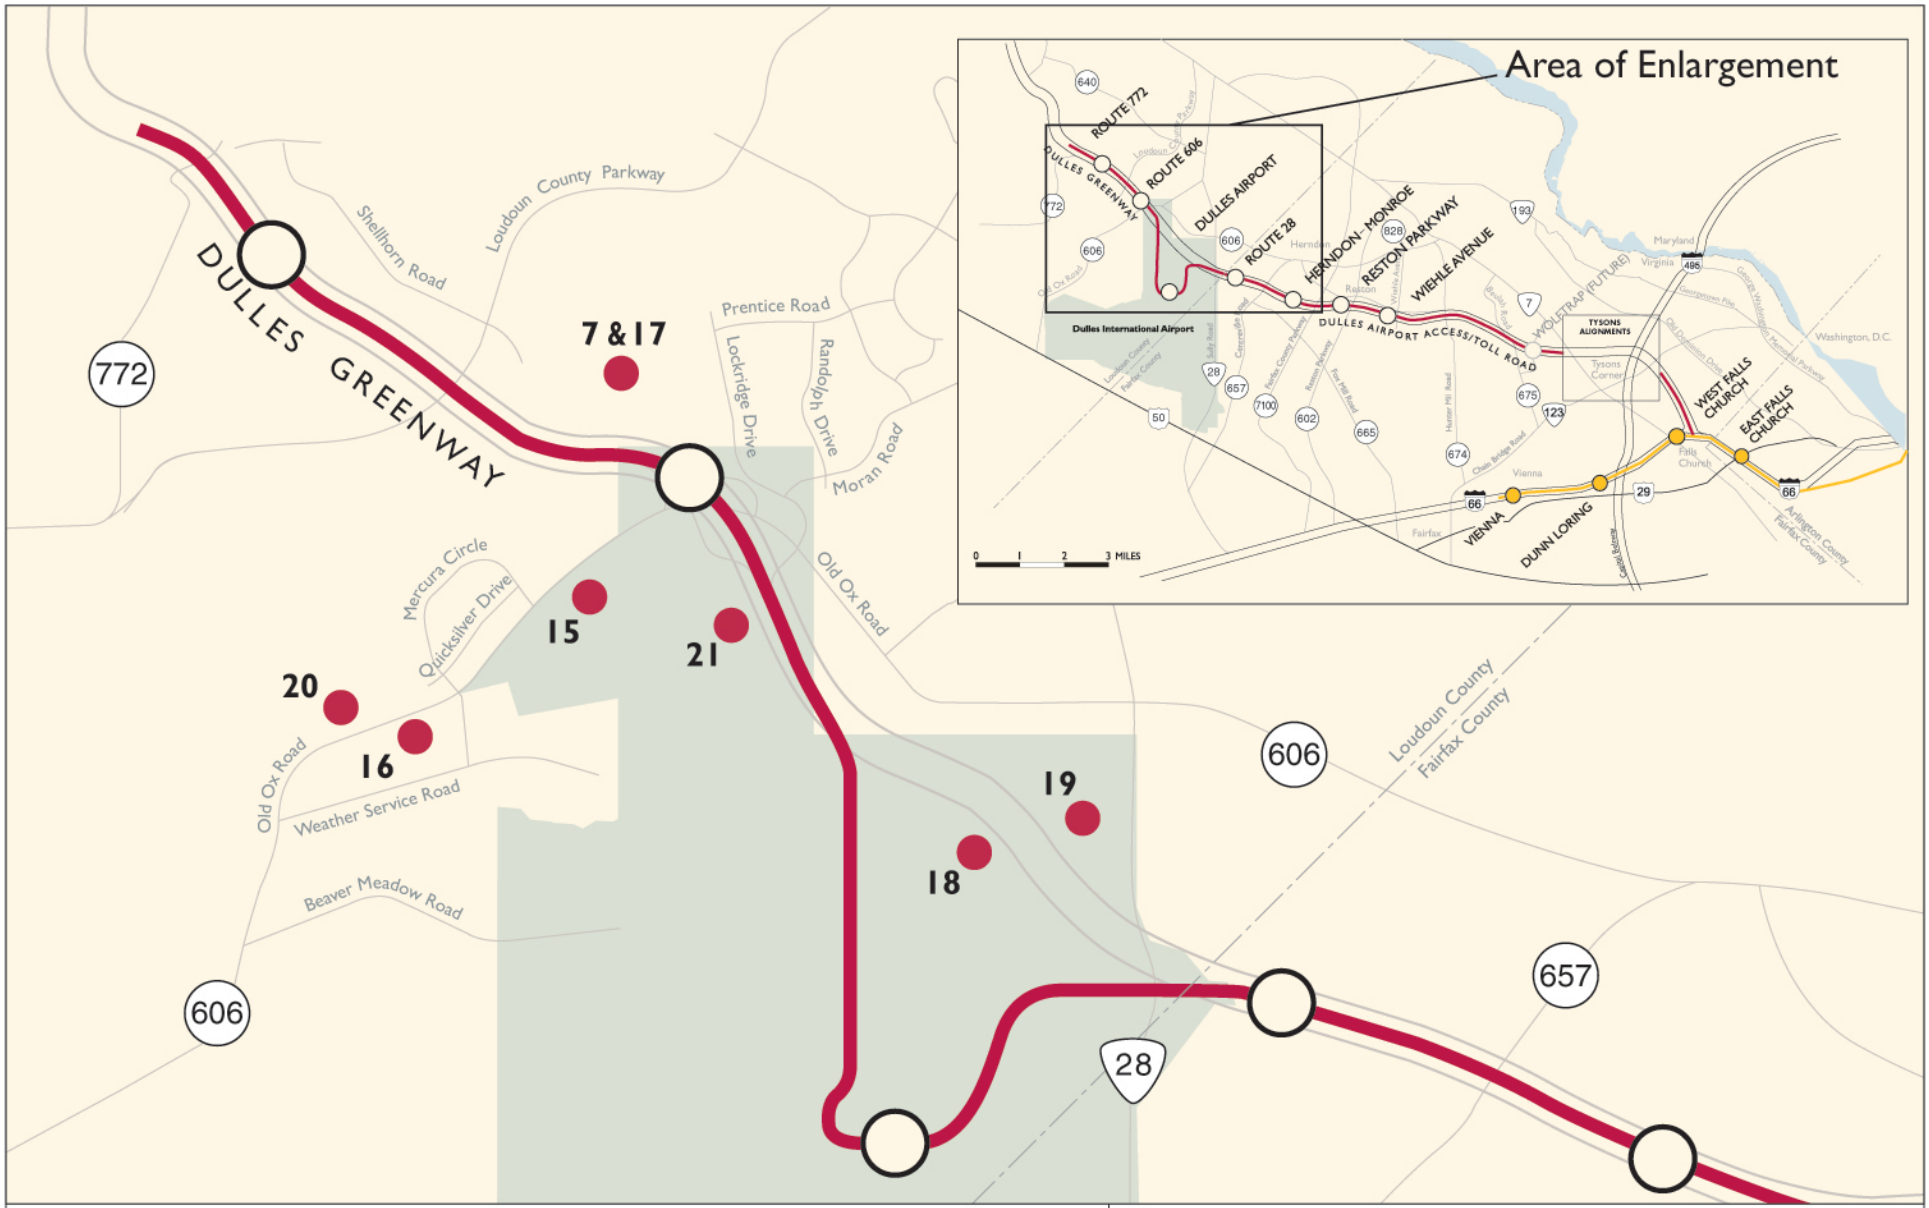
1) Minimize downtime during conversion, that is, the time during which joint-use guideway areas and other station elements would be unavailable for BRT use during Metrorail start up and testing.

2) Limit BRT station width to a maximum of 80 feet so as to avoid additional widening of the DIAAH or the DTR.
3) To the extent feasible, preserve MWAA's ability to construct and operate future third lanes of the DIAAH independently of the Dulles Corridor Rapid Transit Project. In order to meet this criterion, overall station widths of 60 feet or less are necessary.

Based on the evaluation, three conversion concepts were eliminated from further consideration because they violated one or both station width criteria. Two other concepts were eliminated because they would require reduced BRT running speeds, would have the potential for damage to the third rail during BRT operations, and would limit rail testing and startup to non-revenue hours.

H.2.3 SUPPLEMENTAL RAIL YARD STUDY

In November 2001, the Steering Committee for the Dulles Corridor Rapid Transit Project asked the DRPT and WMATA to consider alternative yard sites to Site 7. In response, the project team initiated a Supplemental Rail Yard Study to examine different end-of-line locations for a Metrorail S&I Yard. Sites were also assessed to determine the feasibility of collocating the BRT Maintenance and Storage Facility with the S&I Yard.



As shown in Figure H.2-1, seven supplemental yard sites were investigated during the study, all of which were located in Loudoun County. Four of the sites were located on Dulles Airport property. All sites were evaluated using the same screening process applied to the Initial NEPA Alternatives. For initial screening, the supplemental sites were assessed at a lower level of detail against the same social, environmental, economic, and transportation criteria used during the previous alternatives analysis. Five sites were eliminated based on environmental constraints, inconsistencies with land use plans, or operational constraints.

- Use of two of the sites would result in impacts on the Horsepen Run wetlands system—an important water resource in Loudoun County.
- For two other sites, the existing and planned land uses would be inconsistent with a BRT Maintenance and Storage Facility and/or an S&I Yard.
- A fifth site would be inconsistent with WMATA design and operational requirements.

Because only two sites remained following the initial screening, consensus was reached that intermediate screening was not necessary. Both remaining sites, Site 15 and Site 20, were carried forward for detailed evaluation in the Draft EIS.

H.3 ALTERNATIVES CONSIDERED IN RESPONSE TO PUBLIC COMMENTS

On June 28, 2002, the Draft EIS and the General Plans for the Dulles Corridor Rapid Transit Project were made available for public review and comment. The Draft EIS was also circulated to federal, state, and local agencies to solicit comments. Public hearings on the Draft EIS and General Plans were held on July 29, 30, and 31. The Project Team accepted written comments for a period of 62 days from June 28, 2002 to August 28, 2002.

Supplemental Rail Yard Study Sites

Dulles Corridor Rapid Transit Project

During this public review and comment period, several new or modified alternatives were proposed for the project. Those alternatives that were eliminated from further consideration and the reasons they were not carried forward are discussed in the following sections.

H.3.1 DULLES PLAN B

Dulles Plan B was a proposal put forth by several citizens in the project area. In essence, the Dulles Plan B proposal represented a modified version of alternatives already studied in detail in the Draft EIS. The Dulles Plan B proposal contended that a combination of BRT and increased use of the high-occupancy lanes along the DTR could meet the projected demand for transit in the corridor at a much lower cost than Metrorail. The proposal also suggested the implementation of several forms of "private transit," including just-in-time ridesharing (i.e., casual carpooling, slug lanes) and high-occupancy toll lanes.

The Project Team reviewed the range of alternatives proposed on the Dulles Plan B website, but did not recommend the alternative for further study. Although the team's analysis confirmed that increased use of the HOV lanes could have benefits for the Dulles Corridor, such an increase would not dramatically increase the person-moving capacity of the corridor.

Moreover, although the proposed combination of BRT with increased vehicle capacity and increased use of the HOV lanes would provide enough capacity to support the projected demand for Metrorail, it would only do so if all new HOV users are travelers that formerly drove alone. It is very unlikely that incentives to increase HOV use would appeal only to people who previously used the general traffic lanes. It is much more likely that some of the new HOV users would be persons that would have otherwise used the transit system, reducing rather than enhancing demand for transit in the corridor.

Furthermore, capacity is not what truly limits the ability of the BRT Alternative in the Dulles Corridor to serve the same level of demand as Metrorail. BRT would not have the same "drawing power" as Metrorail due to a forced transfer at the Metrorail Orange Line and the lack of a direct connection to Tysons Corner.

The other proposed "private" transit modes were determined to be either infeasible in the Dulles Corridor, or not as beneficial as suggested in Dulles Plan B.

H.3.2 ALIGNMENT T12

Alignment T12 was a split-service alignment, with one branch extending along the DIAAH on the north side of Tysons Corner, and a second branch penetrating the core of Tysons Corner. The north branch of Alignment T12 (or the "express" leg) would be constructed first; allowing service to the remainder of the corridor to begin while construction of the south branch (or "local" leg) is completed. The local leg of the alignment would follow one of the four Metrorail Alignments evaluated in the Draft EIS.

Alignment T12 was eliminated from further consideration because it would have greater costs and impacts than the alternatives considered in the Draft EIS, would not effectively serve corridor activity centers, and would likely result in ridership reductions. In addition, the service associated with the alignment would be difficult to integrate with operations along the rest of the Metrorail system and with the Virginia Department of Transportation (VDOT) expansion plans at the Capital Beltway/DTR/Connector Road interchange.

H.3.3 ALIGNMENT T13

Alignment T13 was an entirely underground variation of Alignment T6, one of four Metrorail alignments evaluated in the Draft EIS. This alignment was eliminated from further consideration because it would have much greater costs than alternatives previously considered in the Draft EIS, with no additional transportation service benefits. Moreover, the primary benefits of the configuration—mitigation of the visual and noise effects associated with the alignments considered in the Draft EIS—could be achieved through much lower cost mechanisms.

H.3.4 ALIGNMENT T14

Alignment T14 was a variation of Alignment T4, one of the four Metrorail alignments evaluated in the Draft EIS. Unlike Alignment T4, which was an entirely aerial loop through Tysons Corner, Alignment T14 included two short underground segments, one along each leg of the loop.

Alignment T14 would reduce the visual impacts of Alignment T4, but would have greater costs, increased risks, no additional ridership benefits, and the same operational complexities. However, given that Alignment T14 presented one of the few viable approaches for mitigating some of the visual effects associated with Alignment T4, it was recommended for further analysis should Alignment T4 be carried forward as the LPA. When the WMATA Board of Directors and the Commonwealth Transportation Board selected Alignment T6 as the LPA, Alignment T14 was eliminated from further consideration.

H.4 BUILD ALTERNATIVES CONSIDERED IN THE DRAFT EIS BUT NOT CARRIED FORWARD

DRPT, in partnership with WMATA and FTA, prepared the Draft EIS to document the evaluation of alternative transit improvements for the Dulles Corridor. The relative merits and potential impacts of several alternatives were evaluated for the Draft EIS. The Build Alternatives included BRT, Metrorail, BRT/Metrorail, and Phased Implementation alternatives. Three BRT alignment options were evaluated, and in Tysons Corner four Metrorail alignments were considered. For the Metrorail and Phased Implementation alternatives, three potential sites for a new S&I yard were evaluated.

Following the public review and comment period, the WMATA Board, the Commonwealth Transportation Board, and local boards of supervisors selected the LPA for the Dulles Corridor Rapid Transit Project from those evaluated in the Draft EIS. Those alternatives that were eliminated from further consideration and the reasons they were not carried forward are summarized in the following sections.

H.4.1 BASELINE AND BUILD ALTERNATIVES

H.4.1.1 BRT Alternative

The BRT Alternative would have several advantages relative to the Metrorail Alternative, including improvements in corridor transit service at an earlier date, fewer impacts on the natural environment, fewer noise and visual impacts, lower traffic impacts in the vicinity of stations (though still higher than the Baseline), lower costs, and higher cost effectiveness. However, BRT would not provide the same degree of improvements in transportation service or increases in overall transit ridership as the Metrorail Alternative. In addition, the BRT Alternative would be less likely to support a focused development pattern, because the comprehensive plans for Fairfax and Loudoun counties include lower density

bonuses for BRT stations along the DTR and Dulles Greenway than for Metrorail stations and no BRT facilities are located in the core of Tysons Corner.

A direct service connector to the core of Tysons Corner was considered for the *Supplement to the Dulles Corridor Transportation Study* (1999). It was determined that direct service would require a grade-separated guideway through Tysons Corner, increasing the cost, time to implement, and impacts of BRT. And because the BRT Alternative would still require a transfer at the Metrorail Orange Line, accessibility to regional activity centers and overall ridership for the alternative would be reduced.

Overall, because the BRT Alternative would not satisfy the long-term travel demand of the corridor, nor provide the same level of support for the desired pattern of development in the corridor, it was not selected as the LPA.

H.4.1.2 BRT/Metrorail Alternative

The BRT/Metrorail Alternative would have some of the advantages and disadvantages of both the BRT and Metrorail alternatives. In general, the BRT/Metrorail would provide better connectivity to Tysons Corner than the BRT Alternative, but would not provide as direct a connection as Metrorail because it would require a transfer to travel between Tysons Corner and the western portions of the corridor. Although BRT/Metrorail would provide improved support for focused development in Tysons Corner, it would not provide the same level of support in the central and western portions of the corridor. In addition, BRT/Metrorail generally would have longer travel times and lower ridership than Metrorail. Because the BRT/Metrorail Alternative would not perform as well as the Metrorail Alternative in terms of transportation and land use benefits, it was eliminated from further consideration.

H.4.1.3 Phased Implementation Alternative

The Phased Implementation Alternative would have all of the benefits and impacts of BRT and Metrorail combined, at a higher cost. Phased Implementation could be implemented sooner than Metrorail, but would have higher capital costs and no additional ridership or economic development benefits than the Metrorail Alternative. Moreover, during conversion from BRT to Metrorail, BRT service would be displaced from the median stations in the Mid-Corridor for 15 to 18 months; during this period, BRT service would be relocated to the park-and-ride facilities. Because Phased Implementation would have greater costs, but would not offer a substantial increase in benefits, it was eliminated from further consideration.

H.4.2 TYSONS CORNER ALIGNMENTS

H.4.2.1 Alignment T1

Alignment T1 would have similar impacts to Alignment T6, because the configurations of these alignments are similar. However, Alignment T1 was eliminated from further consideration because it would include fewer stations than Alignment T6 and provide less service within the core of Tysons Corner.

H.4.2.2 Alignment T9

Alignment T9 was eliminated from further consideration because it would have greater visual effects and less operational flexibility than Alignment T6, and would potentially conflict with improvements planned at the Route 123/Capital Beltway interchange. Although Alignment T9 would have the same ridership benefits as Alignment T6 because it includes the same number of stations in the same locations, it would

have greater visual effects than Alignment T6 because most of the alignment is aerial and the stations are larger in mass due to side-platform stations. Moreover, Alignment T9 would not have pocket tracks and thus would not allow for train turnback operations.

H.4.2.3 Alignment T4

Alignment T4 would include more stations in the core of Tysons Corner and have greater geographic coverage than the other Metrorail alignments. Therefore, the alignment would have greater potential to foster the high level of development planned in Tysons Corner. However, because the four core stations on Alignment T4 would be located on one-way lines, this alignment would not necessarily provide greater transportation benefits in Tysons Corner than Alignments T6 and T9. For Alignment T4, many travelers using the one-way stations would be required to transfer and double back to reach the station within walking distance of their destination. Alignment T4 would also have much greater visual impacts than the other alignments. Because it would attract less ridership than Alignment T6, and have much greater visual effects, Alignment T4 was eliminated from further consideration.

H.4.3 YARD SITES

H.4.3.1 Yard Site 7

Though S&I Yard Site 7 would be the least expensive to construct and operate and would have fewer effects on wetlands and streams, an S&I Yard at this site would be inconsistent with existing and future land use plans and moderately incompatible with existing zoning requirements. In addition, use of S&I Yard Site 7 would result in aircraft noise effects on transit workers and potential safety issues related to airport operations (though to a lesser extent than S&I Yard Site 15). Overall, because S&I Yard Site 7 would be least consistent with existing land use, future land use plans, and existing zoning requirements and have greater negative effects on economic development in Loudoun County, it was not considered to be a practical alternative S&I Yard site and was eliminated from further consideration.

H.4.3.2 Yard Site 20

S&I Yard Site 20 is located the farthest from the mainline, requiring more non-revenue lead track and additional operational expenses. In addition, S&I Yard Site 20 would be less consistent with existing land use and future land use plans than S&I Yard Site 15, and it would have greater stream and water quality effects. Overall, because S&I Yard Site 20 would be less consistent with existing land use and future land use plans and have greater negative effects on economic development in Loudoun County, it was not considered to be a practical alternative yard site and was eliminated from further consideration.

(5) April 12, 1993

Pursuant to Section 15.2-2303(a) of the Code of Virginia, 1950 edition as amended, and approval by the Board of Supervisors of application CDPA/FDPA 89-D-060 to permit the development of up to 866 multiple family units; possible retail/office in the ground floor of residential structures, only if approved by a subsequent Final Development Plan Amendment. Transportation Facility, and a child care center, in accordance with the provisions of the PDH-20 District and the Conceptual/Final Development Plan dated October 6, 1992 and revised October 30, 1992 and revised November 10, 1992 and again revised April 1, 1993, prepared by Dewberry & Davis; and further, upon approval of the CDPA/FDPA to RZ 89-D-060, dated March 6, 1998, and revised through October 15, 1998, prepared by christopher consultants, ltd., which provides for a temporary athletic field on Land Bay 5, the undersigned hereby proffers the following conditions:

PROFFERS

PCA 89-D-060-2

November 1, 1999

Pursuant to Section 15.2-2303(a) of the Code of Virginia, 1950 edition as amended, and approval by the Board of Supervisors of application RZ 89-D-060 to permit the development of up to 866 multiple family units; possible retail/office in the ground floor of residential structures, only if approved by a subsequent Final Development Plan Amendment, Transportation Facility, and a child care center, in accordance with the provisions of the PDH-20 District and the Conceptual/Final Development Plan dated October 6, 1992 and revised October 30, 1992 and revised November 10, 1992 and again revised April 1, 1993, prepared by Dewberry & Davis; and approval of PCA 89-D-060, which provides for a temporary athletic field on Land Bay 5 and further, upon approval of PCA 89-D-060-2, as proffered herein, the undersigned hereby proffers the following conditions:

Except as modified herein, the subject property is governed by the Proffers in RZ 89-D-060, dated April 12, 1993, and the proffers in PCA 89-D-060 dated November 17, 1998 and said proffers are hereby reaffirmed. Several of these proffered conditions have already been fulfilled.

E. At the time of construction set forth in Proffers 13A. B and C. Applicant will construct Projects 0-1 and 0-3 as delineated on the County's Master Drainage Plan.

14. No later than the site plan approval for the southern entrance to Land Bay 2. Applicant will construct Dulles Greens Drive from its intersection with Innovative Avenue to a point south of the entrance to Land Bay 2 as shown on the CDP/FDP which is approximately two hundred fifty (250) feet east of the intersection, as a four (4) lane undivided roadway to VDOT standards as depicted on the CDP/FDP.

15. A. Dedication.

Applicant will dedicate and convey in fee simple Land Bay 5, in the southeastern portion of the Property, as more particularly depicted on the CDP/FDP, to Fairfax County or its designee for use as a temporary athletic field and/or as a public transportation destination station, Kiss & Ride lot, Park and Ride facility, rail/bus transit station or other public transportation facility (herein referred to a "Transportation Facility"). At the time of dedication necessary easements shall be granted or assigned (at no cost to the County) by Applicant.

The following associated and/or ancillary uses, not to exceed a total of 2,500 square feet may be included as an integral component of a structure/facility that provides any of the uses set forth above:

1. Ticket sales for public transportation facilities
2. Office for administration of the Park and Ride facility

facilities shown on the CDP/FDP. All lighting of active recreation facilities shall be shielded and directed on site so as to keep glare from projecting off-site or into on-site residential areas.

All waste water resulting from the cleaning and draining of the pool located on the site shall contain a minimum dissolved oxygen concentration of 4.0 milligrams per liter prior to discharge. The Applicant shall neutralize pool waters to a pH from 6.0 to 9.0 prior to discharge. Sufficient amounts of lime or soda ash shall be added to achieve a pH approximately equal to that of the receiving stream.

If the water being discharged from the pool is discolored or contains a high level of suspended solids that could affect the clarity of the receiving stream, it shall be allowed to stand so that most of the solids settle out prior to being discharged.

This proffer #17 shall not apply to the proposed temporary athletic facility located in Land Bay 5.

18. Land Bay 5 shall be developed as a temporary athletic facility in accordance with CDPA/FDPA 89-D-060. Applicant's/Profferor's cost to complete this facility in accordance with CDPA/FDPA 89-D-060 shall not exceed the sum of $191,742.00, plus adjustments for inflation from September 10, 1992 until the date of completion of the facilities, or the date of full expenditure of said fund after adjustment for inflation, whichever event first occurs. This athletic facility will terminate at such time as a Transportation Facility is under construction for utilization on the site.

1.0 PURPOSE AND NEED FOR THE PROPOSED ACTION

A. Draft EIS Comments

State Agency Comments

Need to Service Growth at Dulles Airport

State Comment: With the addition of a fourth runway and other major airport improvements and passenger amenities, Washington Dulles International Airport is poised for significant growth. Forecasts for passenger trips for 2010 have been increased from 30 million 37 million, an increase of more than 20 percent. Forecasts for 2025 have been increased from 55 to 63 million passenger trips. The Dulles Center of the National Air and Space Museum will open in December 2003 and is expected to generate three to five million visitors per year. While these visitors should be able to use transit, the growth of jobs in the hotel and restaurant and service industries will also bring additional employees and visitors to the area who could benefit from rail transit. (0131, 0131-T –6)

> ***Response:*** *As noted in Chapter 1 of the Final EIS, increasing air travel and employment at Dulles Airport are important factors underlying the need for rapid transit improvements in the Dulles corridor. The project goals and objectives outlined in Table 1.6-1 of the Final EIS include more frequent service for trips to Dulles Airport as well as other regional activity centers.*

Need to Service Growth in the Corridor

State Comment: Development in the corridor has proceeded more quickly than forecast. Twice as many jobs were created in the Dulles corridor as in the rest of the region over the last decade, fueling construction of office space. Regional forecasts indicate that the corridor will continue to grow at nearly double the rate of the rest of the region in employment and residents, adding 206,000 people, an increase of 56 percent, and 203,000 jobs, a 71 percent increase in employment levels, over the next 25 years. While vacancy rates and office space are high now, there is no doubt in my mind that this region will see the energy and entrepreneurship of our local business community lead us into new and promising directions that we will see business form and grow. (0131, 0131-T –4)

State Comment: We have problems to solve and they include, among other things, congestion, air quality, growth. But we want to, I would suggest to you, simply not solve these problems for today, we want to solve them for the long-term future. I would say to you that I speak today also in another capacity, in that of being a grandfather. My son Christopher, sitting here on the front row, and I want us to solve the problems not simply for me and for us today, but for Christopher and the other people who will live in our communities in the future. (0131, 0163-T –4)

> ***Response:*** *As outlined in detail in Chapter 1 of the Final EIS, the purpose of the Dulles Corridor Rapid Transit Project is to provide transit system enhancements that would provide a direct connection to the existing Metrorail system. These enhancements would offer an alternative means of travel for the growing number of residents, employees, and visitors in the Dulles corridor as well as a high quality transit link to the Metrorail system, to improve mobility throughout the region. These proposed improvements will address the issues raised in the comments listed namely improving transportation service, providing an alternative mode of travel to that of the automobile, increasing transit ridership, and supporting current and future population growth and development in the Dulles corridor and region.*

Regional Agency Comments

Need for Connections Between Dulles Airport and the District of Columbia

Regional Comment: Rail between the region's designated international airport and the national capital is long overdue. As other people have already said, Dulles airport is expected to increase passenger trips from 20 million in 2000 to 37 million by 2010, and expects to double the number of employees from 15,000 to 30,000. The Dulles Center of the National Air and Space Museum projects 3 to 5 million visitors per year when it opens in December 2003. (0132, 0132-T –3)

> ***Response:*** *As noted in Chapter 1 of the Final EIS, increasing air travel and employment at Dulles Airport are important factors underlying the need for rapid transit improvements in the Dulles corridor. The project goals and objectives outlined in Table 1.6-1 of the Final EIS include more frequent service for trips to Dulles Airport as well as other regional activity centers.*

Need to Provide Access to Jobs

Regional Comment: Commuters from the urban core and other parts of the region need to be able to reach jobs at Tysons, in the corridor, and at Dulles airport. Commuters from the growing western perimeter of Washington need access to jobs in other parts of the metropolitan area as well as in the corridor and at Tysons, and air travelers need to be able to reach Dulles airport by transit from any part of the metropolitan area. (0132, 0132-T –4)

> ***Response:*** *As outlined in detail in Chapter 1 of the Final EIS, the purpose of the Dulles Corridor Rapid Transit Project is to provide transit system enhancements that would provide a direct connection to the existing Metrorail system. These enhancements would offer an alternative means of travel for the growing number of residents, employees, and visitors in the Dulles corridor as well as a high quality transit link to the Metrorail system, to improve mobility throughout the region. These proposed improvements will address the issues raised in the comments listed, namely improving transportation service, providing an alternative mode of travel to that of the automobile, increasing transit ridership, and supporting current and future population growth and development in the Dulles corridor and region.*

Need for Design Flexibility to Meet Regional and Local Needs

Regional Comment: The Dulles Corridor has the potential to become one of, if not the most heavily used section of the region's Metro rail system. The potential is conditioned upon:

a) Effective service from the entire Corridor to Tysons Corner;
b) Optimization of the transit system with land use, including the future evolution of mixed use air rights developments above stations where such developments would enhance county objectives and where they would be compatible with neighborhood desires;
c) Careful integration of stations with their surrounding land uses such that the maximum number of people are attracted to transit from the automobile;
d) Journey times for the commuter, which over the longer distances at least, are comparable or superior to automobile travel during the peak hour times projected for 2025 and beyond;
e) A service oriented system that meets the requirements of the sophisticated, well-educated denizens of the Dulles Corridor.
f) A system that is operated as a transportation system designed to attract ridership rather than as a heavily subsidized social service - the normal attitude toward transit.

Requested Action: Provide flexibility in the locally preferred alternative to enable the design team to meet these objectives. (0133, 0405-L –3)

Response: *Comment noted. Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles corridor and region are important to us and have been considered by decision-makers in the selection of the Locally Preferred Alternative (LPA).*

Local Agency Comments

Need to Meet Mobility Accessibility Goals

Local Comment: But what is more important here is that unless these issues are addressed successfully, this will not be a project that works for the citizens of this region. We note that in the handout this evening that one of the objectives is to increase mobility and accessibility, and another key objective is to accommodate future increases in transportation demand. We certainly now and in the past and will be in the future are committed to achieving those objectives along with our colleagues and those others who share the region with us. (0165, 0165-T –4)

Local Comment: We are absolutely committed to the objectives of increased mobility and accessibility, we are absolutely committed to mass transit, and we have shown it in every way possible. We do tonight and we will in the future, and we certainly want to accommodate future increases in travel demand more effectively than we have been able to in the past. (0165, 0165-T –9)

Response: *As described in Chapter 1 of the Final EIS, goals for the Dulles Corridor Rapid Transit Project include improving transportation service, increasing transit ridership, and supporting future development and environmental quality, among others. These goals correspond to many of the objectives cited by the commenters.*

Need to Serve Population and Employment Travel Demand

Local Comment: Mr. Chairman, we stand at a critical moment in Fairfax County's history. The last two decades elected officials, government agencies, and the public have talked about extending rail to and through Tysons Corner on the way to Dulles. While that was taking place, Tysons Corner grew up. Businesses flocked there, creating over 30 million square feet of office space and lots of retail space and bringing in close to 100,000 jobs every day. Millions of people began visiting Tysons Corner Center and Tysons II and it became a retail center for the region. Tysons Corner grew to become a business district that if it was its own city would be larger than the commercial and retail spaces of Baltimore, St. Louis or Miami. All of this economic success, however, has not come without a price. Without mass transportation, all of these workers and visitors are forced to travel, by and large, to Tysons by automobile. Finally, after years of talking, we have reached the point to take some action. We are ready to bring mass transit to Tysons and the Dulles corridor. We must move forward. (0130, 0130-T-1)

Local Comment: The Mid-Corridor of the DCRTP consists largely of Hunter Mill District, from Tysons Corner to Dulles International Airport. This area comprises over 120,000 residents, 12 million square feet of office space and six of the nine proposed rail station locations. Today, many of these residents, employers and employees face inconvenience, diminished quality of life and the risk of economic stability as they await relief from congestion in their communities. While there are concerns that must still be addressed in the Final EIS, it is now time for federal, state and local officials to respond to the transportation needs of this community by supporting the DCRTP. (0437, 0437-E –2)

Local Comment: The current density and size of Tysons Corner justifies the extension of transit now. Predicted growth in jobs and retail space only underscores the urgent need for mass transportation. Equally as important is growth in the number of residents in Tysons Corner that has occurred and will continue to occur as Fairfax County encourages increased transit-oriented residential development pursuant to the 1994 comprehensive plan. It is imperative that mass transit be provided to serve these people and our future residents in Tysons Corner. (0130, 0130-T –3) (0130, 0289-T-3)

Local Comment: Washington, D.C. is one of the only capitals in the industrialized world whose international airport is not served by rail. Demand for a rail link to Dulles will only increase as travel volume is expected to grow to nearly 32 million passengers by 2010. The opening of the new Air and Space Museum next year will attract millions of tourists in that corridor, and if we needed a reminder about how important rail was, the events of September 11th were a wake-up call. When the Federal government decides to close the other airport, National, Reagan Airport, and the spillover has to go to Dulles, we need help from the Federal government and we need it now in getting a rail link to Dulles airport. By 2020, Tysons Corner and the Dulles corridor will be the second largest employment cluster in all of metropolitan Washington, next only to the core in Washington, D.C. That's an astounding statistic. If we fail to act now and we don't provide multi-modal transportation alternatives, growth in jobs and population will only make congestion much worse. We cannot afford to be a victim of our own success. We cannot let the high quality of life that's attracted so many of us and the jobs to Fairfax County in the first place be undermined by that traffic congestion. (0130, 0130-T –7)

Local Comment: And yet unless the issues are addressed which we have outlined in our written submission and we have talked about this evening, this will be like a beautiful, attractive island surrounded by a sea of sharks that you can't get to. (0165, 0165-T –5)

Local Comment: By 2020 Tysons Corner and the Dulles corridor will be the second largest employment center in the region (second only to downtown D.C.). If we fail to act and provide multi-modal transportation alternatives, growth in jobs and population can only make traffic congestion on our area roadways worse. We cannot afford to be a victim of our own success, we cannot let the high quality of life that attracts so many people and jobs to Fairfax County in the first place be undermined by traffic congestion. (0130, 0289-T –6)

Local Comment: We stand at a pivotal moment in Fairfax County's history. For the last twenty years, elected officials, government agencies, and the public have talked about extending rail through Tysons Corner to Dulles Airport. While that was taking place, Tysons Corner grew up: businesses flocked there creating 30 million square feet of office space and close to 100,000 jobs and more than 20 million people began visiting Tysons Corner Center and Tysons II annually. Tyson's Corner grew to become a business district that, if it was its own city, would be larger (in terms of employment) than St. Louis or Miami. All of this success, however, has not come without a price. (0130, 0289-T –1)

> ***Response:*** *As outlined in detail in Chapter 1 of the Final EIS, the purpose of the Dulles Corridor Rapid Transit Project is to provide transit system enhancements that would provide a direct connection to the existing Metrorail system. These enhancements would offer an alternative means of travel for the growing number of residents, employees, and visitors in the Dulles corridor as well as a high quality transit link to the Metrorail system, to improve mobility throughout the region. These proposed improvements will address the issues raised in the comments listed namely improving transportation service, providing an alternative mode of travel to that of the automobile, increasing transit ridership, and supporting current and future population growth and development in the Dulles corridor and region.*

Need for a "World Class" Transit System

Local Comment: Most importantly, a Dulles Corridor Rapid Transit Project (DCRTP) should provide a world class, comprehensive transit system, which will allow the Dulles Corridor and its surrounding communities to contribute to the ease of transportation in the capitol region. In addition, the project will connect Dulles Corridor to Dulles International Airport, which is vital to the continued growth and development of the region. (0437, 0437-E –1)

> ***Response:*** *Comment noted. Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles corridor and region are important to us and have been considered by decision-makers in the selection of the Locally Preferred Alternative (LPA).*

Public Comments

Need to Provide Transportation Enhancements and Travel Choices

Public Comment: As the population in Virginia increased, especially in the Northern Virginia area, from new businesses to new homes, very little was done in conjunction with this growth to handle the increase of commuters. The Tysons Corner area is a perfect example of this. As this area grew and expanded onto every available piece of real estate, nothing was done to ease congestion. No thought was given as to how to keep the congestion outside of the Tysons Corner area. Virginia and the businesses should have combined to develop a transit system around the Tysons Corner area and within to keep the vehicles out. At the time all the new corporations were building this would have been a perfect partnership. (0123, 0123-L –1)

Public Comment: So my bottom line in all that is I think that probably we will find the traffic congestion is as good as it's ever going to get in the Northern Virginia region on the whole, and that what we have to do is build for the future capacity and hope that we can stay in terms of transit times as good as we have right now. I think that the physics make that very difficult to just meet that goal. (0258, 0258-T –1)

Public Comment: As a long time commuter in this area, I know that traffic congestion in the DC area, especially the Dulles corridor is always congested. Anything you can do to alleviate this problem would be a great help. (0019, 0019-E –2)

Public Comment: Proposal merely connects several points along the greenway but it fails to establish any transportation means between these points where most of the needs are. (0094, 0094-CC-1)

Public Comment: This area is still dependent on local automobile use and this important need has not been addressed. (0094, 0094-CC-2)

Public Comment: BRT and/or Metro proposals appear to be good and proper by themselves (i.e., between stations) but this is not the problem. The problem is that the present development in the area developed because of and is dependent on the automobile and BRT and Metro will not change this situation. (0094, 0094-CC-3)

Public Comment: What we've got out there now are office parks, single-use office parks, and you can't do a darn thing without getting into your automobile. (0141, 0141-T –2)

> ***Response:*** *The purpose of the Dulles Corridor Rapid Transit Project is to improve mobility throughout the region by providing transit system enhancements that would offer an alternative means of travel for the growing number of residents, employees, and visitors in the Dulles corridor, and as a link to the Metrorail system. In a similar way the Northern Virginia 2020 plan, the Statewide Transportation Plan, and county comprehensive plans detail the roadway and transit improvements planned to address the current and future transportation needs in Fairfax and Loudoun counties. As outlined in Chapters 2 and 6 of the Final EIS, these current and future transportation needs have been incorporated into the analysis of both No-Build and two Build Alternatives (Wiehle Avenue Extension and the Full LPA). In addition, the operating plans for the two Build Alternatives include local and feeder bus service.*

Need to Service Dulles Airport

Public Comment: The Dulles rail corridor clearly already serves today as a critical gateway to our Nation's capital. Just 26 miles from downtown Washington, Dulles airport provides daily nonstop service to more than 75 cities and direct service to over 30 foreign countries. Additional cities will be added by 2012. (0153, 0153-T –2)

Response: *As noted in Chapter 1 of the Final EIS, increasing air travel and employment at Dulles Airport are important factors underlying the need for rapid transit improvements in the Dulles corridor. The project goals and objectives outlined in Table 1.6-1 of the Final EIS include more frequent service for trips to Dulles Airport as well as other regional activity centers.*

Need to Support Future Development While Maintaining Environmental and Community Quality

Public Comment: The Coalition for Smarter Growth is a coordinated effort of environmental, civic and transit groups in the Washington, D.C. region. We advocate continued urban revitalization and the focusing of regional growth in transit-oriented centers and other town centers that are mixed use and pedestrian and bicycle-friendly. Analysis demonstrates that this will be the most effective way to reduce regional traffic congestion. One of those analyses is Network of Liveable Communities, a report by the Chesapeake Bay Foundation, which found that if we revitalize Washington, D.C. and use transit-oriented development regionwide, we can significantly reduce vehicle miles traveled and regional congestion. (0149, 0180-T –1)

Public Comment: The Greater Washington Board of Trade is the regional chamber of commerce for Northern Virginia, the District of Columbia, and suburban Maryland, and represents businesses and nonprofits that employ over 40 percent of the private sector workforce in our region. We are committed to the efficient movement of people and goods and the high quality of life that a good transportation system can provide. (0142, 0142-T –1)

Public Comment: The Reston Citizens Association enthusiastically supports the statement of the Dulles Rail Now coalition for all of the many reasons offered in supporting statements presented at the hearings. These include arguments regarding (a) the high capacity, (b) the high ridership, particularly the high "new riders" whose switch to transit yields so much in the way of congestion relief and environmental benefits, (c) the ability to accommodate new growth without excessive congestion, (d) the greater mobility provided to the transit-dependent, and (e) the importance of having the rail link to the nation's capital. (0478, 0484-E –1)

Response: *As described in Chapter 1 of the Final EIS, goals for the Dulles Corridor Rapid Transit Project include improving transportation service, increasing transit ridership, and supporting future development and environmental quality, among others. These goals correspond to many of the objectives cited by the commenters.*

Need to Support Future Growth and Travel Needs

Public Comment: Our community, our whole community, needs public transit in the Tysons-Dulles Corridor and we need it now. (0157, 0157-T –1)

Public Comment: We are writing to express interest in the Dulles Corridor Rapid Transit Project which should be of help as part of the solution to the area's traffic congestion. (0483, 0483-E-1)

Public Comment: We have heard people talk about some of the growth statistics, but maybe it's worth mentioning a little bit again how large, how Tysons Corner has grown up and is now a place of 30 million square feet of office space. Even Reston and Herndon combined have as much office space as Tysons Corner does. There's plenty of growth out in the Route 28 area, and we have heard about what's happening at the airports, even despite the terrorists attacks. International travel has increased and we are seeing increasing flights out there at Dulles International Airport. (0141, 0141-T –1)

Public Comment: We face a future that will include many new residents and jobs. Over the next 25 years the Greater Washington region will add 1.4 million people, 32 percent increase, and 1.1 million jobs, 39 percent increase. In the Dulles corridor alone, this increase will amount to an additional 206,000 people, an increase of 56 percent, and 203,000 jobs, a rate of growth nearly twice the rate of the region as a whole. For purposes of perspective, this rate of growth will be equivalent to the corridor accommodating the populations of Arlington and the city of Fairfax and approximately the number of workers who are currently employed in Loudoun, Prince William, and Manassas. At the same time, the council of government also forecasts that vehicle miles traveled, VMT, in our region will increase by 46 percent by 2025, while freeway and arterial lane miles are forecast to increase by only 13 percent, a recipe for further gridlock compounding our current ranking as the Nation's third most congested region. (0142, 0142-T –2)

Public Comment: We face a future that will include many new residents and jobs. Over the next 25 years the Greater Washington region will add 1.4 million people (+32%) and 1.1 million jobs (+39%). In the Dulles corridor alone, this increase will amount to an additional 206,000 people (+56%) and 203,000 jobs (+71%) - a rate of growth nearly twice the rate of the region as a whole. For purposes of perspective, this rate of growth will be equivalent to the corridor accommodating the populations of Arlington and the City of Fairfax and approximately the number of workers who are currently employed in Loudoun, Prince William and Manassas. At the same time, the Council of governments also forecasts that vehicle miles traveled (VMT) in our region will increase by 46% by 2025, while freeway and arterial lane miles are forecast to increase by only 13 percent - a recipe for further gridlock compounding our current ranking as the nation's third most congested region. To complicate this problem, our region has severe air quality problems, and we are struggling to meet the requirements of the Clean Air Act. As you may know, today was a "code orange" day, indicating poor air quality - one of 12 this year already. In addition, we have already had four "code red" days - those days when air quality is at its worst. If we cannot reach our air quality goals we run the risk of losing billions of federal transportation dollars, while allowing the increased health risks of breathing polluted air. (0142, 0219-M –1)

Public Comment: All of us are being inconvenienced. We are being inconvenienced by unbearable traffic and pollution, inconvenienced by the lack of consideration for pedestrian amenities, and lack of consideration for our residential communities as we continue to increase zoning densities and attempt to expand roads into mega-facilities to service those increased densities. It may have been unintended, but we have planned and zoned our way out of the ability to rely on the automobile. Now the only choices that we have left are the tough choices involved in planning rational alternative transportation systems for the future. And the future is an integrated transportation plan serving the most people most effectively. (0148, 0148-T –7)

Public Comment: After September 11 last year, the Congress of the U.S. saw firsthand the transportation problems that exist in our region when the city of Washington was not able to be timely evacuated in response to the terror attacks. The metro system did work on that day in the midst of traffic gridlock. (0144, 0190-T –1)

Public Comment: Analysis demonstrates that this will be the most effective way to reduce regional traffic congestion. Changes to land use are also the fastest thing we can do to cut vehicle miles traveled and are critical for making transit work. (0149, 0149-T –1)

Public Comment: This is all about vision. Two pieces of vision. What is Fairfax now, and what do we want it to become, and how is the process for what is it going to become being made to happen? (0191, 0191-T –1)

Public Comment: As someone who manages human resources for a company with 110 employees located in Tysons Corner, I can't tell you how many times I hear from our employees about the miserable traffic in our region. While we offer flexible working hours to try and alleviate this problem for our employees, it only helps so much. Many of our employees are located at the Dulles Toll Road and most of them have indicated they would use a rail system if it were available. (0393, 0393-L –2)

Public Comment: Bringing transit to the Dulles corridor from West Falls Church to Loudoun County has long been discussed as a necessary transportation initiative in Northern Virginia. Tysons Corner and the Reston-Herndon-Dulles Airport-Eastern Loudoun corridor are two of the largest employment and residential centers in the country with the Council of Governments forecasting significant additional jobs and residential growth in the corridor through 2025. Currently planned transportation improvements will be unable to accommodate the projected growth (71% increase in jobs and 56% increase in population) without implementation of expanded transit options to compliment the baseline projects. Advocates on behalf o Washington Dulles International Airport have long desired rail access. (0396, 0396-L –2)

Public Comment: The Federation supports the concept of rapid transit service in the Dulles corridor. Rapid transit service has long been needed in this corridor because of the existing and projected communities, non-residential development, and employment centers along and beyond the corridor that would most efficiently be served by transit. This would reduce the disparity between development and supporting transportation infrastructure. (0402, 0402-L –1)

Public Comment: Our organization has held the longstanding position that the lack of adequate mass transit options for commuters living and working in Northern Virginia's employment and population centers represents a key shortfall of the Washington metropolitan region's transportation system. Nowhere is this deficiency more glaring than in Tysons Corner and the Dulles corridor which collectively represent approximately 300,000 residents and 182,000 jobs. With respective population and employment increases of 56 and 71 percent projected over the next 25 years in the business districts fueling Northern Virginia's economic engine, additional strain will be placed on the region's already congested traffic conditions and region's air quality. For this reason, the provision of integrated mass transit service to Tysons Corner and throughout the length of the Dulles corridor in addition to a baseline roadway and transit network improvements is necessary to sustain the Washington metropolitan region's economic vitality and to facilitate the efficient movement of people and goods throughout the region. (0233, 0426-M –37)

Public Comment: An integrated Metrorail system is critical to the quality of life in the Dulles corridor as it would limit future congestion on our already overcrowded highways. It would further allow our business community to develop with increased flexibility and reliability of transportation for the work force. Shifting vehicle traffic to public transportation will also have a very positive effect on air quality. (0027, 0027-L –3)

Public Comment: I agree completely that something has to be done about the traffic situation in the Tysons Corner area and I do believe we need more public transportation including a means for getting to Dulles International Airport, expeditiously. (0085, 0085-L –1)

Public Comment: Whether we like it or not this area is growing beyond all previous plans or expectations. There are way too many cars on our roads. People are looking for alternate ways to travel from point to point. Roads have been widened taking homes and trees as the expansion occurs without regard for the environment. (0098, 0098-E –1)

Public Comment: The parking at Tysons Corner and Dulles Airport is often difficult and expensive. The bus service is not that great. It is practically impossible to walk to most public places because of the great distances. Some form of transportation is needed to make this area accessible to everyone including the workers who cannot afford to live close to their jobs and do not even have a car. (0098, 0098-E –3)

Public Comment: A diversified transportation is the only way to relieve congestion on the roads, an increase everyone's quality of life. It is time America caught up with the rest of the world in this regard. (0103, 0103-E –3)

Public Comment: I think something has to be done to alleviate congestion and encourage the use of public transportation to get cars off the road. But I don't know if the current plans are the answers. (0011, 0011-E –2)

Public Comment: Finally, the effort to bring the 2012 Olympics to the Metropolitan area, the opening of the Air-Space Museum Annex at Dulles, and the need to increase the ways of improving dispersion of the population in case of further attacks on the regional core are collateral benefits for completing the Rail to Dulles Project as soon as possible, but they are not integral to the need for rail. Rail is needed to address the needs of the citizens to get from here to there without wasting inordinate amounts of time sitting in a SOV consuming non-renewable resources and aggravating air quality. (0208, 0208-M –7)

Public Comment: Since I don't think -- since the commute times will be so long on this rail or bus system, I don't think it will benefit me from a time standpoint. I do think it's necessary to have some sort of transportation system to the Dulles area, though. (0262, 0262-T –3)

Public Comment: This area desperately needs more public transit, to improve the air we breathe, to get drunk drivers off the road, to get us to work in a stress-free, productive way - the reasons go on and on. (0232, 0232-L –1)

> ***Response:*** *As outlined in detail in Chapter 1 of the Final EIS, the purpose of the Dulles Corridor Rapid Transit Project is to provide transit system enhancements that would provide a direct connection to the existing Metrorail system. These enhancements would offer an alternative means of travel for the growing number of residents, employees, and visitors in the Dulles corridor as well as a high quality transit link to the Metrorail system, to improve mobility throughout the region. These proposed improvements will address the issues raised in the comments listed namely improving transportation service, providing an alternative mode of travel to that of the automobile, increasing transit ridership, and supporting current and future population growth and development in the Dulles corridor and region.*

Potential Need to Service 2012 Olympic Games

Public Comment: We urge that all steps be taken to expedite a decision as soon as possible. The greater Washington area is a candidate for the 2012 Olympic Games, an event that could showcase the area as a premier place to live and work. Should the decision be made to move ahead with a rail system that would be fully installed prior to the 2012 games, our bid would be greatly enhanced. Even if the area is selected after the rail decision is made, a fully functional system by the time the Olympics arrive would provide an efficient mode of transportation that would be both expected and appreciated by the world community as well as our own area residents. (0027, 0027-L –4)

Public Comment: And in 2012, thousands upon thousands of the arrivals will be international visitors, spectators, athletes and members of the worldwide Olympic family. Easy rail access from major airports is a hallmark of most international capitals. As perhaps the world's greatest capital, Washington, D.C. can provide no less direct service and access to its multiple Olympic venues and visitor attractions, especially if our bid is to win the 2012 Olympic host city designation to be awarded in 2005, only a few years from now. (0153, 0153-T –3)

> ***Response****: With the region no longer in contention to host the 2012 Olympic Games, Olympic travel demand was not a factor in determination of the Locally Preferred Alternative.*

Public Comment: And in 2012, thousands upon thousands of the arrivals will be international visitors, spectators, athletes and members of the worldwide Olympic family. Easy rail access from major airports is a hallmark of most international capitals. As perhaps the world's greatest capital, Washington, D.C. can provide no less direct service and access to its multiple Olympic venues and visitor attractions, especially if our bid is to win the 2012 Olympic host city designation to be awarded in 2005, only a few years from now. (0153, 0153-T –3)

> ***Response****: With the region no longer in contention to host the 2012 Olympic Games, Olympic travel demand was not a factor in determination of the Locally Preferred Alternative.*

Importance of Seamless Service and Effects of Modal Transfers

Public Comment: It is occasionally cited that one of the main advantages offered by Metro was that it would offer seamless service to/from Dulles Airport and that changing modes at Falls Church, such as to monorail, would decrease ridership. This assumption is questionable and particularly so if a lower system cost structure permits a meaningful lower fare. Structure and elimination or reduction of the need for a subsidy. I have ridden Metro for years and frequently changed modes - Yellow Line to Blue, Blue to Orange or Red, etc. This never kept me or my colleagues from using our fine Metro system. (0266, 0390-M –2)

> ***Response:*** *As described in Chapter 6 of the Final EIS, the number of transfers required to make a trip from an origin to a destination is one of the most important determinants of passenger convenience and comfort. Research shows that there are several reasons transfers decrease the attractiveness of a transit service. The added time associated with transfers increases a passenger's overall trip time. Also, there is a discomfort associated with uncertainty about the arrival of the vehicle being transferred to, specifically whether the vehicle will be early (and therefore missed by on-time arriving passengers), late, or will arrive at all.*
>
> *Intra-system transfers (like transferring from one Metrorail line to another) make much of the burden typically associated with a transfer between two modes less onerous, but still require moving between platforms and does not provide the convenience of a one-seat ride. Therefore, this type of transfer would still affect ridership levels.*
>
> *As described in Chapter 8, it is assumed in the Final EIS that the two Build Alternatives of Wiehle Avenue Extension and Full LPA would use the same fare structure as the existing Metrorail system and that this fare would be adjusted for inflation over time. Currently the maximum fare on the Metrorail system is $3.90. For trips between most parts of the corridor and Arlington and the core, the maximum fare would apply. In addition, parking fees would apply at the Project's Metrorail stations.*

Need for Transit Service to Support Local Conditions

Public Comment: Fortunately, the Dulles corridor transit project offers us a very important option in linking our land use and transportation needs. Transit in the Dulles corridor is one of the board of trade's top transportation priorities. (0142, 0142-T –5), (0142, 0219-M –2)

Public Comment: Boston Properties is the owner and developer of the 162-acre Broad Run Technology Park located between the AOL Time Warner and MCI WorldCom campuses. We have completed one of the nine master planned buildings and the Park has an office development capacity of over one million square feet. In addition, Boston Properties has completed over three million square feet of development in the Northern Virginia Technology Corridor and has over 15 million square feet either completed or planned in the Washington Metropolitan area. Given this magnitude of office development in the Northern Virginia area, we are highly supportive of the efforts to bring rapid transit to the Dulles corridor. (0003, 0003-L –1)

Public Comment: I believe that public transportation is the only way to go to deal with the increased population in Fairfax County. Having lived in Europe for nearly 9 years, I have experienced the advantages of public transportation. The time is right for mass transit along the Dulles Corridor. The population density is high enough to warrant public transportation. I also believe that the benefits mentioned below clearly outweigh the costs:

- Reduced emissions - leads to reduced ozone- better quality of life.
- Reduced traffic jams - better quality of life.
- Reduced commuting times - higher productivity & better quality of life.
- Alternative means of transport for the disabled/elderly.

Please do consider implementing this project sooner rather than later. (0077, 0077-CC-1)

Public Comment: The National Capital Area League of Women Voters was founded to provide a forum for study and action on transportation policy in the Washington Metropolitan Area. We were among the earliest and most enthusiastic supporters for building a mass transit system. We have many positions that favor expansion of this system, addressing issues of access, safety, social equity, environmental quality, sound land use planning, regional governance, and public participation in decision-making. (0206, 0206-M –1)

Public Comment: Very happy to see public transit coming to Loudoun. I am a big supporter as someone who works in DC. The sooner the better. Please let me know if I can be involved. (0272, 0272-I –1)

Public Comment: Let me be very specific. I support the alternate transportation being considered in this process. However, we have only one opportunity to get this - get it right. Whether it is rapid rail or bus rapid transit, it needs to work for the greatest number of people. We must not get - we must get, we the people, out of our automobiles and onto the integrated public transportation system. (0148, 0250-T –1)

Public Comment: I endorse the establishment of alternative means of transportation to include rapid rail and/or bus rapid transit serving the Dulles Corridor and airport communities. Either seems to be a quite desirable capability, and now with the gridlock an absolute necessity. But it is only a good thing if it can be built and is actually used. (0148, 0148-T –1)

Public Comment: The following are some of our specific concerns:

- 2010 is a long time to wait for service.
- We may run out of money before we get there.
- Too much State and County funding is coming from the Corridor itself, since the benefits are shared throughout the region.
- The General Plans do little to help knit together north and south Reston.
- Increased densities may appear before Metrorail service and mitigation plans are implemented.
- Pedestrian and bicycle access is not yet adequately addressed. (0210, 0210-M –3)

Public Comment: We just have suffered through the dot com bust where we had the dot com bubble, and of course what happened during the dot com bubble is a lot of people invested a lot of money, ignored profitability and fundamentals, and I would suggest that as we march forward with this type of project, because I do think we need mass transportation in the Dulles corridor, and we need to do it the most cost-effective way possible, but we ought to get the fundamentals right. (0136, 0168-T –1)

Public Comment: The Northern Virginia transportation line strongly supports a balanced regional network that includes improved Dulles corridor transit. The issue is what priorities do the most to reduce congestion and when these investments should be made. (0446, 0146-T –2)

Public Comment: Recognizes the concerns of many people regarding growth in the area. Fully supports preserving open spaces and historical sites, however the growth is inevitable, so responsible planning is necessary for the future. Believes that the Dulles Corridor Rapid Transit Project is an important part of an integrated growth strategy and should be pursued. (0036, 1-01)

> ***Response:*** *Comment noted. Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles corridor and region are important to us and have been considered by decision-makers in the selection of the Locally Preferred Alternative (LPA).*

Relationship to Other Transportation Studies/Projects

Public Comment: That is particularly important, as I will note for the record. There is an ongoing beltway DEIS that has other impacts on the mall property that we would encourage WMATA and the Commonwealth to consider as well. These projects are not in isolation but in fact work together. (0143, 0143-T –6)

> ***Response:*** *The Capital Beltway Improvements Draft EIS presents several alternatives that are under consideration. At the time of the Final EIS, a preferred alternative has not been determined. If a preferred alternative had been selected in time for incorporation into the Final EIS, the exact interactions with the mall would have been included in the secondary and cumulative effects analysis in Chapter 9 of the Final EIS. The Dulles Corridor Rapid Transit Project, now in preliminary engineering, is being coordinated with the Virginia Department of Transportation, which is conducting the Capital Beltway study, in order to ensure that the two projects will accommodate the each other and that all impacts are considered.*

Public Comment: At the Tyson station areas, there is a need for refinement of station locations while considering the eventual interconnection with a Purple Line linked to Metro at Dunn Loring and points in Maryland. (0158, 0475-L –9)

> ***Response:*** *Connections to the future transit improvements cited in this comment were considered under the Metrorail Alternative, Alignment T3. This alignment was evaluated in technical memoranda prepared during Initial and Intermediate screening. The plans for these future transit improvements are not at a level that would make it appropriate or feasible to conduct detailed coordination efforts related to those improvements. Given these findings, Alignment T3 was not carried forward. Now that the Metrorail Build Alternative has been selected as the LPA, DRPT and WMATA will continue to fully cooperate and participate with the coordination efforts of the groups studying these future transit improvements.*

Project Purpose, Goals, and Outcomes

Public Comment: That DEIS goals do not include traffic congestion reduction. In fact, the DEIS says that no transit alternative considered reduces corridor or regional congestion. (0446, 0218-M –4)

Public Comment: What is the purpose of rail to Dulles? If to reduce traffic congestion, the present study shows that it will increase it. Why? (0189, 0448-E –9)

Public Comment: That the goals do not include improved corridor vehicular travel times. In fact the DEIS says that travel times for most corridor travelers are not improved by this project. (0446, 0218-M –5)

Public Comment: Other DEIS items the alliance finds of concern are, one, that the goals do not include traffic congestion reduction. In fact, the DEIS says that no transit alternatives considered reduces corridor or regional congestion; that the goals do not include improved corridor vehicular travel times. In fact, the study says that travel times for most corridor travelers are not improved by this project. (0446, 0146-T –5)

Public Comment: No one seriously contends that even after spending all this money traffic congestion will be less than it is now. Why don't we spend just a fraction of this money in ways that we know will reduce congestion? (0162, 0162-T –4)

Response: *As identified in Chapter 1 of the Final EIS, the goals for the Dulles Corridor Rapid Transit Project include improving transportation service and increasing transit ridership, among others. One of the project purposes is to provide an alternative to auto travel to help meet increases in travel demand. However, the commenter is correct in stating that the two Build Alternatives of the Final EIS would not reduce traffic on most regional roadways. As shown in Section 6.2.3, only volumes on the DIAAH decrease enough to result in an improved level of service. The Metrorail extension, in combination with the planned transit-oriented urban form, will help to increase overall mobility in the corridor, the counties, and the region. Furthermore, it will increase overall transportation capacity and person throughput in the corridor.*

Consideration of Regional Context

Public Comment: Achieving higher transit ridership, creating additional transit capacity and constructing stations around which to focus future densities are laudable goals. However, Dulles transit is a huge, complex issue that also must be looked at in a larger regional context. Something the Draft Environmental Impact Document (DEIS) doesn't do. (0446, 0218-M –2) (0446, 0146-T-3)

Response: *Though many of the effects considered in the Final EIS are related to corridor-level impacts, the evaluation also includes anticipated impacts on regional transit ridership, roadways, and air quality. Other highway and transit improvements that would address the existing and potential future deficiencies in Northern Virginia's transportation system are recommended in the Northern Virginia 2020 Plan, the Statewide Transportation Plan, and local comprehensive plans. This program of improvements is being evaluated and developed by VDOT, DRPT, and others.*

Effectiveness in Addressing Suburban Transportation Needs

Public Comment: States that the selected Locally Preferred Alternative is based on an incomplete and flawed analysis, and that it does not solve the suburban transportation problem that it is supposed to address. (0294, 1-01)

Response: *The Project Team agrees that the selected Locally Preferred Alternative will not solve the congestion problems of the region; however, transit service in the Dulles corridor would provide an alternative to the automobile, while also increasing the overall transit capacity of the corridor and region.*

Diversity of Potential Benefits

Public Comment: It appears that many of the comments were from people who stand to benefit directly from building a rail system or developing along the rail line. There appeared to be very few comments from people who were actually interested in using transit.(0294, 1-02)

Response: *Comments on the Final EIS and Public Hearings Report were received from a variety of stakeholders representing the views of commuters, local residents, business owners, property owners, and local, state, and federal agencies.*

Need for Facilities to Adequately Support Anticipated Demand

Public Comment: I do have 2 major concerns: 1. Parking and Access: Will I have to pay to use the Dulles Toll Road to get to the new Dulles Metro stop? Will there be enough parking? Lots of folk who would normally use Vienna, like me, would turn to the Dulles stop. The WMATA should have a good idea of what the rider numbers are and how they "normally" change over time before plans are laid and carried out. (0108, 0108-E –2)

Response: *All stations will be accessible from the local street network so riders will not have to use the Dulles Toll Road to access stations. Parking at each station was designed and sized based on projected demand for spaces, site constraints, cost, and local land use plans. Consultation with local government was also an integral part of the sizing of parking facilities. The parking capacity identified in the Final EIS (see Table 6.3-3, page 6-39) and supporting documents such as General Plans – Facilities reflect this analysis and design process.*

B. Supplemental Draft EIS Comments

Local Agency Comments

Relationships to Other Planning and Transportation Initiatives

Local Comment: While we understand the Dulles Corridor Rapid Transit System is much further ahead of the Beltway Corridor rapid transit system, there is still a need and necessity to consider to the fullest extent possible how and where a Beltway Corridor rapid transit system will interface with the Dulles Corridor Rapid Transit System. Further, is it our understanding that the Commonwealth of Virginia recently examined potential Beltway Corridors and has additional information that may prove useful in the Dulles Corridor analysis that we are requesting. It is very unlikely that another public opportunity for planning system integration will occur in the Tysons Corner area.

What we are seeking is a graphical depiction of the general connection of the Beltway Corridor to the Dulles Corridor Rapid Transit System, so that in future years the figure in the Final EIS is a reminder and starting point for the facilities planning of that transfer facility. (0079, 1-01)

Response: *Montgomery County has clarified its request that the Dulles Corridor Rapid Transit Project recognize to the extent possible the interface between the Project and a future Beltway rapid transit system. In response, the Project Team has inserted a figure on page 1-15 of the Final EIS to serve as a reminder and starting point for future planning.*

Public Comments

Public Comment: The project team completely ignored the fact that the COG Board approved Version 6.3 in February '03, well in advance of the beginning of the SDEIS on LPA 1. (See attached again). The statement in the hearing report that Version 6.3 was not available until October '03 is false. Is the project team trying to avoid using 6.3 because the Loudoun Comp plan has fewer households that would feed into the rail system than the pre-2001 plan? Lastly, are you now saying that you are NOT going to use the official COG Version 2 travel demand forecasting model in the final EIS, as stated on page 94 of the SDEIS hearing report, despite the statement in the supplemental hearing report on the EIS: "If relevant, Version 2 may be utilized during the final EIS." Are you now saying Version 2 has no relevance to Dulles Rail? (0016, 1-01)

Response: *As described in the Supplemental Draft EIS Public Hearings Report (February 2004) the Round 6.3 land use projections were officially adopted by the MWCOG Board on October 8, 2003 and were not available for the Supplemental Draft EIS. More importantly, the purpose of the Supplemental Draft EIS is to provide additional opportunities for the public and agencies to comment on refinements that have been made to the LPA since the publication of the Draft EIS public hearings report. As such, the analysis documented in the Supplemental Draft EIS must use assumptions that are consistent with those used in the Draft EIS, as per CEQ regulations for implementing NEPA, parts 1500-1508. The Round 6.3 land use forecasts have been used in the analyses of the Final EIS.*

2.0 Alternatives Considered

A. Draft EIS Comments

Federal Agency Comments

Need for Implementation of the Full Metrorail Alternative

Federal Comment: BRT stations and stops should be designed as if they were rail stations. (0492 02)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS. As described in Chapter 2 of the Draft EIS, BRT stations would have been similar to Metrorail stations. BRT stops would have had Metrorail like amenities, such as a fare pavilion with ticket vending machines and faregate arrays. Stops may also have included bus bays for feeder buses, a Kiss & Ride area for short-term parking, and commuter park-and-ride spaces.*

Federal Comment: For portions of the project in the freeway medians, air rights above the freeway right-of-way should be transferred and developed so that walkable uses can be placed within ¼ and ½ mile from the stations. (0492 03)

> ***Response***: *As stated in Chapter 5 of the Final EIS, the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. DRPT will work with the local governments to support access to transit stations for pedestrians and cyclists and to implement transit-oriented development initiatives, although implementation of this form of development on private land is under the jurisdiction of the local government's in the area.*
>
> *With respect to air rights development above Metrorail stations, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators.*
>
> *Pedestrian walkways are provided from stations in the median of the highways to both roadsides.*

State Agency Comments

Recognition of Programmed Study Area Highway Projects

State Comment: Pg. 2-13 - The adopted FY-01 TIP/CLRP specifically identifies the following projects in the Route 28 Corridor between I-66 and VA 7:

- Partial interchange at Barnsfield Road, open to traffic in 2003
- VA 606 Interchange, open to traffic in 2005
- VA 625 Interchange, open to traffic in 2005
- VA 606 Interchange, open to traffic in 2005
- Westfields Road Interchange, open to traffic in 2006
- McLearen Road Interchange, open to traffic in 2006
- Innovation Avenue Interchange, open to traffic in 2006
- Study widening to 8 lanes and upgrading to a freeway between I-66 and the Dulles Toll Road, study to be
- completed by 2020
- Study upgrading to a freeway between the Dulles Toll Road and VA 7, study to be completed by 2020

- The draft FY-03 TIP/CLRP specifically identifies the following projects in the Route 28 Corridor between I-66 and VA7:
- Partial interchange at Barnsfield Road, open to traffic in 2003
- VA 606 Interchange, open to traffic in 2007
- VA 625 Interchange, open to traffic in 2005
- Upgrade VA 28 to a freeway (construct/interchanges/eliminate at-grade access points) and widen to eight lanes between I-66 and VA 7, open to traffic in 2015. Interchanges and widening could occur in the 2006 to 2015 time frame with all improvements open to traffic by 2015. (0421, 0421-A –15)

Response: *For the analyses in support of the Final EIS, the information provided by the commenter has been used to identify the significant roadways.*

Need to Reference Planning and Programming Documents

State Comment: Planned Roadway Improvements - It is suggested that, when discussing Planned Roadway Improvements, the DCRTP DEIS report make specific reference to their source official document(s): the Six Year Program, the Transportation Improvement Program (TIP) and the Constrained Long Range Plan (CLRP), and the Fairfax County Comprehensive Plan. Please refrain from using statements about "VDOT's decisions" that are not backed up by the approved Six Year Program or referred to in official correspondence. For projects beyond the Six Year Program time horizon, reference should be made to the source document: TIP, CLRP as appropriate (noting that these documents are the result of cooperative efforts of multiple agencies at various levels -- federal, state, local - - and subject to public review), and/or the Fairfax County Comprehensive Plan. Example planned improvements that need source clarification. (0421, 0421-A –17)

Response: *As suggested, all discussion of transportation programs and projects, including those of VDOT, has been appropriately referenced in the Final EIS.*

Need for Rail Improvements to Meet Existing and Future Demand

State Comment: Rail also responds to the phenomenal growth expected in this corridor; 56 percent in population and 71 percent in employment by 2025. With a capacity to carry 50 to 60,000 passengers maximum per hour, rail can in the future not simply meet the needs of today, but it can meet the needs of tomorrow. Rail will help us meet the needs of a rapidly expanding Dulles Airport, where passenger trips forecast for 2010 have been increased from 30 million to 37 million. Rail will help meet the demands of the National Air and Space Museum, which is expected to generate 3 to 5 million visits per year. (0131, 0163-T –7)

State Comment: I will highlight just a couple of the major reasons why I say we should move forward with rail now. First and foremost is the tremendous impact on the quality of life that rail transit will have for residents and employees in the corridor. People will be able to choose to take high quality, efficient rail transit service long envisioned for the corridor. Rail transit will enhance mobility and access to jobs and to cultural and educational facilities throughout the region. By providing a high capacity alternative to the single-occupant vehicle, we can use incentives in transportation measures to reduce vehicle miles of travel and improve air and water quality, a particularly important objective now. (0131, 0131-T –3)

State Comment: The Dulles Corridor Rail Association recommends the rail option now. It responds to our needs today, but most importantly, it provides a key element for a quality future for our communities in the corridor. Rail enhances our mobility in the corridor and eases access to jobs, but it also, and I think importantly, opens the region to a myriad of cultural and educational programs that are available throughout the area. (0131, 0163-T –6)

State Comment: I come to you tonight as an elected official saying that from my studies and my conclusions, looking at the alternatives proposed, I recommend that we choose as the Locally Preferred Alternative the rail option. (0131, 0239-T –2)

State Comment: And finally, as Mr. Klinge had mentioned, I chair a group called the Dulles Corridor Rail Association, and likewise our analysis says that we should go to the rail option. (0131,0239-T –4)

State Comment: The organizations I have just listed [Dulles Rail Now coalition] have studied the alternatives analyzed in the draft environmental impact statement of the Dulles Corridor Rapid Transit Project, and recommend that the Commonwealth of Virginia select as the Locally Preferred Alternative the rail option that produces the most ridership and has the most flexibility for increasing ridership in the future. While the organizations in the coalition will testify at the hearings on issues of particular concern to our individual organizations, we are united in our support of bringing rail transit to the corridor of the region that is second only to the District of Columbia in terms of employment, and contains several major activity centers. (0131,0239-T –5)

State Comment: Then in my capacity as chairman of the Dulles Corridor Rail Association, as I indicated, we are a membership organization made up of business and community leaders. We likewise have looked at the alternatives proposed in the project study. We unequivocally support the rail option now. (0131,0239-T –6)

State Comment: The organizations I have just listed issued a statement yesterday saying that having studied the alternatives analyzed in the draft environmental impact statement of the Dulles Corridor Rapid Transit Project, recommends that the Commonwealth of Virginia select as the Locally Preferred Alternative the rail option that produces the most ridership and has the most flexibility for increasing ridership in the future. (0131, 0163-T –1)

State Comment: Having studied the alternatives analyzed in the study, I strongly support Metrorail to Dulles Airport and Loudoun County as the locally preferred alternative. This alternative will provide both the highest transit ridership and the highest number of new riders, resulting in a higher percentage of people using transit. More commuters will benefit from shorter travel times than other alternatives. The best option is to build rail the full length of the project from the beginning. Most people living in my Senate district, which extends from McLean to the Loudoun County border, clearly prefer this alternative. They view rail as an attractive way to commute. They also want to have the entire system at the earliest possible date. (0298, 0298-L –1)

State Comment: Likewise, as an organizer with others of the Dulles Rail Coalition Now, I want to bring to you a statement brought forth by a number of organizations supporting again the rail option. (0131,0239-T –3)

State Comment: But for the decision before us tonight, that decision being the Locally Preferred Alternative, the Dulles Corridor Rail recommends that we move to rail now. (0131, 0163-T –10)

State Comment: We having studied the alternatives analyzed in the draft environmental impact statement of the Dulles Corridor Rapid Transit Project, recommend that the Commonwealth of Virginia select as a Locally Preferred Alternative the rail option that produces the most ridership and has the most flexibility for increasing ridership in the future. To optimize ridership, continuing planning efforts should focus on improving station access and transit-oriented development around the stations. While we are testifying at the hearings on issues of particular concern to our individual organizations, we are united in our support of bringing rail transit to a corridor of the region that is second only to the District of Columbia in terms of employment and contains several major activity centers. Rail would serve Tysons Corner and is able to accommodate the projected growth in corridor transit trips. The coalition supports rail now. We will work with the region's elected leadership to bring rail to the Dulles corridor by 2010, sooner if feasible. (0131, 0131-T –1)

State Comment: While we may, speaking of the organizations that I have listed, testify at the hearings on issues of particular concern to our individual organizations, we are united in our support of bringing rail transit to a corridor of the region that is second only to the District of Columbia in terms of employment and contains several major activity centers. (0131, 0163-T –2)

State Comment: Like the vast majority of residents and businesses in my district, I enthusiastically embrace the prospect of Rail Now to Dulles. And I look forward to assuring that it is done right. (0298, 0298-L –9)

State Comment: While these are troubling times for the national and Virginia economies, the project's feasibility may be increased. Competition for labor and materials is likely to work to reduce the cost of construction. Interest rates are low. This is the time to accelerate construction of the project. We need to maintain the effort rail is fully extended to Route 772 in Loudoun County. (0131, 0434-E –7)

State Comment: Now turning to my role a chair of the Dulles Corridor Rail Association, DCRA has been advocates for rail since we were organized four years in August of 1998. The analyses that have been done as part of the work preparing the Draft EIS and the facts that emerged about the alternatives under study support our goal of seeing rail adopted as the Locally Preferred Alternative. We urge the Commonwealth to reach agreement with the Dulles transit partners, the private sector team, to engineer and complete construction of the entire rail system as quickly as possible. (0131, 0131-T –2)

> ***Response:*** *Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative.*

State Comment: The Virginia Department of [Environmental Quality] is of the opinion that any of the "build" alternatives described in the Draft EIS would be preferable to the no-action alternative because of the beneficial impact of improved mass transit on congested areas in Northern Virginia, including Tysons Corner. (0407, 0407-A –18)

> ***Response****: Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative.*
> *The Virginia Department of Environmental Quality's participation in the public hearings, agency coordination process and opinion as to which alternatives would best serve the needs of the Dulles Corridor and region were incorporated into that decision-making.*

Need for Sensitivity in Station Design

State Comment: Special sensitivity is needed in the design of the Reston stations to encourage bridging the Corridor, which currently severs the community. The design of rail stations should further the goal of linking the opposite sides of the corridor. The station designs should not preclude the possibility of air right linkages across the Dulles Corridor. (0298, 0298-L –6)

> ***Response:*** *With respect to air rights development above Metrorail stations, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators.*
>
> *Pedestrian walkways are provided from stations in the median of the highways to both roadsides.*

Need for Consistency with Fairfax County Trail Plan

State Comment: Ease of access by pedestrians, buses and bicyclists, including conformance with Fairfax County's County-wide Trail Plan, will be important measures of the success of our planning and implementation of this critical link in our transportation network. (0012, 0468-L –3)

State Comment: We also suggest that with the adoption of rail as the Locally Preferred Alternative that the counties move forward with the station access planning to ensure that the station area development provides an enhanced bicycle and pedestrian access facility as well as feeder bus services. (0131, 0131-T –9)

State Comment: Similarly, we request that future engineering work ensure optimum station access by pedestrians, bicyclists, and feeder buses. This has been an issue of particular concern at the Reston Parkway and Wiehle Avenue stations in Reston, at Route 772 and at the central stations is Tysons Corner. Now that the property owners group is coalescing as LEADER (the Landowners Economic Alliance for the Dulles Extension of Rail), there is even more reason to work closely with property owners adjacent to the rail stations and track alignment. They are in a position to help fund some of the station access enhancements. (0131, 0434-E –3)

> ***Response****: DRPT is the Project's sponsor and initial owner. However, the responsibility for modifications of sidewalks and trails as part of station access is with Fairfax County, Loudoun County, Town of Herndon, City of Falls Church and VDOT. DRPT will, though, coordinate with these jurisdictions and agencies during preliminary engineering and final design to determine the improvements for station access beyond the station site plans, as well as their ownership and maintenance. Close communication would also occur with the Fairfax County Non-Motorized Transportation Committee, private landowners and developers and other stakeholders. The Fairfax Countywide Trails Plan and the Loudoun County Trails plan have been and will be consulted. Comprehensive pedestrian circulation beyond the station site plans may be implemented in conjunction with other planned developments, County, and/or State projects and/or as elements of the Fairfax Countywide Trails Plan and the Loudoun County Trails plan.*

Need for Adequate Access and Parking at Stations

State Comment: To avoid disruption of communities and to encourage rail usage, adequate structured parking as well as pedestrian and bicycle access are required system-wide. (0298, 0298-L –7)

> ***Response:*** *Chapters 2 and 6 of the Final EIS identify the existing and proposed park-and-ride and Kiss & Ride facilities that would allow for automobile access to the stations of the Metrorail Extension.*
>
> *The Facilities General Plans (Final EIS Volume V) identify structured park-and-ride facilities and pedestrian access provisions within the station site plans. Designs will be developed in more detail during preliminary engineering and final design.*

Regional Agency Comments

Need to Reduce Operating Times

Regional Comment: Independent market research reports that Dulles Corridor ridership is very sensitive to journey time and service standards. Rail and Bus Rapid Transit (BRT) options proposed in the DEIS offer trip times that in most instances are similar to or longer than the single occupancy vehicle traveling under the super congested conditions of 2025. This is unacceptable. It would depress ridership and undermine the return on the taxpayer's investment. As part of the remedy for this serious deficiency, a Corridor-to-Core express track should be built in the corridor median between Route 123 and Route 7, in addition to the four-station Tysons Corner detour proposed in options T6 and T9. Trains using the express track would cut 17 minutes or more from the journey time between stations in the Corridor and those in the region's inner core, without undermining the attractiveness of service to Tysons Corner. The precise ratio of express trains should be determined by market demand. The express track would optimize rail's appeal for:
a) Riders from the Dulles Corridor and Dulles Airport to inner core destinations;
b) Riders from the inner Core to Corridor destinations west of Tysons Corner including Dulles Airport.

Construction cost of the Tysons Corner express track should be minimal as the right-of-way exists and no additional stations, elevated sections, etc. would be needed. At the very least, the option to create a Tysons Corner express track should be maintained as part of the Commonwealth's preferred local alternative. Table 1 demonstrates the significant timesavings offered by an express train bypassing Tysons Corner in comparison to DEIS projections for T6, T9 and the baseline. Figure 1 illustrates the alignment of the express track. Requested Action: Include an express track in the Corridor between Route 123 and Route 7 as part of the locally preferred alternative. (0133, 0405-L –4)

> ***Response****: The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignments T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*
>
> *In response to the above requests, the Project Team evaluated the suggested alternative using the same social, environmental, economic, and transportation factors used for the evaluation of alternatives documented in the Final Alternatives Analysis Report (May 2001). This new alternative, called Alignment T12, was not recommended for further consideration in the Dulles Corridor Rapid Transit Project. Alignment T12 would have numerous deficiencies relative to the alternatives previously considered in the Draft EIS. These deficiencies include increased costs, substantial impacts associated with shifting roadways to accommodate the alignment, reduced ridership, and operational complications.*
>
> *The full evaluation for Alignment T12 is documented in a technical memorandum, now part of the Final Alternatives Analysis Report Addendum).*

Concern for Appropriate Aesthetic Integration

Regional Comment: The rail system should blend with its surroundings. The elevated concept, suggested in the draft EIS, we think underlines the need for a talented designer. (0133, 0133-T –4)

Regional Comment: The rail system should blend with its surroundings. The elevated designs suggested in the DEIS underline the need for a talented designer. (0133, 0221-M –3)

Regional Comment: Architectural standards and landscaping: A talented designer should be engaged to ensure that stations and any elevated structure blend with their surroundings and that the corridor remains attractively landscaped. Good design need cost no more than bad, and indeed costs significantly less if the attractive proposals win citizen support instead of opposition. (0133, 0405- L- 6)

> ***Response:*** *The design of the elevated guideway as well as stations and landscaping will be refined during preliminary engineering and final design. Dulles Corridor station architecture may incorporate WMATA's "New Look" design that has been part of the New York Avenue, Morgan Boulevard and Largo Town Center Stations, all opening in late 2004. This concept retains key principles of Harry Weese's original design, with more inviting and better-defined entrances, an emphasis on customer information, and an open, graceful, and light feel through the use materials such as steel and glass for enclosures.*

Need for Integration of Adequate Pedestrian Access

Regional Comment: The Airports Authority intends on preserving the right-of-way for future underground pedestrian connections to the Terminal from the vehicle parking north of the Terminal to remove pedestrian-vehicle conflicts and increase capacity of the commercial vehicle road. This pedestrian connection would be similar to the pedestrian connection that this project proposes to use for rail passengers to gain access to the Terminal. The current plans do not provide sufficient detail but it appears that the east portion of the Dulles Station and the #10 double crossover do not allow sufficient clearance between existing grade and the top of the station structure for the pedestrian connection to cross over the top of the station. (0440, 0440-A –13)

Response: *The future underground connection cited in this comment is assumed to pass through the train room, not above the station structure. This future underground pedestrian connection could be constructed as a separate walkway, and/or as a second entrance to the station. DRPT and WMATA will continue to coordinate with MWAA as the design of the Dulles Airport Station is refined during preliminary engineering and final design.*

Need for Adequate Parking Facilities

Regional Comment: Also as we see a majority of this rail extension serving commuters, we have some concern whether adequate parking is being planned for in this project. The Airports Authority is prepared to make reasonable accommodations for commuters and commuter parking on airport property in the form of the BRT maintenance facility, the Dulles North Transit Center, and future parking accommodations at the Route 606 Station. We are willing to consider sitting the rail inspection and maintenance facility on Airport property provided there are no other reasonable and prudent alternatives. However, these regional commuter accommodations proposed on Dulles property represent the upper limit of what the Airports Authority may be willing to accept. To help realize the full potential of this rail extension, accommodations for additional parking beyond what is proposed in the draft EIS should be further considered. (0440, 0440-A –3)

Regional Comment: The rail stations should be integrated with land use in order to increasing ridership and reduce the subsidy burden on the region's taxpayers. The lack of parking at Rt. 772 and the location of parking at Rt. 606 are examples of the many refinements required in the design phase. (0133, 0221-M –4)

Response*: As stated in Chapter 5 of the Final EIS, the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, and walkable, bike-friendly development patterns in close proximity to the transit stations. Parking at each station/stop was designed and sized based on projected demand for spaces, site constraints, cost, and local land use plans. Consultation with local government was also an integral part of the sizing of parking facilities. As evaluated in the SDEIS as a revision to the selected LPA and further documented in the Final EIS and final General Plans, the Project Team reconfigured the park-and-ride program in Loudoun County. Route 772 Station increased from no park-and-ride facility to two structures of 3,300 spaces combined. Route 606 Station decreased from 4,750 spaces to 2,750 spaces.*

Local Agency Comments

Concern for Potential of Pedestrian/Auto Interactions

Local Comment: Impacts - It is troubling that little consideration was given to pedestrian improvements as a significant number of young people traverse this area due to the proximity of schools. We see pedestrian and vehicular conflicts increasing as enrollments and car trips increase in this small geographic area. There are no plans for widening either US 29 or VA Route 7 within the City [of Falls Church] and the City's Adopted Comprehensive Plan and Streetscape Plan do not recommend any future street widening in the City. As a result, the existing streets will have to accommodate any increased vehicular traffic. (0122, 0122-A –22)

Response: *It is not within the scope of the Dulles Corridor Rapid Transit Project to mitigate existing traffic/roadway capacity problems on Route 7 and Route 29 within the City of Falls Church.*

Implementation of the Project would result in increased off-peak service frequencies for eastbound trains at the East Falls Church Station. However, operating plans for the Wiehle Avenue Extension and Full LPA assume no additional feeder bus service, nor any new parking for the off-peak period for this station. Because the station's existing park-and-ride facilities are

typically full by 8:00 AM on most weekdays and parking is controlled on local streets, it is not anticipated that increased off-peak Metrorail frequencies would generate additional traffic in and around the East Falls Church Metrorail Station. While the Project Team does anticipate other effects, as there would be no change from existing conditions, meetings with the City of Falls Church were held to discuss the issues of overflow parking and cut-through traffic due to the selected LPA, the Metrorail Extension.

The demand forecasting model used in the Final EIS utilizes an approach called a nested logit model. This model approach is a detailed method for first taking all person trips and distributing them between different modes (e.g. automobile, transit, other mode). The total person trips are modeled based on the number and density of residences in a geographic area called a Transportation Analysis Zone (TAZ). For transit trips the model then distributes trips between different modes of arrival (e.g. walk, auto, feeder bus). In assigning trips to a specific mode of arrival, the model considers total trip time, including time required to access the station by each mode, whether a walk access path exists, available parking, and available feeder bus service. This model is quite detailed and can be further fine-tuned by splitting the geographic analysis zones that are the foundation of the modeling process to more accurately reflect where people live and work within a densely developed area such as Tysons Corner.

Public Comments

Successful Operating Parameters of the Preferred Alternative

Public Comment: The Dulles Corridor has the potential to become one of, if not the most heavily used section of the region's Metro rail system. The potential is conditioned upon:

a) Effective service from the entire Corridor to Tysons Corner;
b) Optimization of the transit system with land use, including the future evolution of mixed use air rights developments above stations where such developments would enhance county objectives and where they would be compatible with neighborhood desires;
c) Careful integration of stations with their surrounding land uses such that the maximum number of people are attracted to transit from the automobile;
d) Journey times for the commuter, which over the longer distances at least, are comparable or superior to automobile travel during the peak hour times projected for 2025 and beyond;
e) A service oriented system that meets the requirements of the sophisticated, well-educated denizens of the Dulles Corridor.
f.) A system that is operated as a transportation system designed to attract ridership rather than as a heavily subsidized social service - the normal attitude toward transit.

Requested Action: Provide flexibility in the locally preferred alternative to enable the design team to meet these objectives. (0133, 0405-L –3)

Response: *Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and have been considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner and with Yard Site Y15 on Airport property as the Locally Preferred Alternative. The LPA will be constructed in two phases, the first being the Wiehle Avenue Extension.*

Public Comment: The rail stations should be integrated with land use in order to increasing ridership and reduce the subsidy burden on the region's taxpayers. The lack of parking at Rt. 772 and the location of parking at Rt. 606 are examples of the many refinements required in the design phase. (0133, 0221-M –4)

Response: *As stated in Chapter 5 of the Final EIS the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, and walkable, bike-friendly development patterns in close proximity to the transit stations. The Project Team will work with the local government to integrate transportation with land use. As evaluated in the SDEIS as a revision to the selected LPA and further documented in the Final EIS and final General Plans, the Project Team reconfigured the park-and-ride program in Loudoun County. Route 772 Station increased from no park-and-ride facility to two structures of 3,300 spaces combined. Route 606 Station decreased from 4,750 spaces to 2,750 spaces.*

Need for Improved Transit Access to Airport

Public Comment: Today there are four lanes in the Dulles Corridor dedicated to airport access, and two further lanes, for a total of six can be added. An earlier airport access study prepared for the task force showed that reasonable levels of service on the Dulles airport access road in 2010, without rail, would require eight lanes between Route 28 and the capital beltway. (0132, 0132-T –2)

Public Comment: Today there are four lanes in the Dulles corridor dedicated to airport access, and two further lanes for a total of six can be added. An earlier airport access study prepared for the Task Force showed that Reasonable levels of service on the Dulles Airport Access Road in 2010 without rail would require 8 lanes between Route 28 and the Capital Beltway. Rail between the region's designated international airport and the National Capital is long overdue. Dulles Airport is expected to increase passenger trips from 20 million in 2000 to 37 million by 2010 and expects to double the number of employees from 15,000 to 30,000. The Dulles Center of the National Air and Space Museum projects 3 to 5 million visitors per year when it opens in December 2003. (0132, 0222-M –1)

Response: *As shown in Chapter 6 in the Final EIS, the Dulles International Airport Access Highway currently operates at Level of Service (LOS) C during the peak period. This level of service represents moderately congested conditions and relatively free-flow travel speeds. By 2025, the DIAAH is expected to operate at LOS D without the Full LPA and at LOS C with the Full LPA. A level of service at D represents more congested conditions, but speeds are only reduced moderately, and, in practice, it is widely considered an acceptable level of service.*

Suggested Alignment Modification

Public Comment: The WATF recommends that the rail option offering the greatest potential ridership should be selected by the Commonwealth Transportation Board as the locally preferred alternative. (0133, 0405-L –1)

Response*: Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner and with Yard Site Y15 on Airport property as the Locally Preferred Alternative. The LPA will be constructed in two phases, the first being the Wiehle Avenue Extension.*

Need for Bus Service Improvements

Public Comment: Reiterates his support for the proposed Metrorail project, and supports some form of bus service, preferably express bus service, prior to the arrival of Metrorail. (0096, 2-01)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner and with Yard Site Y15 on Airport property as the Locally Preferred Alternative (LPA). The LPA will be constructed in two phases, the first being the Wiehle Avenue Extension.*

For the Wiehle Avenue Extension, corridor express bus service, formerly referred to as 'premium bus', will be a feeder system for the interim end-of-line Wiehle Avenue Station. It will be a high quality service meant to replicate rail service to the greatest degree possible until rail is extended to Loudoun County in the second phase of the project. The service would mimic rail in terms of service to station areas served by rail (Route 772, Route 606, Dulles Airport, Herndon-Monroe, Reston Town Center, and Wiehle Avenue) service frequency, hours of service, and the fact that there would be high quality service in the reverse peak direction. The Corridor express bus service will not replace express service currently run by Loudoun County into Rosslyn and downtown Washington.

B. Supplemental Draft EIS Comments

No comments pertaining to this topic were received

2.1 Alternatives Previously Considered

A. Draft EIS Comments

Public Comments

Need to Adequately Consider Lower Cost Alternatives

Public Comment: As a part of the necessary re-examination, alternatives that were given short shrift in the original planning need to be looked at again. In particular, a light rail system running from Tysons Corner to Dulles Airport and Loudoun County should be considered. Metro from Falls Church to Tysons, fine-- but then light rail to Dulles. Whatever the technical reasons for choosing heavy rail Metro, the sheer cost of a Metro extension tells us that we have no choice but to look a new at less expensive alternatives. Light rail costs about $25-40 million per mile including rail cars. Metro costs projected for this project are about $140 million per mile without rail cars. (0151, 0297-E –5)

Public Comment: Alternatives that were given short shrift in the original planning needs to be looked at again. In particular, a light rail system running from Tysons Corner to Dulles airport and Loudoun County should be considered. Metro from Falls Church to Tysons, fine, but then light rail to Dulles. Whatever the technical reasons for choosing heavy rail metro, the sheer cost of a metro extension tells us that we have no choice but to look anew at less expensive alternatives. Light rail costs about $25-40 million per mile, including rail cars. Metro costs projected for this project are about $140 million per mile, without rail cars. Beyond that proposal, we have a series of questions that reflect our concern. (0151, 0151-T –4)

***Response:** A number of other modes were considered for the project, including light rail. Light rail was studied as part of the Dulles Corridor Transportation Study (June 1997), a major investment study, and was requested again during the Scoping Process for the preparation of the Draft EIS. As part of the Draft EIS process, the Project Team reconsidered light rail. The Project Team reviewed the findings of the analysis performed during the Major Investment Study and found the analysis to be valid. Therefore, light rail was eliminated from further consideration and was not fully analyzed in the Draft EIS. The reasons for the elimination of this alternative are fully detailed in the Final Alternatives Analysis Report (May 2001), and are summarized below.*

Light rail is often proposed as an alternative to heavy rail as a lower cost solution, because it can operate in existing roadway rights-of-way, and does not require a fully-grade separated alignment. However, in the Dulles Corridor, light rail would have followed the same alignment as the Metrorail Alternative. Different alignments for light rail, including off-median alignments that directly served town centers in the corridor, were considered during the MIS, but were determined to be less cost effective than a median alignment. In locations where the Metrorail Alternative diverges from the median and is grade-separated, light rail would also have had to be grade-separated. In Tysons Corner, light rail would have had to be elevated or underground to avoid existing traffic; and at Dulles Airport, light rail would have needed to be underground to avoid

visual impacts to the historic airport terminal. For the remainder of the alignment, both light rail and Metrorail would operate at grade; therefore, light rail would not have likely offered a substantial cost savings over Metrorail.

The Metrorail Extension capital costs average $150 million per mile, including all vehicles, right-of-way, roadway work, and escalation to year of expenditure. The costs for a light rail system will vary depending on alignment, grade separation, station configuration, and environmental constraints. Though some light rail systems have cost approximately $25 to 40 million per mile to build; other systems have cost much more. As noted in the technical memorandum for light rail in the Final Alternatives Analysis Report (May 2001), the first mile of the Newark-Elizabeth Rail Link in downtown Newark, New Jersey cost $141 million per mile.

Use of light rail would have forced a transfer at the Orange Line for passengers traveling between the corridor and the region's core, reducing ridership on the Dulles Corridor line. As noted in the comment, this transfer would have been a high-quality transfer, similar to the transfer between two Metrorail lines; however, because transfers introduce additional wait time and travelers are generally resistant to changing vehicles once they have started a trip, transfers typically incur an additional penalty in models. The more time that a traveler would have to spend waiting for a transit vehicle or changing between transit vehicles, the less attractive transit becomes. The ridership estimated in the MIS demonstrated the effect of this transfer would reduce ridership on the line by approximately 20 percent. Overall, the combination of reduced ridership and similar capital costs would have resulted in lower cost effectiveness for a light rail alternative than for the Metrorail Alternative.

Because light rail and Metrorail would have the same degree of grade separation, light rail would not have been less intrusive than Metrorail. In fact, elevated light rail would have been visually more intrusive than Metrorail. Because a light rail alternative would have been powered by overhead catenary wires, the visual profile of an elevated light rail alternative would have been higher than that for Metrorail. In addition to the elevated structure, the light rail alternative would have included catenary poles and wires extending another 22 feet above the top of the structure. As a result, in the Tysons Corner area, an elevated light rail system would have had greater impacts on area aesthetics.

Consideration of Monorail Technology

Public Comment: The Dulles Corridor transportation study, dated in June 1967 -- 1997, excuse me, mentioned emerging technologies, one of which was monorail. It concluded that monorail had not yet been established as a proven technology in an urban transportation role, and that the Dulles Corridor did not appear to be an appropriate place for such a test case. It concluded that monorails are found in airports and theme parks and that they did not have sufficient capacity to provide long distance, high volume service, which clearly the Dulles Corridor area required. (0266, 0266-T –1)

Public Comment: The situation has changed in the past five years, with respect to monorail. The current assessment for the Dulles Corridor concludes that metro, heavy rail, is estimated to cost over $3 billion, with an annual operating cost of about 100 million. Frequent mention has been made that funding sources of this magnitude are in question, if not in doubt. We therefore have the opportunity to revisit the position taken in 1997 with respect to monorail, which today offers some real possibilities and capacity for the Dulles Corridor. (0266, 0266-T –2)

Public Comment: In reviewing the Dulles Corridor Transportation Study dated 1997 - June 1997 - I found that the reason given for not considering monorail for the Dulles Corridor was that these were options that were not established as proven technologies in a conventional urban area, and that we didn't want to use monorail as a test case in the Corridor. Also the reason of seamlessness was originally cited, although I've read it in the report, but it's not in the one that's published. I don't know why the difference, but it doesn't provide seamless. One must change modes at West falls Church. (0266, 0283-T –1)

Public Comment: Monorail offers the possibility of reducing the Dulles transit costs by two-thirds or more. (0266, 0266-T –3)

Public Comment: "Monorail or similar system - Before proceeding further with the EIS process, DRPT should re-evaluate the outdated 1997 Major Investment Study (MIS) regarding the feasibility of using monorail for the Dulles Corridor project, taking into consideration the lower costs of construction and operation, the ability to better serve the "downtown" areas of Tysons Corner, Reston, Herndon and Dulles Corner, and the requirement for less right-of-way. Rationale: While monorail was rejected in the 1997 MIS because it was considered an "emerging technology," today, five years later, there are 41 such systems in operation around the world. Seattle, Washington is proposing to add three additional monorail lines. The costs of construction and operation of monorail is much less than heavy rail as shown in comparing costs between the Draft EIS and cost data available from monorail companies. An aerial monorail/monobeam system is more flexible and can be routed through "activity centers" to serve the entire areas instead of only the core or only the periphery. Finally, a monorail-type system is less invasive aesthetically and more environmentally friendly. (0402, 0402-L –8)

Public Comment: Monorail offers the possibility of reducing the Dulles transit cost by 2/3 or more and avoiding the requirement for an annual subsidy - assuming adequate ridership demand. (0266, 0390-M –1)

> ***Response:*** The *comments are correct in stating that the reason that monorail was eliminated during the 1997 MIS process was because (1) it was not a proven technology in an urban setting, (2) the Dulles Corridor was not deemed an appropriate test case for the technology, and (3) the technology typically had insufficient capacity for long-distance, high-volume lines.*
>
> *During the early stages of the Draft EIS process, a number of other modes were considered for the Dulles Corridor Rapid Transit Project, including monorail. The MIS reasons for dismissing monorail were re-evaluated to determine if they were still valid. Overall, it was found that these reasons are valid. Though monorail technology is capable of supporting high-speed, high-capacity service, few such systems are in operation over long distances. It was decided that the Dulles Corridor was not an appropriate test corridor for a long distance application. These and additional reasons for eliminating monorail from further consideration have been explained fully in the Final Alternatives Analysis Report (May 2001).*

Comparison of Alternatives

Public Comment: Disappointed that you did consider only heavy rail, and not monobeam/monorail which is less costly and less environmentally intrusive. (0069, 0069-CC-1)

Public Comment: I would like to quote from the Capital Beltway Rail Feasibility Study of February 2001, issued by the VA Department of Rail and Public Transportation. It evaluated a number of alternatives, including heavy rail, light rail and monorail. In referring to monorail, it said: This alternative could offer high ridership, lower cost, and the least environmental impacts of all the alternatives. In a similar alignment, the heavy rail alternative featured only seven stations, whereas light rail offered 17, monorail 19. A solitary Tysons heavy rail station would have the additional benefit of allowing for a shorter commute for through passengers; that is, those for whom Tysons Corner is not a destination. (0178, 0178-T –5)

Public Comment: But here both light rail and monorail were rejected even though VDOT's own data from the study of the lines from Springfield to Tysons Corner show that light rail and monorail were more cost-efficient than heavy rail. (0112, 0245-T –3) (0112, 0269-M –4)

Public Comment: It is essentially - the monorail is mounted on a single beam and you have transit cars move both ways on the same beam. That was - this particular type of system was addressed in the study that was done - directed by the Virginia General Assembly, under Mr. Corey Hill, and evaluated mono-beam monorail, light rail, heavy rail and bus between the Tyson's Metro system station in Springfield, via

the hospital, through Annandale, via Fairfax Hospital, Merrifield, and through into Tyson's Corner, then to American Legion Bridge. (0266, 0283-T –2)

Public Comment: It is requested that advanced monorail systems be evaluated for the Dulles Corridor in the same rigorous fashion that was done for the Capital Beltway Corridor Study, previously cited. It appears that some of the information already collected in existing studies (Beltway and Dulles Corridor studies) could be used for this analysis. This would likely be an unplanned extra effort. However, it would permit you to evaluate a monorail strategy and possibility of generating economic and demographic solutions beyond our current vision. It might introduce a new transportation mode in our area and create change in our human scene and betterment of the life of our citizens. (0266, 0390-M –3)

Public Comment: I would urge that because of the cost involved for the current Metro system to Dulles, that's currently envisioned in the EIS and the MIS studies, that mono-beam monorail be evaluated. I know it's late in the day, I know that a lot of work has been done, but we would be remiss by not doing those hard tasks that evaluate all the alternatives, as was done in a study directed by - as I said earlier, by the Virginia General Assembly. (0266, 0283-T –3)

Public Comment: According to the DEIS, the monorail alternative was eliminated from further consideration based on how well it served business and community transportation needs in the corridor, and how well it "fit" into the transportation, social, environmental and economic context. (S-22). The DEIS concluded there was no justification for including the monorail as a viable alternative without giving the public an opportunity to review the evidence or analysis. Again, the DEIS indicates a bias for Rail. By rejecting the monorail alternative and failing to provide the public with the analysis, the NEPA process has not been followed. Therefore, the monorail alternative should be analyzed and reported as a viable transit alternative. This information should have been included in the DEIS. (0147, 0459-L –6)

Public Comment: Monorail offers the possibility of reducing the Dulles transit costs by two-thirds or more. (0266, 0266-T –3)

> ***Response:*** *The commenters are correct in stating that the Capital Beltway Rail Feasibility Study (March 2001) found that light rail and monorail were more cost effective than Metrorail in the Capital Beltway corridor (in terms of cost per passenger mile and cost per new transit trip). The study also concluded that, in the Beltway corridor, suspended-monobeam monorail could offer high ridership, lower cost, and the least environmental impacts. However, the findings of this study are not directly applicable to the Dulles Corridor Rapid Transit Project, because the evaluation of a particular mode in a given corridor is dependent on a number of factors. Due to differences in the constraints and conditions in the corridors, the proposed alignments, and the number of stations for each mode, the findings of the Rail Feasibility Study do not necessarily have relevance for the Dulles Corridor Rapid Transit Project.*
>
> *Unlike in the Dulles Corridor, the alignments under consideration for each mode in the Rail Feasibility Study were different for each mode. For the Red corridor, a substantial portion of the Metrorail alignment was underground or aerial, while the light rail alignment was almost entirely at-grade. These differences heavily influenced the cost differences between these two modes. Moreover, as noted by one commenter, the light rail alignment had more than twice the number of stations of the Metrorail alignment. An alternative with this many more stations is almost certain to have more ridership.*
>
> *For the Dulles Corridor, light rail would follow the same alignment and have approximately the same number of stations as Metrorail (as documented in the Final Alternatives Analysis Report, May 2001). The alignment would have to be elevated (or underground) through the core of Tysons Corner to avoid traffic impacts, and it would have to be underground at Dulles Airport to avoid impacts to the historic airport terminal or views of the terminal. The majority of the alignment would be located at-grade. As a result, there would be little cost savings advantages for light rail. Moreover, use of light rail would force a transfer at the Orange Line for passengers traveling between the corridor and the region's core, reducing ridership on the Dulles Corridor*

line. Therefore, in the Dulles Corridor, the cost effectiveness of a light rail alternative would likely be similar to that for the Metrorail Alternative.

The suspended-monobeam monorail system evaluated in the Rail Feasibility Study is a prototype system that, at present, has only been operated as a quarter-scale model in Charleston, South Carolina. The manufacturer of the system, FUTREX, Inc., is currently in the process of selecting a location for the first full-scale implementation. It is anticipated that they will select the city in the next six months. According to their website, "It is anticipated that the first installation will require a three-to-four year effort at a cost that is dependent upon the location, system length, and complexity" (www.futrexinc.com/ OriginFuture.htm). The benefits, impacts, and costs of the operational system would not be fully understood until several years later. In the interim, there is no real-world operating experience to determine whether the suspended-monobeam system would definitely be able to function as proposed, particularly in a long, suburban corridor.

Moreover, the final costs to design, construct, and operate a suspended-monobeam system are in question at this time. The cost estimates for the conceptual monorail system studied in Rail Feasibility Study were based solely on the manufacturer's estimates of per mile costs. At that time, costs were $22.5 million per mile, including guideway, stations, power substations, vehicles, vehicle maintenance facility, and train control. Currently, the manufacturer's website indicates these costs would be $30-35 million per mile (conservatively). It is very possible that as the technology is developed further and put into full-scale operation, particularly for longer and more complex systems, cost estimates will escalate further (see subsequent monorail responses for examples of how costs for newer technologies can escalate dramatically as conceptual system designs are advanced into more detailed design and construction).

As noted in the Capital Beltway Rail Feasibility Study, though monorail technology appears to offer several transportation benefits, numerous issues would affect the decision to implement this technology in the Washington metropolitan region:

- *Trials indicate the FUTREX system can operate as proposed, but it has "no track record of revenue service to create confidence that the region should invest in excess of two billion dollars on this approach" (Rail Feasibility Study, Final Report, Page 7-5).*
- *Likewise, traditional monorail systems have no real-world operating experience in long-distance, suburban environments.*
- *In addition, traditional monorail systems would not likely have the same cost effectiveness as determined for the monobeam system because (1) they would have a larger footprint and higher costs, and (2) they would have slower speeds, resulting in lower ridership.*

Overall, monorail was recommended for further study in the Rail Feasibility Study because it showed promise and because it was recognized that "rail in [the Capital Beltway corridor] is still projected to occur no sooner than twenty years in the future" (Page 7-5).

Rapid transit improvements in the Dulles Corridor, however, are expected to be implemented in the near future. As noted in the Dulles Corridor Transportation Study (June 1997) and the Final Alternatives Analysis Report, it would not be desirable to test an unproven technology in the Dulles Corridor, particularly given its length and the level of investment required.

A suspended-monobeam or other monorail system would not necessarily be less visually intrusive than Metrorail in the Dulles Corridor. Although the guideway elements are smaller, the size of the stations would be determined by the length of train consists and the expected number of passengers passing through the station at peak times. Station platforms must be long enough to accommodate lengthy trains, and wide enough to accommodate waiting and circulating passengers. Stations must also accommodate vertical circulation elements such as escalators, stairs, and elevators. In areas such as Tysons Corner, stations are the most significant visual element of the selected Metrorail Extension. If monorail stations are sized to accommodate the

same level of demand as Metrorail, then the stations would not necessarily be much smaller than the proposed Metrorail stations.

The issue of the solitary Tysons Corner station allowing a shorter commute for travelers bypassing Tysons Corner was explored as part of analysis conducted in response to other comments. The analysis showed that a Metrorail alternative that travels along the median of the DIAAH between Wiehle Avenue and East Falls Church with a stop at the Spring Hill Road Station would save approximately 5 minutes over alignments that penetrate the core of Tysons Corner. Given that, for the Metrorail Alternative analyzed in the Final EIS, travel times for trips between Arlington and the central and western portions of the corridor would be approximately 30 to 50 minutes, a time savings of 5 minutes would be negligible. For while the perceived difference between a 5-minute trip and a 10-minute trip could be substantial, the perceived difference between a 25-minute trip and a 30-minute trip is relatively minor.

Consideration of Light Rail Technology

Public Comment: It is time to look at a method of travel that would be less invasive and much needed. I believe that light rail is the answer. This rail could connect our present metro system to the Tysons Corner area and the Dulles Corridor. Currently, when we ride Metro and we change lines, we are required to change trains. It should be possible to use some of the current metro stations as transfer points for these light rail cars. People from all over the metro area could travel from one area of the line to another with little or no interruption. (0098, 0098-E –2)

Public Comment: Why didn't you look at light rail when WMATA is looking at that for D.C. right now? (0112, 0382-L –25)

Public Comment: Yes, there is a solution, Light Rail directly to Dulles. A light rail was put in place in Pasadena, CA which is over eighteen miles and was built at a cost of only six hundred million dollars, which also included land acquisition cost. This system will carry twenty five percent more than what our system is projected to carry. This of course, is not a too heavy financial burden of which the state could pick up its share of the cost. The only criticism is that it is not seamless, but heck, the present metro is not seamless. I believe that over two to three billion dollar savings is not a bad deal, except for those who are planning on getting rich from building the present proposed rail system. (0189, 0201-L –5)

Public Comment: Light rail was not effectively analyzed. The system in Pasadena, California, which is over 18 miles long, can carry 25 percent more than the proposed Metro Rail, cost around $600 million to build should have been considered. Why not? The argument for seamless is moot since the present Metro system is not seamless. (0189, 0448-E –8)

Public Comment: Supports WMATA as the “operator of choice” for the regional light rail system. (0486 2-02)

Public Comment: In reference to page 133-135 of the *Public Hearings Report*, commenter questions why light-rail would have to follow the same alignment as Metrorail, and why it would not go to Reston Town Center. Believes the consultants are short-shrifting the flexibility of light-rail in terms of routing. (0112, 2-06)

Public Comment: Supports the implementation of light rail because the overall project costs as well as annual operating costs are much cheaper than those of BRT and Metrorail. States that the Project Team has pushed BRT instead of light rail in the DEIS, because BRT would better serve the interests of the Project Team. (0486 2-01)

Public Comment: States that the claim of light rail needing to be grade separated is ungrounded. From a cost and community impact standpoint, the commenter states that the Project Team should have examined other alignments, because all of the proposed alternatives have the same alignment, except for the Tysons Corner segments. (0112, 2-10)

Response: *A number of other modes were considered for the project, including light rail. Light rail was studied as part of the Major Investment Study for the Dulles Corridor Rapid Transit Project, and was requested again during the Scoping Process for the preparation of the Draft EIS. As part of the Draft EIS process, the Project Team reconsidered light rail. The Project Team reviewed the findings of the analysis performed during the Major Investment Study and found the analysis to be valid. Therefore, light rail was eliminated from further consideration and was not fully analyzed in the Draft EIS. The reasons for the elimination of this alternative are fully detailed in the* Final Alternatives Analysis Report (May 2001), *and are summarized below.*

Light rail is often proposed as an alternative to Metrorail as a lower cost solution, because it can operate in existing roadway rights-of-way, and does not require a fully-grade separated alignment. However, in the Dulles Corridor, light rail would follow the same alignment as the Metrorail Extension. Different alignments for light rail, including off-median alignments that directly served town centers in the Mid-corridor, were considered during the MIS, but were determined to be less cost effective than a median alignment. In locations where the Metrorail Extension diverges from the median and is grade-separated, light rail would also have to be grade-separated. In Tysons Corner, light rail would have to be elevated or underground to avoid existing traffic; and at Dulles Airport, light rail would need to be underground to avoid visual impacts to the historic airport terminal. For the remainder of the alignment, both light rail and Metrorail would operate at grade; therefore, light rail would not likely offer a substantial cost savings over Metrorail.

The Metrorail Extension capital costs average $150million per mile, including all vehicles, right-of-way, roadway work, and escalation to year of expenditure. The costs for a light rail system will vary depending on alignment, grade separation, station configuration, and environmental constraints. Though some light rail systems have cost approximately $25 to 40 million per mile to build, other systems have cost much more. As noted in the technical memorandum for light rail in the Final Alternatives Analysis Report*, the first mile of the Newark-Elizabeth Rail Link in downtown Newark, New Jersey cost $141 million per mile.*

Use of light rail would force a transfer at the Orange Line (or at the Tysons West Station if Metrorail is used through Tysons Corner) for passengers traveling between the corridor and the region's core, reducing ridership on the Dulles Corridor line. As noted in the comment, this transfer would be a high-quality transfer, similar to the transfer between two Metrorail lines; however, because transfers introduce additional wait time and travelers are generally resistant to changing vehicles once they have started a trip, transfers typically incur an additional penalty in models. The more time that a traveler would have to spend waiting for a transit vehicle or changing between transit vehicles, the less attractive transit becomes. The ridership estimated in the MIS demonstrated the effect of this transfer would reduce ridership on the line by approximately 20 percent. Overall, the combination of reduced ridership and similar capital costs would result in lower cost effectiveness for a light rail alternative than for the Metrorail Extension.

Because light rail and Metrorail would have the same degree of grade separation, light rail would not be less intrusive than Metrorail. In fact, elevated light rail would be visually more intrusive than Metrorail. Because a light rail alternative would be powered by overhead catenary wires, the visual profile of an elevated light rail alternative would be higher than that for Metrorail. In addition to the elevated structure, the light rail alternative would include catenary poles and wires extending another 22 feet above the top of the structure. As a result, in the Tysons Corner area, an elevated light rail system would have greater impacts on area aesthetics.

Reduced Density as a Result of Light Rail

Public Comment: On the quality of life, Light Rail would call for significantly less density since the cost of it is far less. In fact, it is affordable rail. This would result in reduced density and a reduction in office buildings and resident housing. This would alleviate traffic congestion, poor air quality and traffic, and

pedestrian safety concerns. It would allow for timely responses from our ambulances, fire, and police. And, of course, we will not be faced with the Great Wall of China dividing our community. (0189, 0201-L – 6)

Public Comment: Build the Light Rail now, reduce density, and preserve the quality of life in Reston and save Restonians over four billion dollars. These are noble goals and ones that can be achieved. Let's do it. (0189, 0201-L –7)

Public Comment: Do you need this density to support light rail? Light rail estimate cost being around 600 million dollars. (0189, 0448-E –3)

> ***Response***: *A number of other modes were considered for the project, including light rail. Light rail was studied as part of the Major Investment Study for the Dulles Corridor Rapid Transit Project, and was requested again during the Scoping Process for the preparation of the Draft EIS. As part of the Draft EIS process, the Project Team reconsidered light rail. The Project Team reviewed the findings of the analysis performed during the Major Investment Study and found the analysis to be valid. Therefore, light rail was eliminated from further consideration and was not fully analyzed in the Draft EIS. The density bonuses proposed for the Dulles Corridor are not linked to the cost of the alternative. The bonuses are linked to station locations and the mode of the alternative. If light rail had not eliminated from consideration, it is likely that similar density bonuses would have been considered for light rail.*

Limitations of Light Rail

Public Comment: Light rail has been discussed, but light rail has the same problem, it runs on grade and across roadways, and if the roadways are congested, we have the same problem. Light rail cars cannot move. (0144, 0144-T –6)

> ***Response:*** *A number of other modes were considered for the project, including light rail. Light rail was studied as part of the Major Investment Study for the Dulles Corridor Rapid Transit Project, and was requested again during the Scoping Process for the preparation of the Draft EIS. As part of the Draft EIS process, the Project Team reconsidered light rail. The Project Team reviewed the findings of the analysis performed during the Major Investment Study and found the analysis to be valid. Therefore, light rail was eliminated from further consideration and was not fully analyzed in the Draft EIS.*
>
> *Because of the problems noted by the commenter, an at-grade light rail alignment would not be appropriate in Tysons Corner. A light rail line would have to be elevated in Tysons Corner to avoid traffic congestion, and would have to be underground at Dulles International Airport to avoid impacts to the historic terminal. In other areas, both Metrorail and light rail would be built at-grade, thus light rail would have no cost advantage. Because light rail cannot run on the same tracks as Metrorail, passengers would be forced to transfer at West Falls Church to continue their journey on Metrorail, this would decrease ridership.*

Need to Reexamine Cost Estimates

Public Comment: States that the costs for Metrorail are low-balled and the costs for light rail need to be reexamined. Cites Corridor Cities Draft EIS, which quotes $1B for a 14-mile light rail system. Believe that heavy rail costs are higher because vehicles are built in Brazil and Spain. In contrast, there are more manufacturers of light rail cars. (0112, 2-07)

> ***Response:*** *The capital cost estimates for Metrorail are in year-of-expenditure dollars, meaning that the estimates include the effects of future inflation. The cost estimates for the Build Alternatives are all based on the same methodology. Cost comparisons between one project and another can be misleading, especially when comparing different transit technologies (e.g., light rail and heavy rail*

Public Comment: Believes information regarding transfers from downtown D.C. to Loudoun County is misleading and inaccurate. Refers to the Georgetown Branch Trolley project, which would include a 500-foot transfer to light rail at Bethesda, and would have a sizable ridership at much less cost. (0112, 2-08)

> ***Response:*** *For trips between the corridor and the core, Metrorail would generally require fewer transfers than other proposed modes because it would not require a transfer where the Dulles Corridor Metrorail Extension meets the Orange Line. Though some trips would require a transfer elsewhere in the Metrorail system, other mode alternatives would always require one more transfer than the Metrorail Extension, because they would always have the forced at West Falls Church Station.*

Need to Examine Alternative Alignments

Public Comment: States that the Project Team is inviting a lawsuit by not examining other alignments and impact-mitigation measures, such as going underground at Hallcrest Heights and near the West Falls Church Yard. (0112, 2-09)

> ***Response:*** *Since the early 1970's, the planning for the connection between the Orange line and the Metrorail Extension has always incorporated the use of at-grade and aerial methods of construction for connecting the guideway between the median of I-66 and the median of the Dulles Connector Road. Provisions for this connection were made with the original construction of the Orange line in the early 1980s, including the construction of a pier and foundation between the Orange Line tracks to facilitate such an aerial guideway to minimize eventual disruption to the Orange Line during construction.*
>
> *The impacts and costs for underground construction of this connection were not evaluated as part of any alternative considered. Making this connection would present extremely complex construction challenges to maintain the Orange Line fully operational and not impact both directions of I-66, a major interstate highway. Due to its complexity, the cost of this underground construction for this segment would be significantly greater than typical cut and cover construction, and many times greater than the planned at-grade and aerial construction.*
>
> *The current alignment for the West Falls Church Yard lead track is partially underground as it goes beneath the eastbound Dulles Connector Road lanes and enters the rail yard. The remaining portion of the yard lead in the median of the Dulles Connector Road will be on aerial structure in order to meet the grade from the both the inbound and outbound project tracks descending from the flyover across I-66.*
>
> *For reasons of cost that are similar to the Orange Line Junction, the Project Team has not considered an underground section of the Metrorail Extension between the Dulles Connector Road and Route 123.*

Failure to Study Alternatives

Public Comment: So before we spend $2 billion to get rail into Tysons Corner, we're to find something that might work, monorail. There are other alternatives that have never been studied. We ought to consider these land use applications along with the transportation impacts they would have, which hasn't been done. The county's transportation staff has not only - they're on the bench, but they're not even on the bench, they're out of the stadium. (0136, 0168-T –4)

Public Comment: THE DEIS FAILS TO CONSIDER OTHER ALTERNATIVES: Example of other types of service that should have been included are monorail, dial-a-ride, transit, ridesharing, HOT lanes, and many others. (0138, 0476-L –6)

Public Comment: I don't understand why VDRPT studied monorail and light rail (all modes, essentially) for the Route 28 and Capital Beltway Corridor studies, but not for Dulles Rail? (0112, 0382-L –24)

Public Comment: WMATA and VDRPT also failed to study other modes (such as light rail, monorail and carpool/HOT lanes), though there is precedence for VDRPT to do this as with the Route 28 and Capital Beltway Corridor studies. (0112, 0462-L –2)

Public Comment: I am perplexed that light rail and monorail were not studied when DRPT studied these modes for the Route 28 and Capital Beltway Corridor studies. I understand WMATA has no experience operating light rail or monorail, but note that WMATA is considering light rail to service the district. (0112, 0462-L –45)

Public Comment: WMATA and VDRPT must do at least a financial, environmental and trip forecasting analysis of other alternative transportation modes. Such data should be generated for light rail, monorail, and allowing HOV and "HOT" lanes on the Dulles Access Road coupled with BRT. VDRPT studied HOT lanes, monorail and light rail for the Capital Beltway Corridor Study and Route 28 study, but these modes were summarily rejected because WMATA has no experience in this regard. But VDRPT is a significant partner in this DEIS and thus, if it studied these modes in the aforementioned studies, they should be studied for Dulles rapid transit. (0112, 0462-L –51)

Public: Dulles Road median & use monorail to service Tysons. (0073, 0073-CC-3)

Public Comment: Recent Washington Post articles indicate that WMATA has new focus on BRT and light rail solutions for other corridors because of high cost of heavy rail. (0488 02)

Public Comment: Cites examples of light rail systems around the country that show rail works better than bus service. Metrorail provides faster service at lower operating cost than most LRT lines so should be even more successful, as it has been on the first 103 miles. (0013, 2-03)

> ***Response:*** *While NEPA requires an evaluation of all reasonable alternatives, it allows alternatives to be eliminated prior to detailed studies as long as the reasons for eliminating them are discussed in the EIS. The process used for evaluating the initial list of alternatives for the Dulles Corridor Rapid Transit Project was a two-phase process: initial screening and intermediate screening. The process applied increasingly detailed and comprehensive measures of effectiveness to a decreasing number of alternatives. For the initial phase most measures were qualitative. The alternatives advanced or carried forward for further evaluation at the end of each phase were those alternatives that best met the transportation needs of the corridor, relative to the other alternatives under consideration.*
>
> *As detailed in Section 2.6 of the Draft EIS, numerous alternatives, including alternative modes of transportation, were studied prior to conducting the detailed evaluation of BRT and Metrorail that are presented in the Draft EIS.*
>
> *Monorail was considered for the Dulles Corridor Rapid Transit Project during the early stages of the Draft EIS process. The reasons in DRPT's Dulles Corridor Transportation Study (June 1997), a major investment study (MIS) for dismissing monorail were re-evaluated to determine if they were still valid. Overall, it was found that these reasons are valid. Though monorail is capable of supporting high-speed, high-capacity service, few such systems are in operation over long distances. It was decided that the Dulles Corridor was not an appropriate test corridor for a long distance application. These and additional reasons for eliminating monorail from more detailed study in the Draft EIS are explained fully in the Final Alternatives Analysis Report (May 2001). Some findings are summarized in previous responses addressing monorail. Updated cost information is also presented.*
>
> *WMATA in cooperation with the District of Columbia Department of Public Works is considering several alternative modes and alignments in multiple corridors within the District of Columbia.*

Light rail is often proposed as an alternative to Metrorail as a lower cost solution, because it can operate in existing roadway rights-of-way, and does not require a fully-grade separated alignment.

Light rail was also studied during the early stages of the Draft EIS process. The Project Team reviewed the findings of the analysis performed during the MIS and found the analysis to be valid. Light rail would not be as cost-effective as Metrorail because it would require a transfer at the Metrorail Orange Line, which would reduce ridership in the Dulles Corridor. Also, the capital costs for light rail would be similar to those for Metrorail because it would have to follow the same grade-separated alignment as a Metrorail alternative through Tysons Corner and at Dulles Airport, reducing any potential cost-savings benefits. The reasons for eliminating light rail from more detailed study in the Draft EIS are explained fully in the Final Alternatives Analysis Report (May 2001). Some findings are summarized in previous responses addressing light rail.
Dial-a-ride transit is a form of demand-responsive service. It is intended to serve areas where demand is too low for a conventional transit service. This is not the case in the Dulles Corridor. Some demand-responsive services are already operated in the corridor by Fairfax and Loudoun counties, but these services are intended to provide access for disabled and elderly persons who cannot use the conventional transit services provided by the counties.

The issues associated with encouraging increased ridesharing and implementing a high-occupancy toll system in the Dulles Corridor, as well as the possible benefits of such alternatives, were explored as part of the Project Team's review of the range of alternatives posted on the Dulles Plan B web site. A summary of the Team's findings are within this Appendix.

Need to Reanalyze BRT

Public Comment: I would urge that the EIS go back and reanalyze the BRT option. A review of the findings for the BRT alternative indicated that the analysis was done by placing buses in the congested travel lanes and on the shoulder lanes of the Dulles Toll Road. Therefore, I request that the BRT alternative be reanalyzed where you will use statistics derived by putting buses in the dedicated lane such as that is found in the rapid bus program. (0147, 0249-T –2)

Public Comment: According to the DEIS, BRT vehicles would travel in the regular traffic lanes of the Dulles Connector Road, the bus lane on the roadway shoulder, regular travel lanes of the Dulles Greenway, and in a limited number of BRT routes, BRT vehicles would use the HOV lanes of the Dulles Toll Road. (S-12) Completing the data analysis based on the above, BRT is made to be less competitive with respects to the rail. To ensure that the planning process gives fully objective treatment to BRT, data analysis should be based on all BRT travel is in a dedicated lane. (0147, 0459-L –4)

Response: *As shown in Chapter 6 of the Final EIS, the Dulles International Airport Access Highway currently operates at Level of Service (LOS) C during the peak period. This level of service represents moderately congested conditions and relatively free-flow travel speeds. By 2025, the DIAAH is expected to operate at LOS D. This level of service represents more congested conditions, but speeds are only reduced moderately, and, in practice, it is widely considered an acceptable level of service. The HOV lane on the Dulles Toll Road currently operates at LOS C and is expected to continue operating at LOS C under all alternatives. Therefore, to have introduced BRT vehicles to the DIAAH and the HOV lane would not have hindered traffic operations on the roadway, nor would the expected levels of roadway traffic have hampered BRT operations.*

BRT operating in a dedicated third lane on the Dulles International Airport Access Highway was an alternative requested during the Scoping Process for the preparation of the Draft EIS. This alternative was evaluated during the early stages of the Dulles Corridor Rapid Transit Project, and was eliminated from further study. The reasons for the elimination of this alternative are fully detailed in the Final Alternatives Analysis Report (May 2001), and are summarized below.

Data from MWAA and Project Team estimates showed that current and future traffic projections for the existing configuration of the DIAAH do not warrant construction of a dedicated lane as part of the Dulles Corridor Rapid Transit Project. Because the DIAAH only provides service to and from the airport and does not serve general traffic, it is expected that traffic flow on this road during peak periods will be, at worst, moderately congested. This flow of traffic would not interfere with the speed or reliability of bus operations in the DIAAH. When traffic flow on the DIAAH degrades, the Metropolitan Washington Airports Authority (MWAA) plans to build an additional lane for all airport traffic.

The reasons for the elimination of BRT from further consideration are presented in the Final EIS in its Executive Summary (pages S-9 and S-10) and in Section 2.2, Draft EIS Alternatives and Recommendations.

Need to Address Linkages with Adjacent Projects

Public Comment: Linkages: The Draft EIS does not indicate that consideration was given to the rapid transit mode that might be used on the Beltway in both Virginia and Maryland and how the current project would link with it. New transit systems on the major corridors should be compatible. DRPT should review the results of the March 2001 report on the alternatives for transit on the beltway and reflect how and why these systems should be compatible. Rationale: Delegate David Albo legislated a study of possible rail on the Beltway. As of the time of the scoping meetings, several modes were still under consideration: heavy rail, light rail, and monorail. It would seem wise to have compatible modes of transit on the Beltway and out the Dulles Corridor so the systems could be easily linked. (0402, 0402-L –9)

Response: *A Project alignment that would provide a connection to a future transit line in the Beltway corridor was examined during the early stages of the Dulles Corridor Rapid Transit Project, and was eliminated from further study. The reasons for the elimination of this alternative are fully detailed in the* Final Alternatives Analysis Report (May 2001) *and are summarized below.*

The plans for future transit in the Beltway corridor are not advanced enough to make it appropriate or feasible to conduct detailed coordination efforts related to these improvements. The Capital Beltway Corridor Rail Feasibility Study includes recommendations for further evaluation of several transit modes and alignments in the Beltway corridor. Further study would be necessary to advance Beltway Rail plans to the level that coordination would be possible.

Since publication of the Final Report in March 2001, the recommendations of the Capital Beltway Rail Feasibility Study have not been advanced further.

Need to Evaluate Alternative Alignments

Public Comment: How come you did not consider alignments that would serve existing densities, such as Reston Town Center or downtown Herndon? (0112, 0382-L –6)

Public Comment: How come most of the alignment is in the Toll Road? (0112, 0382-L –7)

Public Comment: I would like to express concerns over the route and method of moving people you have chosen.#1) I think running the train down the median of the highway is a big problem for the following reasons: - This leaves no possibilities for walkable Transit Oriented Development at the stations (The Orange Line along Clarendon was originally supposed to go along the highway median, and was changed to the present route. This allowed the creation of all the dense, walkable places that exist along the corridor. This will not happen with the train down the center of the highway).-This requires additional transit such as BRT which people will be required to transfer to, and many people won't ride if they have to transfer 2 times -This requires the riders to be "stuck" in the middle of the highway as they ride, which is quite an unpleasant experience.(0110, 0110-E –1)

Public Comment: I believe that alternative modes and alignments should be studied, including heavy rail and BRT alignments that will put stations near existing density (i.e., Reston Town Center and downtown Herndon, or Dulles Town Center). Cost per rider and other cost figures should be generated, too. (0112, 0462-L –46)

Public Comment: It is far better to select a route that goes under or through low density office parks and mall that can be redeveloped into dense walkable communities right directly at the Metro stations. Planning with a connection of a BRT is a bad idea and will cost a lot of potential riders. The center of the highway is not a friendly place to be, to go to, or to be waiting for a train. With all the noise, car fumes, and dust and dirt flying, this is asking a lot to make people wait in this inhospitable place to use public transit. Most will just drive instead if the train experience is not great. The train stations need to be in the center of the communities, and a short walk to people's homes and workplaces. They need to be accessible directly, and not through having to wait for another form of transit and then to transfer. When public transit becomes more hassle than driving, people will just keep driving. (0110, 0110-E –3)

Public Comment: The environmental impact statement should analyze the potential for increased ridership that might result from stations within the Reston Town Center and other built-up locations. (0066, 0254-T –4)

Response: *While NEPA requires an evaluation of all reasonable alternatives, it allows alternatives to be eliminated prior to detailed studies as long as the reasons for eliminating them are discussed in the EIS. The process used for evaluating the initial list of alternatives for the Dulles Corridor Rapid Transit Project was a two-phase process: initial screening and intermediate screening. The process applied increasingly detailed and comprehensive measures of effectiveness to a decreasing number of alternatives. For the initial phase most measures were qualitative. The alternatives advanced or carried forward for further evaluation at the end of each phase were those alternatives that best met the transportation needs of the corridor, relative to the other alternatives under consideration.*

As described in Section 2.6 of the Draft EIS, during the early stages of the EIS process, a number of station and alignment alternatives were considered for the Dulles Corridor Rapid Transit Project, including an alignment that diverged from the DIAAH to provide direct service to Reston Town Center (Alignment D2). This alignment was eliminated from more detailed study because it would have followed the Washington & Old Dominion Railroad Regional Park, and, therefore, was not consistent with existing land use, nor with local or regional land use plans. Because Alignment D2 would preclude the continued use of the W&OD Railroad Regional Park in certain areas, and because the DIAAH median alignment is a prudent and feasible alternative to the use of this parkland, Alignment D2 was eliminated from further consideration, consistent with Section 4(f) of the U.S. Department of Transportation Act of 1966 (which protects public park and recreation lands, wildlife and waterfowl refuges, and historic sites). These reasons for eliminating Alignment D2 from more detailed study in the Final EIS are explained fully in the Final Alternatives Analysis Report (May 2001).

In addition, as part of the light rail alternative analysis, the Final Alternatives Analysis Report *documents the analysis in DRPT's Dulles Corridor Transportation Study (June 1997), a major investment study (MIS) that led to the elimination of off-median alignments. It was determined during the MIS process that a DIAAH median alignment would be the most cost-effective alignment. A number of off-median alignment and station options were examined, including an alignment with urban-center stations at Dulles Corner and Reston Town Center. These options were primarily dismissed due to much higher capital costs, relative to the median alignment option. High costs were associated with the structures that would be required to leave the median of the DIAAH, elevated guideway through the town centers, elevated stations, and the land acquisition required for right-of-way through the town centers. In addition, analysis for the Dulles Corridor Rapid Transit Project concluded that at-grade, off-median alignment options would be less attractive than the median alignment because at-grade operation through town centers would increase travel times through the corridor. These reasons are explained more fully in the Final Alternatives Analysis Report (May 2001).*

Please note that the design of the Metrorail median stations includes features to protect patrons from highway noise and dirt on both the platform and mezzanine levels. In addition, given the

frequent service of the Metrorail Extension, patrons will not have to spend significant time on the platforms.

Service to Tysons Corner

Public Comment: Recommendation - It seems much more efficient and cost effective to connect Tysons Corner to the Dulles Corridor heavy rail at the eastern and western ends and to install a lighter rail system, such as monorail, that can circulate through Tysons Corner to serve all parts of it. This system could be connected to the Dunn Loring Metro station to provide even better service. And, all of this could probably be provided at less cost that trying to put heavy rail through "downtown" Tysons Corner. (0086, 0086-CC-3)

Public Comment: Service to Tysons Corner - The proposed rail alternatives do not seem to provide adequate service to Tysons Corner. Three of these alternatives (T1, T6, T9) have only a single line through the middle of Tysons Corner. It is not clear that the proposed alternatives are any better than the alternative to serve Tysons Corner with a circulator system (alternative T8) that was eliminated in the Initial Screening Phase. The Draft EIS should be revised to include the T8 alternative and provide more details about the adequacy of service to Tysons Corner that could be provided by each of these alternatives. Rationale: The T1, T6, and T9 alternatives appear to leave much of Tysons Corner beyond walking distance from the stations. Alternative T4 does not appear to be a very practical solution because of the divided directional lines and the inconvenience this would cause riders. The EIS does not provide any information about that portion of the Tysons Corner workers and residents would be served by these alternatives. The rejected T8 alternative could be as good or better than the proposed rail alternatives but this cannot be determined because of inadequate information in the EIS. (0402, 0402-L –6)

Public Comment: However, upon further reflection and given the apparent likelihood that substantial funding for this project will be required from transportation tax districts and higher tolls, fairness and equity for those providing much of this revenue demands and the Alliance supports the following new phasing strategy:

Phase I – Bus Rapid Transit or increased express bus service from West Falls Church to Reston, Dulles and Eastern Loudoun until funds are in place to construct Phase II.

Phase II – Rail from East Falls Church along and totally within the Dulles Corridor to Tysons Corner, Reston, Herndon, Dulles Airport and Eastern Loudoun County. In this Phase Tysons would have stops only at Spring Hill and possibly Route 123.

Phase III – Construct a rail loop or transit circulation system within Tysons Corner.

Given that the most likely funding strategy will require a substantial investment from corridor property owners and toll road users, all owners and users must receive a return on their investment at approximately the same time. The above phasing approach meets that test. (0446, 0446-E –3)

Public Comment: The concept of rapid transit to Dulles is sound but the servicing of Tysons is both overly costly and very inefficient. The $1 billion cost could be reduced substantially by providing several rail stations along the corridor. These would be connected with a monorail system in Tysons which could provide satisfactory circulation for both transit riders and the residents, shoppers, employees, etc. Monorail is a mature technology currently employed in Tokyo (26 mile, 180K riders per day), Seattle (where the line is being expanded), and Sydney, Australia (where the line goes over the main street with a minimum footprint). The proposed location of rail stations would still require addition of an internal circulation system in order to reduce vehicular dependence. (0119, 0119-L –1)

Public Comment: It is not clear why a separate circulation system of some kind (for example, feeder buses or a monorail system) has been completely eliminated from consideration as part of the proposed rail alternatives in Tysons Corner. This appears to be needed because the 1/2 mile radius areas around the proposed rail stations that is used as walking distance leaves much of the Tysons Corner area

beyond walking distance. The EIS should state how much additional ridership would result from adding a circulation system serving the northern and southern parts of the Tysons Corner area to the proposed T1, T4, T6, and T9 alternatives. (0392, 0392-L -12)

> ***Response:*** *A significant percentage of the Tysons Corner core area is within reasonable walking distance of the proposed stations. It is anticipated that employee shuttles will be provided by many of the major employers in Tysons Corner, in addition to Fairfax County's planned circulator bus routes, and other feeder bus routes that will serve the stations. Provision of moving sidewalks to extend the pedestrian reach from the stations would not be practical or cost effective.*
>
> *A fixed-guideway circulator system in Tysons Corner was studied as part of DRPT's Dulles Corridor Transportation Study (June 1997), a major investment study (MIS), and was requested again during the Scoping Process for the preparation of the Draft EIS. As part of the Draft EIS process, the Project Team reconsidered the circulator concept. The Project Team reviewed the findings of the MIS analysis and found the analysis to be valid. Therefore, a circulator was eliminated from further consideration and was not fully analyzed in the Draft EIS or in the Final EIS. The reasons for the elimination of this alternative are fully detailed in the Final Alternatives Analysis Report (May 2001).*

Public Comment: Alternative fuel buses should be used. Evaluate the use of hybrid gasoline-electric, hybrid natural gas-electric, and hydrogen fuel cell powered buses. Alternative fuel buses will lead to a significant reduction in the region's air pollution. (0487 2-01)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS. Gasoline and/or diesel buses were considered in the Draft EIS to provide a worst case scenario in terms of air quality and energy consumption.*

Alternative Fuel Vehicles

Public Comment: Develop an alternative that does not utilize Metrorail, but uses only alternative fuel buses. (0487 2-02)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS. The BRT Alternative did not include Metrorail. The types of fuels used by BRT vehicles, , would have been determined during the later stages of the project. The types of fuels used by feeder buses will also be determined by the transit operators of those buses, including WMATA, Fairfax County, and Loudoun County.*

Need to Provide More Seamless Service

Public Comment: Project alternatives should address the access of buses to eliminate multiple transfers of passengers. More auto drivers might use transit if they were not required to transfer several times to other transit vehicles. (0487 2-03)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS. Certain BRT trips would have involved a bus-to-bus transfer and a bus-to-rail transfer.*

Consideration of Alignment T8 with feeder system and its reconsideration

Public Comment: Routes thru Tysons are foolish & add enormous cost. Better to keep rail in the Dulles Road median & use monorail to service Tysons. (0073, 0073-CC-3)

Public Comment: Recommendation - It seems much more efficient and cost effective to connect Tysons Corner to the Dulles Corridor heavy rail at the eastern and western ends and to install a lighter rail system, such as monorail, that can circulate through Tysons Corner to serve all parts of it. This system could be connected to the Dunn Loring Metro station to provide even better service. And, all of this could probably be provided at less cost that trying to put heavy rail through "downtown" Tysons Corner. (0086, 0086-CC-3)

Public Comment: Service to Tysons Corner - The proposed rail alternatives do not seem to provide adequate service to Tysons Corner. Three of these alternatives (T1, T6, T9) have only a single line through the middle of Tysons Corner. It is not clear that the proposed alternatives are any better than the alternative to serve Tysons Corner with a circulator system (alternative T8) that was eliminated in the Initial Screening Phase. The Draft EIS should be revised to include the T8 alternative and provide more details about the adequacy of service to Tysons Corner that could be provided by each of these alternatives. Rationale: The T1, T6, and T9 alternatives appear to leave much of Tysons Corner beyond walking distance from the stations. Alternative T4 does not appear to be a very practical solution because of the divided directional lines and the inconvenience this would cause riders. The EIS does not provide any information about that portion of the Tysons Corner workers and residents would be served by these alternatives. The rejected T8 alternative could be as good or better than the proposed rail alternatives but this cannot be determined because of inadequate information in the EIS. (0402, 0402-L –6)

Public Comment: However, upon further reflection and given the apparent likelihood that substantial funding for this project will be required from transportation tax districts and higher tolls, fairness and equity for those providing much of this revenue demands and the Alliance supports the following new phasing strategy:

Phase I – Bus Rapid Transit or increased express bus service from West Falls Church to Reston, Dulles and Eastern Loudoun until funds are in place to construct Phase II.

Phase II – Rail from East Falls Church along and totally within the Dulles Corridor to Tysons Corner, Reston, Herndon, Dulles Airport and Eastern Loudoun County. In this Phase Tysons would have stops only at Spring Hill and possibly Route 123.

Phase III – Construct a rail loop or transit circulation system within Tysons Corner.

Given that the most likely funding strategy will require a substantial investment from corridor property owners and toll road users, all owners and users must receive a return on their investment at approximately the same time. The above phasing approach meets that test. (0446, 0446-E –3)

Public Comment: The concept of rapid transit to Dulles is sound but the servicing of Tysons is both overly costly and very inefficient. The $1 billion cost could be reduced substantially by providing several rail stations along the corridor. These would be connected with a monorail system in Tysons which could provide satisfactory circulation for both transit riders and the residents, shoppers, employees, etc. Monorail is a mature technology currently employed in Tokyo (26 mile, 180K riders per day), Seattle (where the line is being expanded), and Sydney, Australia (where the line goes over the main street with a minimum footprint). The proposed location of rail stations would still require addition of an internal circulation system in order to reduce vehicular dependence. (0119, 0119-L –1)

Public Comment: It is not clear why a separate circulation system of some kind (for example, feeder buses or a monorail system) has been completely eliminated from consideration as part of the proposed rail alternatives in Tysons Corner. This appears to be needed because the 1/2 mile radius areas around the proposed rail stations that is used as walking distance leaves much of the Tysons Corner area

beyond walking distance. The EIS should state how much additional ridership would result from adding a circulation system serving the northern and southern parts of the Tysons Corner area to the proposed T1, T4, T6, and T9 alternatives. (0392, 0392-L -12)

Public Comment: We would have preferred the so-called T-8 alternative that proposed main line, at-grade trackage with a circulation feeder system to serve Tysons, but that was dropped during the Alternatives Analysis - prematurely, in my view. (0137, 0176-L –2)

Public Comment: Please put the T-8 option back on the table, that's the single station option. Let's not rush through in 30 days decisions that cannot be undone or corrected in a lifetime. (0148, 0148-T –8)

Public Comment: It is almost too easy to imagine attractive monorail or other circulating transportation system taking people to and from a single rail stop at the periphery of the city of Tysons Corner, while simultaneously serving the thousands of people who populate and need to circulate in and around these cities by day and by night. (0148, 0148-T –6)

Public Comment: I believe that a single heavy-rail station with a connection to a light rail or monorail loop is a more appropriate solution for transportation within Tysons Corner. Monorail or light rail would allow for three or four times the number of stations and offer more frequent trains. Which would you rather do? Be delivered directly to a station up to a mile from your destination, or change trains and end up a few blocks from where you're going? I submit to you that most commuters would prefer the latter. (0178, 0178-T –3)

Public Comment: It is disappointing that WMATA has prematurely chosen to dismiss the very viable T-8 alternative. It is in the region's best interest to first extend rail out to Dulles to provide the majority of commuter with mass transit opportunities and then focus on Tysons Corner. The T-8 feeder system to and at grade, main line metro system, would be a simpler, more timely, less expensive option that would provide through-commuters with more expedient access without delay. (0150, 0150-T –2)

Public Comment: The T-8 alternative should be reincluded for consideration. (0150, 0150-T –9)

Public Comment: A variation on the T-8 option, which was eliminated during the initial draft environmental impact statement screening phase, should be reevaluated. The draft environmental impact statement indicated that T-8 was eliminated because ridership would be lower due to the need to transfer trains. Yet the same document advanced the screwball T-4 alignment, wherein a third of the riders not only have to change trains, but they have to go all the way through Tysons and then backtrack to their destination. (0178, 0178-T –6)

Public Comment: It is disappointing to learn that the T-8 option, Tysons feeder option, has been summarily dismissed because it was determined that the Springhill Road station was inappropriate and should be rejected. By all appearances, the T-8 feeder monorail, light rail or personal rapid transit system compared to an at-grade main line metro system, could be a less expensive, greater ridership option that could provide through commuters less delay to their destination and a broader range of coverage for Tysons Corner residents and employers. A transfer the Dulles Silver Line to the Tysons feeder system is similar to a transfer at Roslyn to continue to National Airport or a transfer to Metro Center to the Red Line. This option needs to be revisited. (0179, 0179-T –5)

Public Comment: Though the option was eliminated from consideration in the recent Draft EIS study, is it too late to take another look at keeping the primary Metrorail system in the Dulles Corridor with a greatly upgraded Tysons station at Spring Hill Road / Dulles Highway? Could we then use the billion plus dollars of the proposed through-Tysons rail loop to fund the construction of a state-of-the-art people mover system serving even more of Tysons Corner? Of course, such a system would, of necessity, be elevated. It would have to be to avoid ground level congestion. However, the people mover guideway could be far less obtrusive than the conventional double track Metrorail platform. A people mover system could run more frequent service throughout Tysons serving a full range of internal trips as well as rail transit trips from outside. How many purely internal Tysons trips could be added to the transit-originated trips? No

more getting into your car to do lunch at a Tysons restaurant! With Metrorail bypassing three of the four internal Tysons stations, service to Dulles airport and communities west of Tysons could be speeded up, both in terms of normal travel time and also in terms of the initial construction time. Meanwhile the internal people mover system could serve far more stations throughout Tysons. Yes, this would add an additional mode transfer for transit-originated trips. However, it is entirely likely that the net portal-to-portal trip would actually be faster for many transit users even transferring modes. Surely the technology needed to make such a system effective is already at hand. Would the net cost really exceed what is currently planned for the Metrorail stations? Probably not. Wouldn't spreading the direct economic benefit of transit throughout a broader geographic area within Tysons ultimately generate greater tax revenues to finance such a system? Yes, the option isn't on the table today, but shouldn't it be? (0088, 0088-L –3)

Public Comment: The EIS does not show how the ridership for the proposed Tysons Corner rail alternatives T1, T4, T6 and T9 compares to Alternative T8 that was eliminated from further consideration at the Initial Alternatives Screening phase. It is not clear that the alternatives proposed in the draft EIS provide significantly greater ridership in Tysons Corner for the investment than the T8 alternative. The EIS should be revised to compare the ridership of the proposed Tysons Corner alternatives and the T8 alternative. If ridership is similar, the EIS should be revised to include the T8 alternative. (0392, 0392-L – 13)

Public Comment: The study never considered a secondary distribution system through Tysons Corner. (0162, 2-06)

Public Comment: Cannot support heavy rail through Tysons Corner for the following reasons:

- Aerial and surface rail in Tysons Corner are an albatross – very unsightly, a blight environmentally, and invasion on business and hotel guests, and a visual intrusion for everyone in and near Tysons Corner. It is difficult to envision aerial heavy rail 90 feet above ground level and the impact this might have on the reputation and vitality of the area.
- Cost – Installing heavy rail through Tysons Corner will cost over $1 billion whereas the cost of heavy rail from the current Orange Line to Route 772 in Loudoun County will be $1.7 billion.
- Service – Three heavy rail stations within Tysons Corner do not truly serve the residents, businesses, or visitors effectively. Tysons Corner needs a transit circulation system, not the system recommended in the Draft EIS. (0086, 0086-CC-2)

Response: *While NEPA requires an evaluation of all reasonable alternatives, it allows alternatives to be eliminated prior to detailed studies as long as the reasons for eliminating them are discussed in the EIS. The process used for evaluating the initial list of alternatives for the Dulles Corridor Rapid Transit Project was a two-phase process: initial screening and intermediate screening. The process applied increasingly detailed and comprehensive measures of effectiveness to a decreasing number of alternatives. For the initial phase most measures were qualitative. The alternatives advanced or carried forward for further evaluation at the end of each phase were those alternatives that best met the transportation needs of the corridor, relative to the other alternatives under consideration.*

As detailed in Section 2.6 of the Draft EIS, numerous alternatives, including alternative modes of transportation, were studied prior to conducting the detailed evaluation of BRT and Metrorail that are presented in the Draft EIS. A fixed-guideway circulator system in Tysons Corner was studied as part of DRPT's Dulles Corridor Transportation Study (June 1997), a major investment study (MIS), and was requested again during the Scoping Process for the preparation of the Draft EIS. As part of the Draft EIS process, the Project Team reconsidered the circulator concept. The Project Team reviewed the findings of the MIS analysis and found the analysis to be valid. Therefore, a circulator was eliminated from further consideration and was not fully analyzed in the Draft EIS. The reasons for the elimination of this alternative are fully detailed in the Final Alternatives Analysis Report (May 2001), and are summarized below.

The MIS analysis demonstrated that a fixed-guideway feeder system (people mover) would not enhance ridership on a Dulles Corridor line that followed a Route 123-Route 7 alignment. Moreover, the analysis showed that such a feeder system would substantially add to the cost of the project. Although some components of a circulator may be less expensive than aerial Metrorail, it would be necessary to procure a separate vehicle fleet, and build a separate vehicle storage and maintenance facility, and a separate operations control center. With a Tysons-only circulator, these facilities would have to be located in Tysons Corner, and would require the acquisition of valuable property.

A low-level assessment of cost-effectiveness conducted during the MIS for various Metrorail-people mover combinations found that few options would be as cost-effective as the Route 123-Route 7 alignment without the people mover, and none were more cost-effective, indicating that the potential increases in ridership would not offset the costs of construction for the fixed-guideway system.

Because the feeder system would not substantially increase ridership on the Dulles Corridor line as a whole, it would be considered an unreasonable expenditure in the context of the project. Similarly, given that a loop configuration would provide more coverage of Tysons Corner and, therefore, benefit less from a circulator system, the Project Team for the Dulles Corridor Rapid Transit Project concluded that a feeder system would also be an unreasonable expenditure for a loop alignment.

Early in the MIS process, consideration of a median station alignment that connected to a feeder system was eliminated from detailed evaluation, because it was determined that this configuration would severely restrict access to Tysons Corner and would have potential adverse impacts on residential neighborhoods near the station site. It was also determined to be inconsistent with Fairfax County's economic development goals. In response to Scoping requests, the Project Team for the Dulles Corridor Rapid Transit Project reconsidered a feeder system connected to a DIAAH median alignment through Tysons Corner (Alignment T8). As noted above, the findings of the MIS team were reviewed and found to be valid.

For Alignment T8, the forced transfer of most passengers with an origin or destination in Tysons Corner would significantly reduce ridership on the system.

This configuration would not support the economic development goals of Fairfax County. The Fairfax County Comprehensive Plan, states, "the interests of the County as a whole are best served by a Metrorail transit system that penetrates the [Tysons Corner] core and brings riders to the jobs and shopping that are a major part of the foundation of the County's economic well-being." The "density bonuses" in the Comprehensive Plan would only be triggered by the development of "rapid transit stations." A circulator would not trigger these bonuses.

An Alignment T8 circulator would not be as cost effective as other proposed alternatives for Tysons Corner. The analysis in the MIS found that this option would decrease ridership on the line and in the corridor (because of the forced transfer) more than it would save in capital costs. It was also determined that a circulator option would cost more than an aerial Metrorail alignment through Tysons Corner. As noted earlier, a circulator would include costs for a separate vehicle fleet, a separate vehicle storage and maintenance facility, and a separate operations control center. With a Tysons-only circulator, these facilities would have to be located in Tysons Corner.

Public Comment: T-8 is not a current rail alignment, but was studied previously and is in the BRT alternative. Evaluation of this combination should not unduly delay the EIS. (0170, 0170-T –8)

Response: *The BRT 1 alignment was not similar to the Metrorail T8 alternative. The T8 alignment would have had a separate circulator in Tysons Corner, while BRT 1 would not have. T8 Metrorail alignment alternative was eliminated as documented in the Final Alternatives*

Analysis Report (May 2001) and was not evaluated in detail in the Draft EIS. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.

B. Supplemental Draft EIS Comments

Public Comments

Corridor Monorail Alternative

Public Comment: And why can't you build monorails, like Disneyworld? They are extremely quiet? (0011 0011-2)

Response: *The purpose of the Supplemental Draft EIS was to provide additional opportunities for the public and agencies to comment on refinements that have been made to the LPA since the publication of the Draft EIS Public Hearing Report (October 2002). During the early stages of the Draft EIS process, a number of other modes were considered for the Dulles Corridor Rapid Transit Project, including monorail. As documented in the Final Alternatives Analysis Report (May 2001)*, *monorail was eliminated from further study because it was not expected to offer cost savings in the Dulles Corridor and would result in reduced ridership due to a forced transfer at the Orange Line. As a result, the cost effectiveness of a monorail alternative was expected to be lower than that for the Metrorail Alternative, with the same high level of investment.*

2.2 Draft EIS Alternatives

A. Draft EIS Comments

Federal Agency Comments

Need for Implementation of the Full Metrorail Alternative

Federal Comment: Consequently EPA rates this project and the associated documentation with Lack of Objections with Adequate documentation (LO-1). We encourage the development of the full Metrorail alternative because with the highest ridership it will have the greatest capacity of moving people through the corridor and should have the greatest impact on reducing congestion and air pollution. The full Metrorail alternative will be a permanent alternative to the heavily congested roads in the Dulles Corridor and is supported by more businesses, residences and community groups than any other alternative. In addition, the full Metrorail alternative is on the MWCOG CLRP and has been found to conform to regional air quality plans. (0303, 0303-A –4)

Response: *Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative. The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative.*

Concern for Environmental Impacts of Yard Facilities

Federal Comment: We are concerned with the comparison of environmental impacts for the three rail yard sites. Site 15 appears to have the greatest environmental impacts. (0485, 0485 – A – 3)

Federal Comment: As you know from our meeting, held October 17, 2001, a rail yard sited on Dulles International Airport is not a desirable use of airport land. Rail yard site 15, one of three remaining alternatives, would be located on the airport. (0485, 0485 – A – 1)

Federal Comment: Concerned that constructing the Metrorail S&I Yard on Site 15 appears to have the greatest environmental impacts of the sites presented in the Draft EIS. States that a rail yard located on Dulles Airport property is not a desirable use of airport land. Concerned that the preferred alternatives may not pass legal muster under NEPA since there appears to be a practicable alternative rail yard site that meets the project purpose with less adverse environmental impact. (0485, 2-01)

> ***Response:*** *In December of 2001 and January of 2002, the Project Team, Metropolitan Washington Airports Authority (MWAA) and Loudoun County, in coordination with the Federal Aviation Administration (FAA), identified viable alternative sites for the Metrorail Service and Inspection (S&I) Yard. Yard Site 15 was determined to be viable for the following reasons:*
> - *The MWAA Land Use Plan does not indicate use of the site for any other purpose.*
> - *The yard's occupied structures of shop, operations, building and car wash are not within the runway approach surface of the future 19R runway, given the proposed runway separation of 4,000 feet. Most of the yard's surface tracks are outside the approach surface.*
> - *Across Route 606 from the yard site are established and newly constructed light industrial buildings, which will be within the runway approach surface of the future 19R runway.*
> - *The yard itself does not encroach in the floodplain of Horsepen Run and only impacts the edge of one wetland.*
> - *The outbound trains would have direct entry into the Yard Site in contrast to a reverse maneuver for yard Site 7.*
>
> *Since the FAA's initial review of the Draft EIS, the potential effects to wetlands, floodplains, and streams at Yard Site 15 have been minimized by reconfiguring its layout. In addition, potential effects to cultural resources have been eliminated.*

Federal Comment: The building associated with the S&I Yard is currently shown outside the approach zone to a proposed new runway, located 4,000 feet west of the existing Runway 1L/19R. However, there are several alternatives for the location of the new runway. If a new runway were to be constructed at some other separation distance from the existing runway, the design of the S&I Yard must respect the new approach, or MWAA must revise their policy. (0485, 2-02)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Yard Site 15 on Dulles Airport property as the Locally Preferred Alternative. The forthcoming FAA Draft EIS on the proposed improvements to the Dulles Airport has evaluated new north-south runways that are 4300 feet and 5000 feet west of the existing runway. These greater separation distances lessen the influence of the new north-south runway on S&I Yard Site 15.*

Need to Acquire FAA Land

Federal Comment: If it is determined through the EIS process that this site meets your operational needs and receives environmental approval, land will have to be acquired from the airport. The land on which Site 15 is located is dedicated airport property. The Metropolitan Washington Airports Authority (the Authority) is required to seek FAA approval for the release of any property dedicated for airport purposes as identified on the Exhibit "A" Property Map for the airport. Also, under the **Federal Revenue Diversion Policy,** FAA will be required to publish the intent to release this property in the Federal Register for 30 days to solicit public comments. The Authority would be required to obtain the fair market value in compensation for the property. (0485, 0485 – A –2)

> ***Response:*** *As indicated in Section 3.3 of the Final EIS, the Full LPA requires the acquisition of property interest in the median and other parts of the Dulles International Airport Access Highway and Dulles Connector Road, and in parts of the Dulles Airport property itself, including the site of the S&I Yard and portions of eight parcels that are currently leased to commercial entities. The U.S. Department of Transportation (USDOT) owns the Access Highway, Connector Road and Dulles Airport property. MWAA has leased the property from the USDOT through the year 2067 and has sublet certain commercial parcels to businesses. DRPT will seek*

conveyance of the Access Highway, Connector Road and Airport property interest needed for the Project from the USDOT and MWAA. The acquired property interests will be adequate to assure DRPT's or WMATA's continuing control of the project property throughout the useful life of the project. In addition, purchase of land for an S&I Yard at fair market value was factored into the capital costs presented in Chapter 8 of the Final EIS.

Need to Avoid Impacts of Parking Facilities on Station Area Development

Federal Comment: Park-and-ride facilities should not interfere with development of the station areas, particularly within the ¼ mile radius. This area is better suited to pedestrian-scale development patterns. If parking facilities are located in these areas, they should be located underground. (0492 01)

Response: *Stations need to accommodate multiple arrival modes, including pedestrian, bicycle, feeder bus, private shuttles, and private autos. Each is important in building and maintaining ridership, and availability of daily parking is particularly influential in attracting choice riders – those who have a car available for a trip but choose to use transit. Providing such parking within a reasonable distance of the station does not preclude transit-oriented station-area development. Mixed-use, pedestrian-oriented, compact development can be integrated with parking areas. WMATA design criteria establish the maximum acceptable distance between the most remote station park-and-ride facilities and the station entrance to be 1,500 feet. Locating the station parking more remote than this would need to be weighed against negative impact on patronage.*

As stated on Chapter 5 of the Draft EIS, parking is a potential element of joint development opportunities in the Town of Herndon, and the Wiehle Avenue Station. Other parking facilities may be provided through the proffer system or as incorporated into private development proposals. The park-and-ride facilities that are currently under development or proposed for the corridor have been assessed for ridership effects in the Final EIS. The actual location and implementation of remote station parking would be under the control of the local government, which implement parking requirements as part of their local land use regulations.

State Agency Comments

Need to Implement Build Alternatives to Gain Air Quality Benefits

State Comment: The Commonwealth of Virginia has no objection to any of the "build" alternatives. It appears to us that any of the "build" alternatives would be preferable to the no-action alternative, given the widely acknowledged beneficial air quality impacts of improved mass transit, particularly in the Northern Virginia ozone non-attainment area. (0407, 0407-A –1)

Response*: The two Build Alternatives of the Final EIS are intended to address the deficiencies of the existing highway and transit systems in the Dulles Corridor and the future transportation needs of the growing number of residents, employees, and visitors in the corridor and region. A No-Build Alternative is required by the regulations that governed preparation of the Final EIS. The No-Build Alternative serves as the basis for comparison and evaluation of the two Build Alternatives.*

Note that the two Build Alternatives will result in pollutant levels that are similar to those expected for the No-Build Alternative. The difference between alternatives was negligible. All predicted pollutant levels are below those allowed under federal air quality standards. In addition, the two Build Alternatives are expected to have similar effects on air quality. All alternatives will have reduced levels of carbon monoxide emissions compared to existing conditions. This anticipated reduction is primarily attributable to improvements in vehicle emission rates over the next 25 years.

Need for Maintenance Yard Alternatives

State Comment: We are pleased with your efforts to find an alternative location for the rail operating and maintenance yard facility. We support the use of the site south of the station on Route 606 on Washington Dulles International Airport. (0131, 0434-E –4)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner and with Yard Site Y15 on Airport property as the Locally Preferred Alternative.*

Need for Bus Service Improvements

State Comment: While the bus rapid transit alternative described in the Draft EIS has a number of serious limitations, we think that there can and should be significant improvements to express bus service and passenger amenities in the interim, including the use of technology to enable prepayment before boarding, real time information about the location of buses, and more neighborhood and circular services. (0131, 0131-T –8)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner and with Yard Site Y15 on Airport property as the Locally Preferred Alternative (LPA). The LPA will be constructed in two phases, the first being the Wiehle Avenue Extension.*
>
> *For the Wiehle Avenue Extension, corridor express bus service, formerly referred to as 'premium bus', will be a feeder system for the interim end-of-line Wiehle Avenue Station. It will be a high quality service meant to replicate rail service to the greatest degree possible until rail is extended to Loudoun County in the second phase of the project. The service would mimic rail in terms of service to station areas served by rail (Route 772, Route 606, Dulles Airport, Herndon-Monroe, Reston Town Center, and Wiehle Avenue) service frequency, hours of service, and the fact that there would be high quality service in the reverse peak direction. The Corridor express bus service will not replace express service currently run by Loudoun County into Rosslyn and downtown Washington.*

Funding Implications of Roadway Improvements at Route 772 Station

State Comment: Site Plans for the Route 772 Stop indicate North and South of Dulles Greenway alternatives with Proposed Transit Connector Roads to be constructed by other . There is considerable cost in these roadway improvements particularly the bridge crossing Dulles Green Way. The agency charged with building these roads would need to program and fund these commitments and look at the cost verse area of service/ease of service vs. roadway network serviceability. For example the North Station Facility option could connect to Route 643 with traffic routing to Route 772 interchange avoiding the expensive bridge crossing of Dulles Greenway. This would also effect development/access to the areas of stations. (0421, 0421-A –23)

> ***Response:*** *As indicated in the General Plans (Final EIS Volume V), construction of the proposed Dulles Greenway overpass is assumed to be by others. Although the Route 772 Station of the revised LPA includes station facilities on both sides of the Dulles Greenway, the Project has determined that transit-related use of this overpass would be limited. Other roadways shown are included in the phased implementation of adjacent developments as approved by Loudoun County. Station access will be the subject of continuing coordination with Loudoun County, property owners, and developers in station area.*

Reston Parkway Constructability Issues

State Comment: Reston Parkway Stop - Shows proposed underpass by others directly conflicting with station - By who? Is it part of regional network? Does this station preclude overhead crossing over of roadway? (0421, 0421-A –26)

> ***Response:*** *In the final General Plans, the proposed southside station facilities are configured to permit the eventual construction of the underpass (this would result in the loss of some interim short-term/Kiss & Ride parking, but pedestrian and vehicular access to the station would be maintained). The underpass is in the Fairfax County Transportation Master Plan. The station and facilities as currently planned do not preclude construction of this roadway as an overpass.*

Need for Adequate Horizontal Clearances

State Comment: Sheet 690 - Does pedestrian bridge have adequate clearance over the Herndon Monroe Park and Ride Ramp from Structure? (0421, 0421-A –25)

> ***Response:*** *As indicated in the Facilities General Plans (Final EIS Volume V, Sheet 054), the pedestrian bridge will provide 17'-0" clearance for the existing ramp below.*

Regional Agency Comments

Need for Enhanced Horizontal Circulation at Stations

Regional Comment: It would appear that the four-station alternatives T6 and T9 offer the most potential service to Tysons Corner. However, only a small fraction of the Tysons Corner area would be within walking distance of these stations. The final EIS needs to include the concept of moving sidewalks or some other form of mechanized outreach to bring a much higher proportion of Tysons Corner's residents and employees within convenient access of the four stations. (0133, 0405- L-8)

> ***Response:*** *A significant percentage of the Tysons Corner core area is within reasonable walking distance of the proposed stations. It is anticipated that employee shuttles will be provided by many of the major employers in Tysons Corner, in addition to Fairfax County's planned circulator bus routes, and other feeder bus routes that will serve the stations. Provision of moving sidewalks to extend the pedestrian reach from the stations would not be practical or cost effective.*
>
> *A fixed-guideway circulator system in Tysons Corner was studied as part of DRPT's Dulles Corridor Transportation Study (June 1997), a major investment study (MIS), and was requested again during the Scoping Process for the preparation of the Draft EIS. As part of the Draft EIS process, the Project Team reconsidered the circulator concept. The Project Team reviewed the findings of the MIS analysis and found the analysis to be valid. Therefore, a circulator was eliminated from further consideration and was not fully analyzed in the Draft EIS or in the Final EIS. The reasons for the elimination of this alternative are fully detailed in the Final Alternatives Analysis Report (May 2001).*

Opposition to BRT

Regional Comment: BRT, as envisaged in the DEIS, lacks the ability to trigger the higher densities around rail stations permitted in county plans. So the decision between rail and BRT will have a profound effect on the Corridor's evolution and thus upon our quality of life and the Commonwealth's revenues. (0133, 0221-M –7)

Regional Comment: The primary "demand times" within the Dulles Corridor are along the Corridor to Tysons Corner and secondly to the inner core. BRT cannot, as discussed, effectively serve the Tysons Corner flow. There also is a physical limit to the number of buses that can connect to trains at the West

Falls Church Metro Station in any given hour in order to serve the inner core flow. That limit, even using high capacity buses, is less than the projected demand after 2010. This limit was found by an analysis presented to the Dulles Corridor Task Force in 1998 by its Service Delivery Working Group. (0133, 0405-L-13)

Response: *The commenter's statements are correct. These were among the issues considered in selection of the Metrorail Extension as the LPA.*

Support Metrorail Alternative

Regional Comment: The [Washington Area] Task Force supports rail in the Dulles Corridor. (0132, 0132-T –1)

Regional Comment: We strongly recommend the Commonwealth Transportation Board select the rail option offering the greatest potential for ridership now and in the future. (0133, 0133-T –1)

Regional Comment: I think that the one-liner is very simple: Select rail; do it right; do it now. (0133, 0133-T –8)

Regional Comment: We strongly recommend that the Commonwealth Transportation Board select the rail option offering the greatest potential for ridership now and in the future. (0133, 0221-M –1)

Regional Comment: The Washington Airports Task Force recommends as the Locally Preferred Alternative the rail option that will serve the most people. Only rail to Route 772 in Loudoun County can, number one, provide the most convenient connection of Dulles airport to every part of the region served by Metro and, number two, open up the airport's rapidly growing employment base to all parts of the region. (0132, 0132-T –5)

Regional Comment: Commuters from the urban core and other parts of the region need to be able to reach jobs at Tysons Corner, in the corridor and at Washington Dulles. Commuters from the growing western perimeter of Washington need access to jobs in other parts of the metropolitan area, as well as in the Corridor and at Tysons Corner. And air travelers need to be able to reach Dulles Airport by transit from any part of the metropolitan area. For all of these reasons, the Washington Airports Task Force recommends, as the locally preferred alternative, the rail option that will serve the most people. Only rail to Rt. 772 can:

1. Provide the most convenient connection of Dulles Airport to every part of the region served by Metro and

2. Open up the airport's rapidly growing employment base to the District of Columbia and all parts of the region. (0132, 0222-M –2)

Response: *Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner and with Yard Site Y15 on Airport property as the Locally Preferred Alternative. The LPA will be constructed in two phases, the first being the Wiehle Avenue Extension.*

Suggested Alignment Modification

Regional Comment: The western portal at station 168+00 blocks ingress/egress to the Dulles Marriott Hotel and to Navigation Road at 1685+50. Consideration should be given to either relocating the portal further north or relocating Navigation Road and the Marriott access. (0440, 0440-A –12)

Response: *With the Supplemental Draft EIS and revised General Plans (October 2003) the Project Team relocated northward the portal at the western end of the Dulles Airport tunnel so that the Project's effects on the Dulles Airport Marriott have been lessened. This relocation is part of the Full LPA and final General Plans.*

Opposition to BRT Alternative

Regional Comment: The BRT concept is not practical within Tysons Corner, as dedicated lanes would not be available. That is a serious deficiency as approximately 65% of Tysons Corner's commuters come down the corridor from the west and only 14% come from the east. Both figures were presented to the Dulles Corridor Task Force in 1998 by its Service Delivery Working Group. The 1996 MIS supports this conclusion. Therefore, if the proposed transit system is to be cost effective, it must:

a) Provide attractive, practical service to a very large part of Tysons Corner;
b) Provide such service from the west, not just from the east.

Options that rely upon BRT for service west of Tysons Corner are not likely to be cost effective, as they would not provide a direct link with the corridor destinations that generate most of Tyson Corner's traffic. (0133, 0405- L-7)

Regional Comment: Dulles continues to grow as a major international airport and the Airports Authority has not wavered in its vision to have a rail connection to the Nation's Capital. As part of that vision the Airports Authority supports the Draft Environmental Impact Statement alternatives that utilize the median of the DIAAH for rail, including phased implementation that provides for rail on a reasonable, predictable schedule. The Airports Authority recognizes that BRT could well be a part of such a phasing strategy. We do not, however, believe that BRT has the capacity to meet the long term needs of the region and the future growth of Dulles, and thus do not support it as a long-term solution to the corridor's transit needs. (0440, 0440-A –1)

Response: *Comments noted. Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative. The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT and the BRT/Metrorail Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Need to Convert Existing Service to BRT

Regional Comment: We believe the current express buses in the Dulles Corridor, by running in lanes largely free of congestion, already are using the key feature of Bus Rapid Transit. It would take little effort to turn these services into true BRT without the delays and cost incurred in creating stops for them in the corridor. If executed quickly such an enhancement would be a valuable addition until rail can be completed through the Corridor to Loudoun County in 2010 or earlier. (0133, 0221-M –6)

Regional Comment: The current express buses in the Dulles corridor, because they ran in lanes largely free of congestion, already are using the key features of bus rapid transit. In fact, I think we see BRT as standing as build rail today. We believe it would take little effort to turn these services into true BRT without the cost incurred in creating stops for them in the corridor. Lastly, BRT lacks the ability to trigger the higher densities around rail stations permitted in county plans. (0133, 0133-T –6)

Response: *The Wiehle Avenue Extension will provide Metrorail service from the existing Orange Line through Tysons Corner, with interim express bus service between Wiehle Avenue and transit centers/stops in the western corridor, providing a level of service meant to closely replicate Metrorail service. Five routes or route families will provide service at frequencies comparable to Metrorail headways to transit centers/stops at Wiehle Avenue, Reston Town Center Transit*

Center, Herndon-Monroe Park-and-Ride, Dulles Airport, Dulles North Transit Center (Route 606), and Route 772.

Local Agency Comments

Support for Metrorail as Preferred Alternative

Local Comment: On August 13, 2002, the Town Council of the Town of Herndon unanimously passed the attached resolution recommending the "Metrorail Alternative" as the Locally Preferred Alternative (LPA) to be forwarded to the Virginia Department of Rail and Public Transportation (VDRPT), the Washington Metropolitan Area Transportation Authority (WMATA), and the Commonwealth Transportation Board (CTB). (0409, 0409-L –1)

Local Comment: As Hunter Mill District Supervisor, the following not only reflects my view but is also input gathered from numerous community venues. In general, there is as a consensus of support for rail now as the Local Preferred Alternative. While there are those that fear the outcome of rail may be detrimental to the community, I believe that the rail alternative over the BRT or No Build alternatives is critical to maintaining the quality of life and the economic stability of the surrounding communities in the Dulles Corridor. (0437, 0437-E –4)

Local Comment: The road network in Tysons Corner is at its limit. Important improvements can and will be made, however. The solution to Tysons Corner, nonetheless, is not in road expansion. While there are some favorable characteristics of bus rapid transit, there are clearly some additional costs that are associated with that that, in my opinion, perhaps force us to reexamine going the all-rail-now alternative. Rail transportation will improve air quality, will contain sprawl by creating a magnet for cluster development around the stations, and will maximize convenience to those living, working and shopping in Tysons. (0130, 0130-T –5)

Local Comment: We are on the verge of making the long-awaited vision of rail service to Tysons on the way to Dulles a reality. The time to take bold steps to solve the transportation problems has arrived, Mr. Chairman. Fairfax County and the Washington, D.C. region cannot afford to wait any longer. (0130, 0130-T –8)

Local Comment: While bringing rail to Tysons Corner is my top priority, I believe it is imperative that transit ultimately be extended through the Dulles Corridor to Dulles Airport. Washington, D.C. is one of the only capital cities in the industrialized world whose international airport is not served by rail. Demand for a rail link to Dulles will only increase as travel volume is expected to grow to nearly 32 million passengers by 2010. The opening of the new air and space museum next year is expected to attract millions more to the airport area. Furthermore, the closure of National Airport for months in the wake of September 11th is a compelling reminder of the reliance this region has on Dulles and the inconvenience of its missing rail link. (0130, 0289-T –5)

Local Comment: While bringing rail to Tysons Corner is my top transportation priority as the supervisor for Providence District representing most of Tysons, I do not want to neglect the fact that I believe it is imperative that transit ultimately must be extended throughout Dulles Corridor as soon as possible. (0130, 0130-T –6)

Local Comment: Compliments the Project Team on their efforts and is pleased that Metrorail and Y15 were recommended for the Locally Preferred Alternative. (0491 2-01)

Response: *Comments noted. Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative. The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative.*

BRT, the BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.

Local Efforts to Support Parking Facilities at Route 772 Station

Local Comment: The Loudoun County Board of Supervisors would like to address the problem of parking at the Route 772 Station. The Board of Supervisors is currently in negotiations with developers and believe that they can get dedication of the land necessary, at no cost to the project, to accommodate parking garages on both sides of the station, connected by a pedestrian bridge. (0491 2-02)

Local Comment: The land (in the vicinity of the Route 772 Station) is currently being rezoned, however, a parking solution from the Board of Supervisors is foreseeable in the near future. The Board of Supervisors would like to see the facilities necessary to accommodate the necessary demand (3,300 spaces) incorporated into the project costs. This parking area would be in addition to the parking already proposed for the Route 606 Station. (0491 2-03)

Response: *As evaluated in the Supplemental Draft as a revision to the selected LPA and further documented in the Final EIS and final General Plans, the Project Team in cooperation with Loudoun County reconfigured the park-and-ride program in Loudoun County. Route 772 Station increased from no park-and-ride facility to two structures of 3,300 spaces combined. Route 606 Station decreased from 4,750 spaces to 2,750 spaces.*

Need to Resolve T9 Design Conflicts

Local Comment: The public hearing report should include a determination as to whether the conflicts between the T9 Alignment and T9 Alignment design option and the potential I495/Route 123, Route 123/International Drive and Route 123/Route 7 interchanges can be resolved. (0479, 0479-L –2)

Response: *The T9 Design Option had been developed to significantly resolve the majority of conflicts posed by T9 at the crossing of the future I495/Route 123, Route 123/International Drive and Route 123/Route 7 interchanges. However, both the T9 Alignment, and the T9 Design Option Alignment were eliminated from further consideration after public and interagency review and comment on the Draft EIS.*

Need to Consider Secondary Impacts

Local Comment: The draft environmental impact statement has laid out several very viable alternatives. Close attention must be paid, however, to the potential impact on surrounding developments, especially residential development. And with that in mind, Mr. Chairman, while I think a loop may have some merit, I could not support an aerial loop running in Tysons. Its impact on existing residential development would be negative. (0130, 0130-T –4)

Response: *The T2, T5, T10, and T11 'loop' alignments were analyzed by the Project Team and eliminated from further consideration during Intermediate and Final Screening for a variety of reasons. The screening analysis and results are detailed in the Final Alternatives Analysis Report (May 2001). Alignment T4, the loop alignment that was advanced to the Draft EIS, was eliminated from further consideration after public and interagency review and comment on the Draft EIS.*

Support for Yard 15 Facility

Local Comment: With respect to the rail yard options, we are opposed to yard site 7 and 20 and favor yard site 15. Site 15 meets all of the Washington Metropolitan Area Transit Authority requirements and allows sites 7 and 20 to be developed as envisioned in the county's comprehensive plan. In time, these properties will contribute to the WMATA customer base. (0240, 0240-T –4)

Response: *Yard Site 15 was selected for the LPA after the public and interagency review and comment on the Draft EIS.*

Opposition to BRT

Local Comment: A savings in both time and funding that could be achieved on this project is the elimination of the bus rapid transit phase and going directly to rail. While BRT initially may have had certain advantages, such as a favorable Federal funding ratio, this is no longer the case. To include BRT may also have the added disadvantages of increasing the project's overall cost and, perhaps most importantly, it would present significant operational problems if you were to build the rail line while keeping BRT operational. Frankly, we do not see the cost justification and operational advantages for building BRT over maintaining or enhancing bus services that Loudoun County and others currently operate in the Dulles corridor. (0240, 0240-T –3)

Response: BRT *Alternatives were eliminated from further consideration after public and interagency review and comment on the Draft EIS.*

Herndon-Monroe Station Design Consideration

Local Comment: The Town Council views the near-term implementation of rapid transit in the Dulles Corridor as imperative. The Town Council is in full support of the effort to bring Metrorail to the Dulles Corridor due to the capacity limitations of Bus Rapid Transit and the disruption issues associated with phased implementation. During the past few years, we have been looking closely at the important Herndon-Monroe Station proposal and how to best develop pedestrian and vehicular access to the station from the Town of Herndon. This effort resulted in the Town completing an engineering concept and feasibility study in cooperation with VDRPT as well as other project sponsors. (0409, 0409-L –2)

Local Comment: On June 12, 2001, the Town Council unanimously passed a resolution recommending a preferred alternative for direct access from the Town to the future Herndon-Monroe Transit Station. The Town's selected alternative is referred to as Alternative #4 and, as stated in the attached resolution, it is the preferred configuration to be explored in more detail with Virginia Department of Rail and Public Transportation. This alternative emphasizes a pedestrian walkway extending from the station to the north, directly into Herndon, with a modal transfer point for persons arriving by bus, car-pool, van-pool, automobile and bicycle. The Town Council believes that enhanced pedestrian and vehicular access on the north side should be a part of the station development scheme from the beginning. Effective north side access to the station will have beneficial impact on Town property values and the quality of life of residents and person working in the Town, over the long term, especially if appropriate redevelopment of the transit station area is implemented during the coming years. (0409, 0409-L –3)

Local Comment: The [Herndon] Town Council requests that the Herndon-Monroe Station construction include necessary facilities for inter-modal transfers and adequate pedestrian facilities on the north-side of the station, and that such facilities be incorporated into the final Environmental Impact Statement for the Dulles Corridor Rapid Transit Project. (0409, 0409-L –4)

Response: *As indicated in the General Plans (Final EIS Volume V), the Project would provide a north side entrance pavilion and pedestrian walkway to Herndon Parkway. The configuration of these elements will be the subject of continuing coordination with Fairfax County, the Town of Herndon, and adjacent landowners and developers. As acknowledged in the Town's letter of April 2, 2002, the Project Team does not plan to construct the intermodal facility cited in these comments. If this facility is advanced by others, the Project Team will coordinate its design with the proponent(s) to the extent feasible.*

Need for Linkage Between Stations and Regional Bike/Pedestrian Connections

Local Comment: Provide increased pedestrian/cycle access to the transit stations of Wiehle Avenue, Reston Parkway and Tysons Corner and particularly as a means of allowing for reconnecting the north-south Reston communities. (0437, 0437-E –9)

> ***Response****: DRPT is the Project's sponsor and initial owner. However, the responsibility for modifications of sidewalks and trails as part of station access is with Fairfax County, Loudoun County, Town of Herndon, City of Falls Church and VDOT. DRPT will, though, coordinate with these jurisdictions and agencies during preliminary engineering and final design to determine the improvements for station access beyond the station site plans, as well as their ownership and maintenance. Close communication would also occur with the Fairfax County Non-Motorized Transportation Committee, private landowners and developers and other stakeholders. The Fairfax Countywide Trails Plan and the Loudoun County Trails plan have been and will be consulted. Comprehensive pedestrian circulation beyond the station site plans may be implemented in conjunction with other planned developments, County, and/or State projects and/or as elements of the Fairfax Countywide Trails Plan and the Loudoun County Trails plan.*

Need to Address Potential Parking Overflow Effects at East/West Falls Church

Local Comment: The draft EIS has failed to adequately address issues of parking overflow in the residential areas adjacent to the East and West Falls Church Metro Stations. (0122, 0122-A –3) (0122, 0164-T –4)

Local Comment: In addition, new parking facilities may be needed at either metro station to support ridership. If these motorists drive to the stations and cannot find parking, they will try to park on the residential streets, creating a significant impact on the surrounding neighborhoods. The City [of Falls Church] has repeatedly requested that these impacts, and others, be anticipated and addressed. (0122, 0122-A –9)

Local Comment: Parking - The pressure for Metro parking on the City's [Falls Church] residential streets is extreme at present. We are finding that permit parking or time restrictions simply moves the parking further out into other City neighborhoods impacting more and more residents constantly. Assumptions - The assumption that parking needs will not increase is flawed. The recently announced potential addition of 1,000 parking spaces at the West Falls Church Metro area clearly indicated parking needs are greater than stated in the report. (0122, 0122-A –18)

Local Comment: Impacts - Parking studies are needed for both the East and West Falls Church Metro areas. (0122, 0122-A –19)

Local Comment: Equity - The City and its environs have more residential streets impacted than any other locality, but no consideration was given to how parking will be handled on those streets. (0122, 0122-A –20)

> ***Response*****:** *Based on the analysis of the forecast traffic volumes for the East and West Falls Church Metrorail Stations, the Project Team does not feel that overflow parking onto residential streets will be a problem. Moreover, since completion of the Draft EIS analysis, WMATA has programmed a 960-space parking facility at West Falls Church to be completed in late 2005. Impacts on project analysis resulting from this facility are discussed in the Final EIS. The Project Team also initiated meetings with the City of Falls Church to discuss the issues of overflow parking and cut-through traffic.*

Effects of Park-and-Ride Facilities on Traffic Flow at Tysons West Station

Local Comment: I am writing to raise concerns that I have regarding the designs of the future rail stations in Tysons Corner. I understand that when Metro is extended to and through Tysons Corner there

will be a need for commuter parking. In the interim, before Metro is extended from Tysons to Dulles, there will also be a need for a terminus station with ample parking. While I support parking facilities at Tysons West I am deeply concerned that the existing DRPT / WMATA design proposal for the interim terminus station in Tysons Corner, that includes a 2,000 space parking garage on Leesburg Pike, would catastrophically effect traffic flow on Route 7 resulting in gridlock affecting most of Tysons Corner. (0130, 0308-L –1)

Local Comment: Mitigation measures should be examined to further handle the impacts of the proposed parking facility in the northeast quadrant of Route 7 and Tyco Road. (0479, 0479-L –3)

> ***Response*:** *In response to public and interagency review and comment on the Draft EIS, the capacity of the park-and-ride structure at the Tysons West Station was reduced from 2,000 to 500 spaces. Further, the peak activity at the station will be early on weekday mornings and the park-and-ride structure will likely be full before the local peak hour of Tysons Corner. For instance, the final park-and-ride customers of Metrorail would arrive before 7:30 a.m., while the local peak hour would be between 7:30 a.m. and 8:30 a.m.*

Station Location Incompatibility

Local Comment: The Wilmorite representatives suggested that the proposed location of the bus transit station along the private, internal ring road of the Center is incompatible with the existing circulation patterns and development of that portion of the Center. With the narrow internal roadways and tight turns along the Center's ring road, the Wilmorite representatives were concerned about potential conflicts between buses and passenger vehicles, as well as the potential burden the new bus circulation could place on the Center's internal road network. As you are aware, the Center is consistently busy, with many customers and employees accessing the site from Route 123 (especially during the busy holiday seasons) so the ingress/egress and circulation around the Center is extremely important. I have seen firsthand how difficult it is to navigate the roads around Lord & Taylor and Circuit City, where the station is proposed. Given the potential adverse effects of the bus transfer station, I request that you and the design team review the concerns above and reexamine the suggested location and configuration of the proposed station to see if a more appropriate location for this facility would better facilitate transit-oriented development in Tysons Corner. (0130, 0439-L –1)

> ***Response:*** *The proposed entrance pavilions and other station facilities at the Tysons Central 123 Station are important to the success of the project. In response to public and interagency review and comment on the Draft EIS, the intermodal facilities of the Tysons Central 123 Station have been reconfigured. As indicated in the General Plans (Final EIS Volume V), the south side bus bays have been relocated and reduced in quantity, and bus bays are now also provided at the north side. During preliminary engineering, DRPT and WMATA will continue to work with Fairfax County, VDOT, affected property owners and developers to coordinate integration of the station facilities with existing and proposed development. Any integration of the intermodal facilities with a proposed development will be subject to review by Fairfax County through its zoning and comprehensive planning procedures.*

Public Comments

Support for Metrorail as Preferred Alternative

Public Comment: Fairfax Coalition for Smarter Growth applauds the decision to emphasize mass transit, especially some form of rail, as the key to transportation in the Dulles corridor. (0151, 0151-T –1)

Public Comment: The Fairfax Coalition for Smarter Growth applauds the decision to emphasize mass transit-- specifically, some form of rail-- as the key to transportation in the Dulles Corridor. (0151, 0297-E –1)

Public Comment: As one member of the Board of Supervisors, I find that the analysis and evaluation provided in the DEIS reaffirms the conclusions of the MIS which recommended a seamless rail extension in this corridor. Such a rail extension is the only option that provides sufficient throughput capacity in the corridor to meet existing and future corridor travel demands, particularly in the Tysons area. The Tyson's area represents the largest employment center in the region and deserves to be connected via rail with the rest of the region. In addition, rail service to Dulles International Airport is essential towards serving the demand associated with continued growth in air traffic as well as serving commuter needs in the Renton/Herndon area. Finally, a rail extension is also consistent with and will support the County's comprehensive plans, which have long recognized the provision of rail. (0151, 0270-L –1)

> ***Response:*** *Comments noted. Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative. The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT, the BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Opposition to BRT

Public Comment: Finally, the Fairfax Coalition believes that the BRT should be dropped as an interim step towards rail. The existing express bus service in the corridor is doing a better job than BRT would, and we can provide you the figures if you like. Throughout the U.S., busways have either failed or fallen short of projected riders. BRT costs more than light rail to build, slows travel, and adds transfers for most people, creates more air pollution and noise than rail, has a higher cost of operation than rail, has 80 percent more injuries than rail (0151, 0151-T –9)

Public Comment: Finally, the Fairfax Coalition believes that the Bus Rapid Transit should be dropped as an interim step toward rail. The existing express bus service in the corridor is doing a better job than BRT would. And we can provide the figures if you like. (0151, 0297-E –14)

> ***Response: BRT*** *Alternatives were eliminated from further consideration after public and interagency review and comment on the Draft EIS.*

Herndon-Monroe Station Design Consideration

Public Comment: Will the areas around the stations be pedestrian-friendly? (0151, 0297-E –10)

> ***Response*****:** *DRPT is the Project's sponsor and initial owner. However, the responsibility for modifications of sidewalks and trails as part of station access is with Fairfax County, Loudoun County, Town of Herndon, City of Falls Church and VDOT. DRPT will, though, coordinate with these jurisdictions and agencies during preliminary engineering and final design to determine the improvements for station access beyond the station site plans, as well as their ownership and maintenance. Close communication would also occur with the Fairfax County Non-Motorized Transportation Committee, private landowners and developers and other stakeholders. The Fairfax Countywide Trails Plan and the Loudoun County Trails plan have been and will be consulted. Comprehensive pedestrian circulation beyond the station site plans may be implemented in conjunction with other planned developments, County, and/or State projects and/or as elements of the Fairfax Countywide Trails Plan and the Loudoun County Trails plan.*

Need to Enhance Alternative Information

Public Comment: Description of the Alternatives: The description of the Build Alternatives in the draft environmental impact statement (EIS) does not adequately describe all of the components of the complete transportation system that must be put in place. The EIS only describes the core BRT, rail, or BRT/rail infrastructure component of each transportation system. The description of the system

components for passenger access to stations is completely inadequate. The EIS should be revised to describe completely all components of the transportation system proposed under each alternative, including the integral components for passenger access to stations by walking, bicycle, feeder bus, and automobile. (0392, 0392-L –7)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

As noted in Chapter 2 of the Final EIS, the local feeder and corridor express bus network for the two Build Alternatives will involve modifications to the existing bus network in the corridor. The modifications are described in detail in the Transit Operations and Maintenance Plan (2004). In the report, the bus network for the No-Build Alternative is described, including service route names, operator, type of service, days of operation, routing and terminal points, and service frequencies during the peak and off-peak-periods.

Chapters 2 and 6 identify the existing and proposed park-and-ride and Kiss & Ride facilities that would allow for automobile access to the proposed rapid transit improvements. More detail for these facilities is included in the Facilities General Plans (Volume V). Chapter 6 also states that the project is not expected to affect existing and planned pedestrian and bicycle facilities in the corridor.

DRPT is the Project's sponsor and initial owner. However, the responsibility for modifications of sidewalks and trails as part of station access is with Fairfax County, Loudoun County, Town of Herndon, City of Falls Church and VDOT. DRPT will, though, coordinate with these jurisdictions and agencies during preliminary engineering and final design to determine the improvements for station access beyond the station site plans, as well as their ownership and maintenance.

Limitations of the No Build

Public Comment: The DEIS considers a "No-Build" alternative for base line comparison. This alternative cannot work. It will gridlock. Great population, employment and traffic growth is forecast. Air quality fails to meet legal requirements. Property and money is not available to simply expand the existing system as it is but if it were, it would not help much. It would not be a good or useful investment. (0013, 0013-L –13)

Public Comment: Excellent bus service is now provided on the Dulles Toll Road #267 from West Falls Church MetroRail station to Reston and Herndon, but the bus service has several inherent disabilities that only MetroRail can correct. The bus service cannot adequately serve the 100,000 jobs in Tyson's Corner because of inherent traffic and highway patterns. Tyson's Corner has several bus routes but they are poorly patronized because of their inherent disabilities. (0013, 0013-L –5)

Public Comment: The "Baseline" or no-build option simply does not make sense. The population growth of the area west of Falls Church, and the employment base that drives it, will place a demand upon the Dulles transportation corridor that simply cannot be met by the highway and bus system upon which we have relied in the past. We will certainly need more and improved roadways and bus routes than we have today, but ultimately they simply will not be enough. We need a dramatically upgraded transit system in this corridor. (0088, 0211-M –2)

Public Comment: The Baseline Alternative, or "no build" option, would strangle Dulles Airport. Highly effective ground transportation is an essential part of any airport development equation. Even with the extreme reduction in flights following 9/11, the most recent projections for flight activity at Dulles substantially exceed the projections anticipated just a year ago. Such an increase in air traffic will inevitably create a corresponding increase in ground traffic. Since there is a very real limit to the number of highway lanes that can be built within the Dulles Corridor without extreme right of way acquisition

challenges, a highway only option would severely restrict passenger and freight access to the airport. (0204, 0204-M –2)

Public Comment: We studied the alternatives presented in the Draft EIS. The no-build alternative would strangle Dulles airport. We already have one of the worst traffic problems in the United States, and if it gets much worse, the businesses that made this region so strong will leave. (0204, 0247-T –1)

Public Comment: Traffic Systems Management has already been applied, with HOV lanes, car pool promotion, free bus service, expanded bus service, flexible work hours, telecommuting, better information systems, SmarTrip fare cards and Travel Management Associations. All have helped, but not nearly enough. They just do not have the necessary capacity or travel speed in congestion. (0013, 0013-L –14)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative.*

Public Comment: How does your plan compare to doing nothing if you include changes in behavior? In a sense what I have heard here tonight is that you assume that you need to increase the throughput, okay. On page S-23 of the EIS, it dismisses the possibility of doing nothing because it does not include changes in behavior, whereas doing nothing may encourage businesses to decentralize and move out to where the people are, or people to move in to where the businesses are and end up with a more cost-effective and environmentally beneficial system. (0166, 0166-T –6)

> ***Response:*** *The population and employment projections as well as the regional trends in land use presented in Chapters 3 and 5 of the Final EIS as well as the historical trends in development in the region do not support such a claim.*

Public Comment: The No Build alternative did not consider the application of commonly used, low-cost methods such as information systems at bus stops, posted schedules, and the construction of bus shelters. Accordingly, the projection for new riders was inflated. (0162, 2-01)

> ***Response:*** *The No-Build Alternative includes all existing highway and transit infrastructure and services within the corridor, and any that are committed to be implemented by 2025, aside from the Dulles Corridor Rapid Transit Project.*
>
> *The need for shelter improvements and better provision of information throughout the regional bus system (including bus transit in the Dulles Corridor) has been examined as part of WMATA's Regional Bus Study. This study is a comprehensive examination of existing bus service throughout the entire Washington metropolitan region. This study focuses on transit services provided by numerous jurisdictions, including Fairfax and Loudoun counties. The objective of the study is to identify a comprehensive bus service plan to meet future needs for the region, as well as associated facility improvements. These improvements could include physical or technological improvements that facilitate bus operations in congested environments. Potential traffic signalization changes to improve transit mobility/reliability are among the elements being evaluated. Findings can be found at http://www.wmata.com/about/expansion/bus_study.cfm.)*

BRT Vehicle Concerns

Public Comment: Doors could be cut into the left side of buses but this would reduce both seating and strength of the bus structure. Such a bus design would have to be tested at the Altoona Bus laboratory before being accepted. New bus designs do not work well until "shaken down". When General Motors first expanded their 35-foot standard bus to forty (40) feet, the first such buses cracked across the roof at the center doors. When the Urban Mass Transportation Administration tried to develop a new bus design, two of the five prototypes burned up. No one in the world would agree to manufacture the design. When MetroBus bought the first order of AM General buses about 1975, several of them burned up. The balance of the fleet wore out rapidly. We must not get into such situations. (0013, 0013-L –19)

***Response**: The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Under the BRT, BRT/Metrorail, or Phased Implementation alternatives, the proposed General Plans (June 2002) allowed for either conventional (right-) or left- door vehicle configuration. The Project Team was aware of and would have conformed to federal requirements for bus vehicle testing. The 60-foot articulated, low-floor, diesel powered vehicles that were under consideration would have been available from several manufacturers and in use at transit properties nationwide.

Need to Visit Existing BRT Systems

Public Comment: We request that the team study personally and visit places where bus rapid transit is in operation. The FAA knows where these places are, Miami, Honolulu, Hartford, Vancouver, Ottawa, Lima, and Bogotá. (0184, 0184-T –9)

Public Comment: We request that the study team personally visit places where Bus Rapid Transit is in operation to learn from their experiences, and review the current EIS with officials from the Federal Transit Administration who know the successful results from projects they have been involved in this country, such as in Miami, Honolulu, and Hartford, and in Canada, in Vancouver and Ottawa, and in Latin America, Lima, Curitiba, and Bogotá. (0162, 0162-T –12)

***Response:** The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Members of the Project Team both visited many of the places where BRT systems are currently used and did have extensive experience studying, designing, and implementing BRT systems throughout the world.

In addition, the Draft EIS was prepared on behalf of the Federal Transit Administration by the Project Team, and was reviewed and approved by this federal agency prior to its circulation for public review and comment.

Need for Additional BRT Support Facilities

Public Comment: Identification of Benefits of Additional BRT Stations/Parking Garages. Much of the ridership difference, particularly in the earlier years, between BRT and rail is that BRT has only one Tysons station and no parking garage. What BRT ridership increases would be achieved by adding a Route 123 or Tysons West BRT station and a parking garage? (0446, 0446-E -6)

Public Comment: States that consulting with VDOT on how to fit a bus lane into Tysons Corner could have developed into another alternative. (0255, 2-03)

***Response:** The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

During scoping and early public meetings, no party suggested an alternative with three BRT stations in the median of the DIAAH and in the locale of Tysons Corner, as the comment describes.

Providing the same BRT level of service in Tysons Corner as Metrorail would have reduced the cost and timing advantages associated with the BRT Alternative of the Draft EIS. Operating the BRT service on congested roadways in Tysons Corner to provide more direct connections to destinations would have increased travel times and offered little benefit over driving. Such a system would not have been an attractive travel alternative, and would not likely attract high ridership. However, Fairfax County and VDOT would have been unlikely to dedicate a lane for exclusive bus use, given that many roadways in Tysons Corner are expected to operate at or above capacity in the future, even after implementing capacity increases (see Chapter 6 in the Draft EIS).

Therefore, the only way to provide the same level of service and directness would have been to operate BRT on a grade-separated route through Tysons Corner. Both an elevated route and an underground route would have added considerable expense and construction time to the project, thereby diminishing two of the primary advantages of BRT in the Dulles Corridor. An elevated roadway would also have had the same degree of visual impacts as an elevated Metrorail alignment. Because a grade-separated alignment for BRT through Tysons Corner would have increased the cost, construction time, and impacts of the alternative, this was not considered an advantageous configuration for the BRT Alternative, especially given that it would still have required a transfer at West Falls Church, reducing overall ridership as compared to the Metrorail Alternative.

Given the forced transfer at West Falls Church, it would also not have been cost-effective to have a BRT station in Tysons Corner with a park-and-ride facility. Few travelers would have drove on congested roadways to access the BRT line in Tysons Corner, only to transfer to Metrorail a short time later. Rather, most travelers would have drove directly to Metrorail at existing park-and-ride facilities along the western end of the Orange Line.

BRT Access Ramp

Public Comment: They do think that there are some concerns with the way the BRT ramp comes looping from the Dulles airport access road and is accessing that garage structure. (0161, 0161-T –2)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS. Under the BRT/Metrorail and Phased Implementation alternatives, this ramp would have been needed to provide dedicated access for BRT vehicles between the DIAAH and the Tysons West Station.*

Equivalent Service to Metrorail

Public Comment: Questions whether the proposed BRT Alternative could actually provide equivalent service to that of Metrorail, especially in terms of frequency and service. (0157, 2-01)

Response*: The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Metrorail will provide an hourly passenger carrying capacity of 8,640 passengers during the peak period. This carrying capacity is based on 9 trains in the corridor per hour, with 8 cars per train, and a capacity of 120 passengers per car.

In order to provide this same capacity, 141 BRT buses would have to be run per hour, meaning a bus running approximately every 23 seconds. This calculation is based on a BRT vehicle capacity

of 61 passengers. Running buses at this frequency would be extremely difficult, if not impossible due to:

- *The extreme difficulty of adding enough bus bays at West Falls Church station (space constraints, cost, potential environmental impacts) to handle this number of buses; and*
- *Operational difficulties in the median of the Dulles International Airport Access Highway, including bus backups in the median and significant delays for buses being forced to wait in order to stop at stations/stops until buses in front of them pull out.*

Support for BRT Alternative

Public Comment: As another acceptable option, I would go for BRT if we can't afford Metrorail - which it appears we cannot, without taxing everyone to death. (0030, 0030-CC-3)

Public Comment: I don't see a lot of utility in building BRT as an interim measure- it should be an end in itself. (0076, 0076-CC-2)

Public Comment: BRT is cost effective- use it. (0038, 0038-CC-4)

Public Comment: Gosh, I almost forgot! There is a better way for this to happen. It's called Bus Rapid Transit. It is cheaper to build, cheaper to maintain and easier to implement (right now). And despite what someone said in the Ashburn session, it is not a demeaning way to travel…if all of the pieces are in place. Remember I said find a bus route sign, find a bus shelter, find a bus schedule!!! If you can't ---YES that is demeaning. But if done right it is a great, more flexible way to go. (0233, 0426-M –23)

Public Comment: Choosing an option [BRT] that only cost 10% of rail seems to be a no-brainer. With operating costs at 1/5 of metro rail's we have another no-brainer. We could put in 5 of these systems and serve other areas desperately in need of transit (I.e. Rt. 66 from Vienna to Manassas). (0294, 0294-E –2)

Public Comment: We believe BRT is an alternative that is far more cost-effective, flexible and quick in operation than metrorail. We have found many web sites showcasing successful examples of BRT, both in the U.S. and in other countries, where the system is performing far better than the EIS indicates it will. These web sites are posted on our web site, www.moveit.org, and most of them are also on the Federal Transit Administration's web site. (0138, 0138-T –1)

Public Comment: I strongly urge the Commonwealth of Virginia to reject the rail transit proposals as presented here tonight and support bus rapid transit (BRT) instead. (0112, 0269-M –1)

Public Comment: We support the BRT and not the rapid rail, for a number of reasons. (0252, 0252-T –1)

Public Comment: Utilizing buses instead of rail would be a better plan and less expensive in our opinion. (0267, 0267-L –2)

Public Comment: I attended the Dulles Rail hearing in Ashburn and I listened to the proposals. I came to the conclusion that BRT must be chosen as the locally preferred alternative. It is more flexible and so much less expensive. (0294, 0294-E –1)

Public Comment: The Dulles Corridor is ideally suited for BRT. Dedicated lanes EXIST. USE them!!! (0294, 0294-E –3)

Public Comment: It would only take 12 to 18 months to get a BRT system up and running in the Dulles Corridor. That would help solve community problems to and from Reston far sooner than metrorail could, at a fraction of the cost, and without the need to raise the tolls on the Dulles Toll Road. (0183, 0183-T –6)

Public Comment: Metro is planning to increase its fares and parking fees. That will actually drive away riders. Workers in our area should definitely consider and would definitely use an aggressively marketed BRT service. BRT would provide much-needed relief to those of us who travel in the Dulles Corridor. BRT is more flexible than the metrorail system. Once the $3.3 billion estimate for the project is spent for one rail line, more money has to be raised to meet the region's future needs after that. With BRT, a system can come up and running for far less money up front and more money would then be available to use for future projects as our region continues to evolve. And best of all, it would help solve our problems now and not 20 years from now. (0183, 0183-T –8)

Public Comment: We support construction of a high quality bus rapid transit (BRT) system which would mitigate these funding and design issues and would bring transit relief to the corridor much sooner, and more efficiently. In the future, once the ridership is proven and the funding is available, upgrading this BRT system to rail may be warranted, although at this point we do not feel the conversion to rail can be committed to. (0139, 0280-T –4) (0139, 0139-T –4)

Public Comment: It's not clear that we need the capacity of rail or even BRT, but BRT does appear to provide an expandable, quickly available start. I see the BRT choice costs 1/8th the cost of the train, and a small fraction of the others. This seems to be a no-brainer. Please do only BRT. This should allow dropping the toll entirely. (0155, 0155-T –2)

Public Comment: I am here as a proponent of BRT, but not the BRT in the plan, and a vigorous opponent of rail west of Tysons. And the reason is the cost of rail is approximately eight times that of BRT. What do we get for the extra money? My answer is we get absolutely nothing of value for the extra money. (0184, 0184-T –1)

Public Comment: Everyone agrees that we need rapid transit. Everyone agrees that we need it now. We believe that the bus rapid transit, or BRT, system is able to do the job quickly and more a whole lot less money. (0138, 0241-T –1)

Public Comment: BRT is very quick because all you're recall doing is expanding an existing system. Much of the infrastructure that you need is already in place. The greatest part of the route is down the Dulles road on the center lanes and it's already there. So you can - once you've ordered the buses, the BRT buses, you can be up and running very quickly. (0138, 0241-T –6)

Public Comment: Everybody agrees that we need rapid transit in the Dulles corridor. I think everybody agrees that we need it now. I think everybody who has looked at a material agrees that metrorail costs in the range of eight to 10 times more than BRT. And we believe that BRT has been seriously underestimated in the studies done as the EIS. (0138, 0169-T –1)

Public Comment: We know that BRT can do the job. It is very acceptable as a mode of travel, and it's a whole lot cheaper. It's a whole lot simpler. It builds on an existing express bus system. You don't have to go and create a whole new infrastructure, highly specialized, very rigid, the way the rail system is. You have a flexible, resilient system that is adaptable to changing needs, and the land use pattern that has emerged in the suburbs outside the beltway, particularly outside the beltway. (0138, 0169-T –4)

Public Comment: BRT has the following advantages over metrorail: BRT can be in operation within 18 to 24 months and in full operation within three years. MRL will not be in operation at Dulles airport we believe until at least 2015. Just look at what has happened to other transportation projects like the mixing bowl, the Wilson Bridge, and the big dig, for example. Everything takes a lot longer than was projected. (0138, 0241-T –5)

Public Comment: BRT would provide benefits much quicker, within a couple of years at a substantially reduced cost with better access for McLean residents. With BRT giving more immediate, cost effective benefits rail could be added at a later time if it is still make sense. (0233, 0426-M –27)

Public Comment: Briefly, BRT seems to have the following advantages over metrorail: Timing. The EIS projects that metrorail will be in operation by 2010. We believe that the more likely time to start carrying passengers from Dulles is 2015 to 2020. Until the last piece of track is laid and the last station finished, rail can't carry a passenger. BRT, on the other hand, builds on existing infrastructure and existing express bus system. With good management, it should be possible to deliver an operating system even faster than projected in the EIS. We believe that BRT can deliver substantially upgraded service in 12 to 18 months, with continuing improvements in the years ahead. (0138, 0138-T –2)

Public Comment: At well over $3 billion dollars, the Metrorail option is extremely expensive. Although it would undoubtedly be a tremendous asset to the region, BRT has many potential advantages that have not been considered. For example, BRT could be built for a fraction of that cost, leaving money left over for other important transit projects in the region. This could lead to a far greater improvement in the region's air quality and traffic problems than the proposed Metrorail extension. (0444, 0444-E –2)

Public Comment: I would prefer the Bus Rapid Transit (BRT) option instead of one of the rail or combined rail/BRT options. Much of the infrastructure is in place for the BRT and that which is still needed could be built quickly and for far less money than the rail option. (0401, 0401- L-1)

Public Comment: In summary, we believe that MetroRail is not a cost-effective or appropriate mode for the Dulles Corridor. If the DEIS were corrected to overcome the deficiencies noted above, as well as others, we believe that the competitive advantages of other modes such as BRT would be overwhelming. (0138, 0476-L –7)

> ***Response****: Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative. The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Need to Consider Elevated BRT

Public Comment: I support BRT. Consider, again, the elevated route for BRT through Tysons. (0038, 0038-CC-1)

Public Comment: Make this BRT model work on Dulles project and take lessons learned to do the same on I-66 to Manassas, Gainesville, Warrenton. Lessons: (0038, 0038-CC-2)
- Elevated BRT route
- "One seat" concept to merge bus into rail
- Special access rights for BRT on existing pavement. Even if that means taking HOV away

Public Comment: Questions why there are no BRT stations in Tysons Corner. The Draft EIS failed to consider an elevated busway in the same location as Metrorail. Cites Corridor Cities DEIS 14-mile elevated busway from Shady Grove to Clarksburg convertible to light-rail. Elevated busway through Tysons Corner would be 4-6 miles. (0112, 2-11)

Public Comment: Several speakers at the hearings have spoken favorably of bus rapid transit as a low cost alternative to metrorail and pointed to information on the internet which is said to support the BRT option. Today I reviewed that information that I could find and can comment on what I have seen. The small number of BRT systems that are described all require a separate busway to operate. This is the problem with using BRT in the Dulles Corridor. There is no separate busway or roadway for buses within Tysons Corner, which is the largest concentration of activity in the corridor. The BRT proposal solves this problem by ignoring the need to serve Tysons Corner. There simply is no service provided within the boundaries of Tysons Corner in the BRT plan. So for the many workers who live in this area and commute to Tysons Corner, BRT offers no help whatsoever. One of our goals in this process should be

to avoid building a system that does not serve major parts of the corridor, because to do so is poor planning and bad public policy. BRT simply does not serve the largest activity center in the corridor. (0144, 0261-T –2)

> ***Response**: The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*
>
> *An elevated BRT alignment thorough Tysons Corner had been considered during the development of the Dulles Corridor Transportation Study (June 1997), a Major Investment Study conducted by DRPT, but was not carried forward because it was not as cost effective as other alternatives.*
>
> *An elevated BRT could have served Tysons Corner better than a station at Spring Hill Road, and this service would likely have increased ridership. However, the elevated guideway in Tysons would have been more expensive and taken longer to construct (similar to an elevated Metrorail), and this would have eliminated the two primary advantages of BRT. Also, the forced transfer at West Falls Church would have remained; thus ridership would not have increased sufficiently to justify the increased cost and time of building an elevated BRT alignment in Tysons Corner.*
>
> *A "one seat" ride concept to merge BRT and Metrorail operations would not have been technically practical. Because the technologies are not compatible, it would not have been practical to run BRT vehicles on the same right-of-way with Metrorail vehicles.*
>
> *Exclusive or controlled lanes are part of the definition of BRT systems, and the Dulles Corridor Rapid Transit Project BRT 1 and BRT 2 alignment options would have used the controlled lanes of the Dulles Connector Road and when necessary the reserved lanes of the Dulles International Airport Access Highway to achieve the levels of service needed for reliable transit service.*
>
> *The I-66 Study has been beyond the scope of the Dulles Corridor Rapid Transit Project. The team conducting that study has been coordinating with the Project Team and can take advantage of the lessons learned in developing the BRT alignments for the Dulles Corridor Rapid Transit Project.*
>
> *The proposed BRT Alternative of the Draft EIS would have provided service to Tysons Corner, though this service would not have been as direct as that provided by the Metrorail Alternative. As outlined in Chapter 2 of the Draft EIS, and in the Transit Operations and Maintenance Plan (June 2002), the proposed BRT Alternative included feeder bus service that connected to all of the proposed stations. In Tysons Corner, feeder buses provided service between the Spring Hill Road Station (or Tysons-West*Park Stop) and the rest of Tysons Corner. Passengers would have transferred from the line-haul BRT service to this feeder service to reach their final destinations in Tysons Corner.*

Need to Consider Financial Advantages of BRT

Public Comment: Now make no mistake about it. When you select the Locally Preferred Alternative, you are setting aside all but that one alternative. If the selection is Metrorail, then the financial advantages of BRT are never going to be studied, and I think that would be a grave mistake because if our research - and our research is from government-produced sources, actual case studies around the world and particularly in this country - if that research is sound, then BRT is an innovative, flexible way to solve these problems. (0138, 0241-T –9)

> ***Response:** The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT was eliminated from further consideration after the public and interagency review and comment on the*

Draft EIS. The selection of the Locally Preferred Alternative was based on the evaluation of all alternatives presented in the Draft EIS and the comments received during the public comment period.

Consideration of Less Costly/Environmentally Damaging Options

Public Comment: Third, surely there must be other options to be explored which would be less costly and more environmentally friendly. How about not increasing the FAR. How about requiring car and van pooling. Go with BRT only. Give other people a chance to come up with new ideas. The group pushing BRT/rail has a very narrow agenda and that agenda may not be in the best interests of the citizens of the Commonwealth. (0203, 0203-L –6)

Response: *During the Major Investment Study and alternatives analysis phase of the Dulles Corridor Rapid Transit Project, many transportation solutions, including travel demand management measures, such as car pools and van pools, were analyzed. It was determined that BRT and Metrorail or a combination of these modes would best serve the needs of the corridor. Therefore, these modes were included in the detailed evaluation presented in the Draft EIS.*

BRT Can Provide Comparable Service at Lower Cost

Public Comment: The bottom line is that, properly implemented, Bus Rapid Transit provides a level of service which is equal to rail in frequency and quality of service, at a lower fare box rate, and a much lower capital and operating expense. The ratio of cost for BRT as compared with rail is about 1 to 8, as the numbers in the EIS indicate. We have an independent confirmation of this ration based on the recently opened 61-station Bus Rapid Transit system in Bogotá, Colombia. Their system, which is considerably more elaborate than anything proposed for the Dulles Corridor, cost $240 million. Their estimate for an equivalent rail system is $2 billion. (0162, 0162-M –1)

Response: *The commenter is correct in stating that the Metrorail Alternative will be more expensive to build and operate than the BRT Alternative would have been. As described in Chapter 2 of the Draft EIS, the frequency and quality of service for both alternatives is comparable. However, as indicated in Chapter 8, the two alternatives were assumed to have the same fare structure, which would have been identical to that for the existing Metrorail system.*

Cost comparisons between BRT in Colombia and BRT in the Dulles Corridor have not been appropriate comparisons. Most Transmilenio platforms are accessed at grade. Dulles Corridor stations would have required pedestrian bridges and associated vertical circulation, which unlike Transmilenio, usually includes both elevators and escalators. Dulles Corridor BRT costs also would have included structured parking at certain stations, new acceleration/deceleration ramps for station access along the DIAAH, and Metrorail vehicle costs for the increased ridership on the Orange Line that would have resulted from the BRT Alternative.

In addition, the cost of construction varies between countries because construction practices—particularly labor costs—are very different. Other reasons for differences between the Transmilenio costs and the projected Dulles Corridor Rapid Transit Project costs have been related to the escalation of Dulles Corridor costs to year-of-expenditure dollars. Transmilenio began operation in December 2000, therefore published costs for that project typically represent dollar values in the late 1990s. Dulles Corridor costs reflect the assumed effect of inflation on the value of the dollar over the next five years. Therefore, the cost estimates between the two systems were not comparable.

It also was not appropriate to suggest that the ratio of cost estimates for BRT and rail systems in Colombia constitute independent confirmation of cost differences for these modes in the Dulles Corridor. Cost differences for the Dulles Corridor are related to a number of factors that may or may not apply to the "equivalent rail system" in Colombia. BRT in the Dulles Corridor primarily would have made use of existing roadways, and only requires a small maintenance and storage

facility. Metrorail will include more stations, up to two underground sections, numerous aerial structures, more parking structures, and require a large new service and inspection yard.

Build Upon Existing Bus Infrastructure

Public Comment: Metrorail doesn't really do the trick, but BRT does. BRT uses an existing system and builds on existing infrastructure. BRT has worked in other cities. BRT would substantially improve the flow of commuting traffic from Maryland to and from Northern Virginia. For example, workers could use a BRT line that would run from Rockville to Reston that would get workers to work on time and at a much lower cost than metrorail could ever provide. It would also cut time out of the commute that what would be estimated using the metrorail system. (0183, 0183-T –5)

Response: *The Draft EIS only addressed rapid transit improvements within the Dulles Corridor. Alignments between Rockville and Reston were beyond the scope of the study. Other transportation improvements (both highway and transit) outside the Dulles Corridor have been recommended in the Northern Virginia 2020 Plan, Statewide Transportation Plan, and local comprehensive plans and are being pursued by VDOT, DRPT, and others. This program of improvements has been intended to increase mobility and address the existing and potential future deficiencies in Northern Virginia.*

Reject Rail and Support BRT

Public Comment: After looking at the data that I've seen -- and I haven't read every bit of the EIS -- I really have to urge the Commonwealth Transportation Board to reject the rail transit proposals as presented and support bus rapid transit instead, unless there is some significant scaling back of the fixed rail proposal. I don't feel like there's enough data on new riders, actual new riders, for either BRT or rail service here. There's really no data on congestion relief for the toll road and other roads, and there's a lot of assumptions about land use densities. (0112, 0245-T –1)

Public Comment: A better solution would be to plan for a link to a bus system, rather than build the "build or bust" solution that has been recommended by the Project Team. (0294, 2-01)

Response: *Data on new riders for both the BRT and Metrorail alternatives were presented in Chapter 6 and Chapter 10 of the Draft EIS. Detailed ridership projections are also included in the* Travel Demand Forecasting Methodology and Results Technical Report (June 2002).

The ridership estimates, which were presented in the tables in the Draft EIS, were based on the regionally approved land use forecasts, which do not include the recently adopted density bonuses. Metrorail ridership was also estimated for the forecast year assuming that there is additional development around stations in Tysons Corner and Reston, as permitted under the Fairfax County Comprehensive Plan. However, these estimates were not used in determining the cost effectiveness measures presented in Chapter 10.

Chapter 6 of the Draft EIS presented the anticipated effects of the proposed Build Alternatives on regional roadways, including the Dulles Toll Road. None of the Build Alternatives were expected to result in reductions in congestion on most regional roadways. Traffic conditions in the vicinity of proposed stations were generally expected to worsen during the peak periods as transit patrons drive to and from these stations. However, each of the proposed rapid transit alternatives, in combination with the planned transit-oriented urban form, would have helped to increase overall mobility in the corridor, the counties, and the region.

Public Comment: I know that - I think Mr. Dittmeier said that the bus rapid transit really couldn't be used inside of Reston. However, if you had a single stop outside, you could redistribute with the internal circulation method. Let's keep "rapid" in the name. Fewer stops can create more opportunity. (0148, 0250-T –4)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

As described in Chapter 2 of the Draft EIS, the BRT Alternative would have consisted of up to four stations/stops in the Reston-Herndon area. Stations were located in the median of the DIAAH, and stops were located at park-and-ride facilities adjacent to the DIAAH and Dulles Toll Road. As then proposed, travelers would have accessed Reston Town Center and the Town of Herndon by transferring to a feeder system that would have served multiple destinations in these areas. This feeder system would have built on the existing bus service in the corridor, including Fairfax Connector routes and the Reston Internal Bus Service (RIBS).

BRT Capacity

Public Comment: The four urban legends, some of which we heard tonight, is that BRT cannot handle the projected demand for transit in the corridor. That is flat out totally incorrect. (0184, 0184-T-2)

Public Comment: The groups supporting rail do so for one of three reasons: first, they think that only rail has the capacity to carry transit demand in the Dulles Corridor (most definitely not true!) (0162, 0162-M – 2)

Public Comment: And the proponents of rail say, well, only rail has the capacity to carry the total load of people, and frankly the web sites show that's simply not true. BRT is shown to be in other cases, other existing operating systems, fully capable of carrying at least as many people as the maximum projected by the EIS. (0138, 0169-T –3)

Public Comment: Now I believe when I listened to the other speakers so far, the problems that Falls Church talks about, you don't have those with BRT because you can have more collection points. If you liberate yourself from the EIS assumption that there are a small number of stations, the fact is BRT stations are much less expensive to build, and most systems in Dade County, in Honolulu, and in the Trans Molino case, they have lots more collection points. They have a better distribution of the passengers to where people want to go. (0138, 0169-T –5)

Public Comment: I also learned from the internet information on BRT that some BRT systems operate with accordion buses, in other words, an elongated bus somewhat like a double trailer we see on the highway. It is apparent from viewing such a bus that this vehicle does not have the capacity of a six or eight-car metro train, yet we were told last evening that the two systems have the same capacity to move large numbers of people, as we would have here. This is obviously not accurate. (0144, 0261-T –3)

Public Comment: Disagrees with the carrying capacity methodology for the BRT Alternative. Claims the Metrorail Alternative would not have the traction power to run eight car trains, and that no eight car trains currently operate. Claims the 9,600 passengers per hour under the Metrorail Alternative is dishonest since it assumes eight car trains which cannot operate. Questions using TRB as policy for standing on buses. Points out that buses running on I-395 have straphandlers and standees. (0112, 2-12)

Public Comment: The study never considered the use of higher capacity buses. It also assumed that bus capacity was only the seating, whereas Metro operates at a typical capacity of 140 people per 80-seat car. (0162, 2-05)

Public Comment: Run capacity of BRT to equal rail. (0038, 0038-CC-3)

Public Comment: My main concern at this point is that the bus rapid transit system doesn't seem to have an appropriate operating concept and isn't a fair evaluation of its possibilities. (0255, 0255-T –1)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

The issue of BRT being able to handle the transit demand in the Dulles Corridor was explored as part of the Project Team's review of Dulles Plan B during the public comment period of the Draft EIS. Transportation systems must be designed to support the demand expected during the "peak of the peak," even though this may result in under-utilization of capacity for the rest of the peak period.

As described in Chapter 2 of the Draft EIS, the BRT Alternative would have used 60-foot, articulated, low-floor, diesel buses. For the analysis in the Draft EIS, BRT vehicles were assumed to have a capacity of 61 seated passengers. Standees would not have been allowed on high-speed bus service on busways and HOV lanes. The Transportation Research Board's Transit Capacity and Quality of Service Manual (1999) notes that, "High-speed bus service on busways and HOV lanes should not allow standees, so capacity calculations should assume that every passenger may be seated" (Page 2-41).

Other commenters have suggested that the Dulles Corridor project could have used the same vehicles in use in Bogotá, Colombia, which they indicated have 160 seats. However, the Transmilenio vehicles do not have 160 seats—they accommodate approximately 160 passengers (43 seated and 114 standing). This standee load is based on an area of 4 persons per square meter, or 2.7 square feet per person—a standard that most riders would find very uncomfortable (at this density contact with other persons is unavoidable).

As described in Chapter 2 of the Draft EIS, the operating plan for BRT would have resulted in approximately 80 BRT vehicles serving the eastern end of the corridor in the peak hour in the peak direction. With approximately 61 seats per vehicle, the peak-hour capacity provided by the BRT Alternative would have been 4,880 passengers. The Metrorail operating plan will result in 9 trains traversing the corridor in the peak hour in the peak direction. With 8 cars per train and a loading goal of 120 passengers per car per hour, the Metrorail Extension will provide capacity for 8,640 passengers during the peak hour. Therefore, Metrorail capacity in the Dulles Corridor would be nearly twice that of BRT.

The Project Team's analysis relative to Dulles Plan B also demonstrates that if vehicle size had been increased to 80-foot bi-articulated buses with approximately 80 seats (the largest BRT vehicles currently available), the maximum capacity that could have been provided by the BRT Alternative as then defined would have been 6,400 persons in the peak hour and peak direction (80 buses per hour serve the corridor during the peak period). This capacity would still not have been enough to meet the peak demand of approximately 7,000 persons for Metrorail.

Space considerations at West Falls Church would have limited the ability to increase the number of BRT vehicles operating in the corridor during the peak hour. At the then peak period flow rate, vehicles would have arrived at West Falls Church every 45 seconds, on average. More frequent arrivals would have likely resulted in delays as buses would have been forced to wait for an open bay until buses in front of them pulled out.

However, in other cities, where the same limitations on standees and the volume of buses would not apply, BRT could have much higher capacities. In some cases, BRT systems carry the same level of demand as rail systems.

However, capacity is not what truly would have limited the ability of BRT in the Dulles Corridor to serve the same level of demand as Metrorail. BRT would not have had the same "drawing power" as Metrorail because of a combination of other factors:

- *BRT would have forced travelers bound for Arlington and the Core to transfer at the Orange Line (or at Tysons West for BRT/Metrorail).*
- *BRT would not have provided a direct connection to Tysons Corner. It would have required travelers to transfer to another feeder system before reaching their final destination in Tysons Corner.*

However, the BRT operating plans did include capacity enhancements that would have been needed to meet the anticipated demand for BRT, such as bus platooning, and 'express' service patterns that do not stop at each BRT station.

Operating Benefits of BRT

Public Comment: Second, BRT is somehow viewed as a lesser quality type of operation. In fact, the opposite is probably possible. Well-designed bus vehicles will have higher maximum speeds, faster acceleration, smoother rides, quieter operation, they're more efficient, and they can be made to run on fuel other than gasoline. (0184, 0184-T –3)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

BRT vehicles would have had the performance characteristics similar to Metrorail. The noise and emissions output would have varied depending on the propulsion technology selected, but in no case are they superior to Metrorail. In addition, the top speed of BRT would have been be limited to the posted speed of the roadways, on which they operate, which is not as high as Metrorail's top speed.

Questioning Credibility of BRT Report

Public Comment:

- Do not be deceived by GAO report on "Bus Rapid Transit Shows Promise." Report was politically motivated and is full of errors and misrepresentations.
- Says that commenters that have suggested natural gas buses are better for air quality than Metrorail are incorrect because natural gas buses must burn fossil fuel that becomes exhaust. Also notes that a commenter's suggestion that BRT starts improving air quality sooner and is therefore better, is not a valid argument, because the BRT's four year jump start on Metrorail is like nothing compared to the fifty or ninety year life of the far superior Metrorail project. Cites additional statistics demonstrating that rail is more fuel-efficient than buses.
- States that many of the comments supporting BRT in Section 6.2.4.1 of the *Public Hearings Report* are ripe with unsupported assertions. Explains that emphasis on "cost" rather than "investment" is an example. Investment is an asset that must be amortized over many years and take into account service life and safety to equate it to cost.
- Metrorail opponents cite unknown websites as proving the superiority of BRT, but these websites are typically anti-rail think tank contrivances for vested interests. These websites do not reflect the real world. In Curitiba, the mayor says his BRT buses carry 280 people each to outdo rail transit. His buses are almost the same size as our Metrorail car which draws protests over 120 per car.
- Discusses benefits and deficiencies of busway in the Lincoln Tunnel. The commenter believes that the busway is better than no busway but it is not a good solution for the problem. The cost of that one bus station in current dollars is about a billion dollars. West Falls Church cannot handle it. (0013, 2-05)

Response: *Comments noted. The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Public Comment: Busway safety could be a very serious problem with left-handed operation in the stations, crossing in front of each other entering and leaving each station. (0013, 2-10)

Public Comment: States that the only operator to use crossovers had to go back and put in stop signs. States that the use of left-side doors is not appropriate. (0255, 2-02)

> ***Response*:** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*
>
> *Under the BRT, BRT/Metrorail, or Phased Implementation alternatives, the proposed General Plans (June 2002) were allowing for either conventional (right-) or left-side door vehicle configuration. Crossovers would not have been required for buses with left-side doors. If a conventional door configuration would have been selected, crossovers would have been required to serve a center-platform station, and traffic-signal priority equipment and/or other operating technology might have been employed to avoid conflicts. Since buses operating on the Dulles International Airport Access Highway could have bypassed any median station, in-station passing lanes would probably not have been required.*

Public Comment: Disagrees with the carrying capacity methodology for the BRT Alternative. Claims the Metrorail Alternative would not have the traction power to run eight car trains, and that no eight car trains currently operate. Claims the 9,600 passengers per hour under the Metrorail Alternative is dishonest since it assumes eight car trains which cannot operate. Questions using TRB as policy for standing on buses. Points out that buses running on I-395 have straphandlers and standees. (0112, 2-12)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*
>
> *In preparing the Final EIS, the Project Team developed and evaluated the No-Build Alternative with the assumption that WMATA would be funding and implementing eight-car train operations to satisfy forecast demand prior to the Project. WMATA has been emphasizing to the Commonwealth of Virginia and to the Project's other funding partners the critical importance of the implementation of eight-car train operations. Through its Metro Matters program (see www.wmata.com/about/metro-mattersfactsheet.pdf), WMATA has successfully garnered agreements among its Compact member jurisdictions for the minimum funding of its urgent capital needs in order to sustain the Metrorail and Metrobus systems. WMATA continues to seek the Federal share of Metro Matters. Within the $3.3 billion Metro Matters program, there is over $600 million for the eight-car train operations. The Metro Matters procurement of 120 new rail cars will equip one-third of the Metrorail system with eight-car trains. Over time, WMATA will continue to procure new rail cars for higher number of eight-car trains to relieve future overcrowding and keep pace with ridership growth.*

Public Comment: States that is it inaccurate to suggest that express buses will not be studied as WMATA operates express buses in other corridors. (0112, 2-13)

> ***Response:*** *For the Wiehle Avenue Extension evaluated in the Final EIS, the Corridor express bus service, formerly referred to as 'premium bus', would be designed to mimic service provided by the rail system west of Wiehle Avenue to the greatest degree possible. Given this, passengers would board the express bus service at each of the express bus stops in the corridor, including Route 772, Route 606 (Dulles North Transit Center), Dulles Airport, and Herndon-Monroe. The operators of the Corridor express bus service. The corridor express bus service would be the*

continuation of the existing bus services in the corridor operated by Loudoun and Fairfax counties.

In response to this comment in the context of alternatives to the BRT or Metrorail Alternatives of the Draft EIS, the Project Team offers the following response.

WMATA does operate express buses but, for this project, utilization of point-to-point express services in place of BRT or Metrorail in the corridor was not deemed to be cost effective. Some commenters have suggested that because BRT is more flexible than a rail system, its operating pattern should be based on multiple "point-to-point" express services. However, it would have been very difficult to provide a cost-effective service for the Dulles Corridor using several, dedicated express routes due to the relatively dispersed land use patterns. For a point-to-point transit service to be as efficient as possible, it must be able to attract a large number of travelers within a relatively small area at the origin end that all want to go to the same destination (or multiple destinations within a small area). Travel time at the "circulation and distribution" end of the trip should not be more than 10 minutes, or the increased travel times make the dedicated service a less attractive travel alternative.

Public Comment: Questions the carrying capacity of WMATA's articulated buses and why they were not studied for BRT use? (0112, 2-14)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

The BRT vehicles that the Project Team used for planning purposes were similar to the articulated buses used by WMATA, though the BRT vehicles would have had higher seating capacities than the existing articulated buses. For that reason, BRT vehicles were used as the basis for operations planning in support of the Draft EIS.

Need to Reevaluate BRT Speeds

Public Comment: Average speed not clearly defined on page 107 of the Transit Operations and Maintenance Plan Technical Report. Use of 31 mph for BRT is low-balled since there are no stops in Tysons and no buses on city streets. BRT speeds should be based on Shirley Highway (I-395) HOV speeds. (0112,2-15)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

The most relevant input for operations planning and demand estimation is travel time, which is presented in the Transit Operations and Maintenance Report (June 2002). In addition, average speed can be easily calculated using the data provided. Run times for BRT were calculated utilizing allowable and likely speeds in the DIAAH, acceleration speed, and the requirements for vehicles accessing stations in the median from the left hand lane of the DIAAH. Using speeds from the Shirley Highway would not have been accurate because the Shirley Highway has no stations.

Incomplete Hearing Testimony

Public Comment: States that the transcript of his hearing testimony is incomplete. States that his comments on the experiences of actual BRT operators and effective BRT operating plans was left out. Cites that the City of Pittsburgh operates a busway into neighborhoods that has comparable capacity to

Metrorail. Believes that the response to his comment reflects the opposite of operations and experiences of every busway operator in North America. Suggests that the Project Team interview busway operators. (0255, 2-01)

> ***Response:*** *The Project Team reviewed the original testimony submitted by Mr. Stephens. Comments in his testimony included ridership, vehicle, and trip length information pertaining to the Pittsburgh East busway. These comments are addressed in Sections 6.2.2 and 6.2.4.4 of the Public Hearings Report (October 2002) and within this Appendix J.*

Need for Independent Analysis

Public Comment: Report did not consider alternatives that would have been result of truly independent analysis. In particular, the study never looked at a BRT system running along the same alignment recommended for rail. The commenter believes that the study was obviously biased towards rail. (0162, 2-02)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*
>
> *Both BRT and Metrorail were designed to primarily serve the east-west travel demand between existing and emerging activity centers along the Dulles Toll Road, and between these centers and the region's core. As described in Chapter 1 of the Draft EIS, both were intended to function as an extension of the existing Metrorail system, taking advantage of the direct connection this system already provides to Arlington and the region's core. In the context of the Dulles Corridor Rapid Transit Project, BRT was meant to be a complement to the existing regional rapid transit system, not a competing regional system. Therefore, BRT routes that provide direct connections between the Dulles Corridor and Arlington, Washington, D.C., or Maryland rather than connect to the existing Metrorail system at the eastern end of the corridor would not have been appropriate in the Dulles Corridor. Moreover, given that BRT vehicles would likely have had to travel on congested roadways to reach these regional destinations, it is doubtful they would have offered faster travel times than the existing Metrorail system, which operates on an exclusive guideway.*

BRT Capacity Understated

Public Comment: The commenter states that many successful BRT systems operate today with higher capacities. Should have been studied. (0162, 2-03)

> **Response**: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*
>
> *The BRT Alternative was developed to provide high-quality service akin to a rapid rail system. It was intended to provide rail-like service and amenities at a lower cost. The intent had been to evaluate a lower-cost, lower-impact alternative to see if could have provided the same level of benefit as a Metrorail Alternative.*
>
> *Every effort was made to leverage prior transportation investments in the corridor. The BRT Alternative made use of the relatively exclusive travel way in the DIAAH to provide rapid, limited-stop service for long-distance trips between the corridor and the region's core. However, operating the BRT service on congested roadways, particularly in Tysons Corner, to provide lower cost transit solutions would have increased travel times and offered little benefit over driving. Such a system would have not been an attractive travel alternative, and would not likely have attracted high ridership. In addition, Fairfax County and VDOT would have been unlikely to*

dedicate a lane for exclusive bus use, given that many roadways are expected to operate at or above capacity in the future.

Therefore, BRT would have needed to operate on a grade-separated route through Tysons Corner. Both an elevated route and an underground route would have added considerable expense and construction time to the project, thereby diminishing two of the primary advantages of BRT in the Dulles Corridor. Because a grade-separated alignment for BRT through Tysons Corner would have increased the cost, construction time, and impacts of the alternative, this was not considered an advantageous configuration for the BRT Alternative, especially given that it would still have required a transfer at West Falls Church, reducing overall ridership as compared to the Metrorail Alternative.

Potential for Dedicated Bus Lanes

Public Comment: Suggests that since WMATA can make buses run on K Street that buses on dedicated lanes can work in Tysons Corner. (0162, 2-04)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

As described in Chapters 2 and 6 of the Draft EIS, several roadway capacity improvements are planned for Tysons Corner over the next several years, including roadway widening and construction of grade-separated interchanges. These capacity improvements are needed to meet increasing demand for travel to, from, and through Tysons Corner. However, as shown in Section 6.1. of the Draft EIS, very few of these improvements are actually expected to improve the level of service on Tysons Corner roadways between 2000 and 2025. Many roadways are expected to experience worsening conditions, while others will remain at their current state of congestion.

Given that many roadways in Tysons Corner are expected to operate at or above capacity in the future, even after capacity increases, the roadway operators (including Fairfax County and VDOT) would have been unlikely to dedicate traffic lanes for transit service—especially considering that the highest transit mode share that an environment like Tysons Corner (an urban edge city) would have been likely to experience would have been approximately 12 percent (as evidenced by the mode share data presented for the two Build Alternatives in the Final EIS).

Contradicts Emissions Assumptions of Buses

Public Comment: One flagrant misstatement is that Metrorail is inherently lower pollution than buses. However, new technology for bus engines is virtually zero-emission, and Metrorail is powered by electricity at lower efficiency, moving greater masses. (0162, 2-07)

***Response*:** *The Draft EIS did not state that Metrorail is inherently lower in pollutant emissions than buses. New buses do have much lower emissions than older models, due to advances in engine design and emission control technology. The emissions associated with Metrorail are attributable to fuel combustion at electric power plants, discussed below. However, a Metrorail train can carry many more passengers than a bus. Depending on the service and ridership characteristics being compared, one might expect a bus to have lower emissions on a per-vehicle basis, but Metrorail to have lower emissions on a per-passenger or per-seat basis.*

The emissions that result from the demand for Metrorail were not described in the Draft EIS due to the conformity process required by the Clean Air Act and the requirements to account for mobile and stationary source emissions. Power plant emissions due to all existing and future

projected demands, including those for the Metrorail extension, are accounted for as part of the statewide emissions inventory and included in the SIP.

In addition, all power plants must submit to a strict permitting process by demonstrating compliance with all applicable emission limits and ambient air quality standards established by the U.S. EPA and the Virginia DEQ. Therefore, power plant emissions caused by power demand to operate Metrorail, or the rest of the region's electrical grid, are documented and regulated by the federal and State conformity process.

Emissions from all power plants located in the Metropolitan Washington Council of Governments region are accounted for in the SIP prepared by the MWCOG. Emissions from the Mount Storm facility in West Virginia would not be included MWCOG's SIP, but rather the West Virginia SIP.

Questions Decision Making Process

Public Comment: Appears the recommendations of the Project Team were a forgone conclusion. Report done simply to justify the preferred alternative. BRT casually tossed aside. Huge additional cost of rail not justified in recommendations, and therefore the credibility of the report is in question. (0488 01)

Response: *The Project Team did recommend and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

The Project Team recommended the Metrorail Build Alternative of the Draft EIS since it would:
- *provide better access to corridor activity centers;*
- *provide better access to regional activity center because a mode transfer would not be required;*
- *shorter travel times for trips within the corridor;*
- *provide the greatest increase in person throughput capacity in the corridor;*
- *attract the highest number of total riders and new riders;*
- *better support the comprehensive planning efforts of Fairfax and Loudoun counties;*
- *allow for more transit-oriented development to be focused in station areas;*
- *increase the overall mobility within the corridor, the counties, and the region;*
- *enhance air quality more than any of the other alternatives; and*
- *conform to the region's air quality plans by providing the greatest contribution to reducing emissions and improving the region's air quality.*

Although the BRT Alternative did measure higher over the Metrorail Alternative in terms of implementation time and costs, it could not have satisfied the long-term travel demand of the corridor and does not provide the necessary travel service through Tysons Corner.

Funding Options

Public Comment: Federal funding may not be available for rail. BRT is more feasible in terms of funding. (0488 03)

Response: *The Project Team did recommend and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

As stated in Chapter 8 of the Final EIS, DRPT and its funding partners are seeking $760.7 million in Federal funding for the Wiehle Avenue Extension through FTA Section 5309 New Starts program. This funding level represents 50 percent of the estimated project costs, consistent with FTA's recent practice for major transit capital investments. A total of $163.5 million in Federal

New Starts funding has been appropriated for the Project through fiscal 2004 to support project planning, environmental review, and engineering activities. An additional $20 million of New Starts funding for the project is expected in FY 2005. In addition to these appropriations, DRPT has requested that $600 million in additional New Starts funding be authorized for the Dulles Corridor Rapid Transit Project in the pending transportation reauthorization. A Full Funding Grant Agreement will be required to secure any authorized federal New Starts funding for construction of the Wiehle Avenue Extension. The terms of the FFGA, including the level and timing of federal funding participation, will be finalized following completion of preliminary engineering activities.

Selection of Metrorail Alignment in Tysons Corner

Public Comment: Recommended Tysons alignment follows the "cost is not an issue" philosophy of the entire report, and picked the most expensive option. (0488 04)

Public Comment: It is unfortunate that the T-2, T-5, T-10, and T-11 options are no longer being considered as the true loop operation they would have afforded, would have minimized transfers for intra-Tysons trips. I advocate resurrecting these options for consideration, but failing that, the T-4 option is by far the best Tysons proposal currently on the table as it offers the largest number of stations. (0134, 0134-T –5)

Response: *The Project Team recommended that the Metrorail Alternative of the Draft EIS follow Alignment T6 in Tysons Corner because it would:*

- *Provide for the highest ridership, highest number of new riders, and highest transit mode share for most corridor subareas;*
- *Be consistent with existing transportation infrastructure and planned improvements;*
- *Have fewer neighborhood effects than other alignments, especially relative to visual effects;*

and

- *Offer more operational flexibility due to its pocket track and center platform stations.*

Alignment T6 has four stations within Tysons Corner, three of which are aerial and one of which is underground. Alignment T6 has the highest ridership benefits with comparatively few impacts. However, it also has marginally higher capital costs in comparison to the other Tysons Corner alignments. Given that Alignment T6 would provide the highest ridership with the fewest impacts, the Project Team recommended carrying this Metrorail alignment forward as the LPA.

Alignment T9 would have had the same ridership benefits as Alignment T6 because it includes the same number of stations in the same locations. Alignment T9 was not recommended because it would have had greater visual effects than Alignment T6 because most of the alignment would have been aerial and the stations would have been larger in mass due to side platform stations. Moreover, Alignment T9 would have been without the Tysons West pocket track and therefore does not offer train turnback operations for what was then considered the interim terminal station. Alignment T9 might have conflicted with proposed transportation improvements in Tysons Corner, as conceived by VDOT if these improvements were approved and implemented.

Alignment T1 would have had similar impacts as Alignment T6, because the configurations of these alignments were similar. However, Alignment T1 was not recommended because it included fewer stations than Alignment T6 and provided less service area within the core of Tysons Corner.

Alignment T4 would have included more stations in the core of Tysons Corner and have had greater geographic coverage than the other Metrorail alignments. Therefore, the alignment would have had greater potential to foster the high level of development planned in Tysons Corner. However, because the four core stations on Alignment T4 were located on one-way lines, this alignment did not necessarily provide better travel path through Tysons Corner than Alignments

T6 and T9. For Alignment T4, many travelers using the one-way stations would have been required to transfer and double back to reach the station within walking distance of their destination. Alignment T4 would also have had much greater visual impacts than the other alignments.

Opposition to BRT

Public Comment: Bus Rapid Transit will not work well at all. The description of it as "rail like" is a misrepresentation. Buses can not run in labor saving trains, can not run direct to DC in the subway, or provide the safety of rail. The record will show that Bus Rapid Transit (BRT) has attracted hardly one-third of the riders predicted for it. (0013, 0013-L –15)
Public Comment: We cannot afford to risk failures like others have experienced. Fairfax Connector express bus service on the Dulles Toll Road #267 is now providing far superior service to that proposed by the BRT plan before us. Do not waste $350 million on a worse than useless busway. (0013, 0013-L –16)

Public Comment: BRT is not cost-effective.

A. Benefits of BRT are limited to line-haul through-trips in the corridor, and this can be served best without new bus stations in the median.

B. BRT is perceived as a threat to both the existing express bus system and timely delivery of rail service.

C. BRT costs too much in relation to the limited benefits.

D. BRT is not supported by most knowledgeable property owners, current transit riders, or community leaders.

E. At 80% Federal funding, BRT was marginally attractive until we learned the facts about costs, conversion problems, ridership, service, land development opportunities, likely 60% Federal share at best, etc. (0173, 0213-M –2)

Public Comment: I also believe that the so-called Bus Rapid Transit (BRT) options, either BRT all the way from West Falls Church to Loudoun County or rail to Tysons Corner combined with BRT the rest of the way to Loudoun County, will not meet the needs of Dulles corridor passengers. In my opinion, it is an inferior choice compared to the proposed rail system and will be a waste of both time and taxpayer's money. My rationale is as follows:

1. Fewer Rider Benefits - The proposed BRT system will not directly serve the central core of the Tysons Corner area, requiring passengers with that destination to transfer to another bus to finish their journey. The BRT system would also require a transfer at the West Falls Church Metro station for those passengers traveling to the Washington region's core. This would dramatically reduce, if not eliminate, the convenience and time-saving benefits of, and thus the incentives for, switching from a private automobile to transit.

2. Fewer Passengers Projected - Due in large part to the reduced travel benefits just mentioned, the BRT system is projected to carry far fewer passengers than the proposed Metrorail options. The comparison of projected opening year new riders is especially significant: using the high end of the BRT and Metrorail traffic estimates in the Draft EIS, the BRT is expected to carry only 14% of the traffic that the rail system would carry. These new riders represent vehicles taken directly off of the Dulles corridor's roads, and thus the BRT system would have much less of an impact on reducing congestion in the corridor than would Metrorail.

3. BRT To Rail Transition Issues - Particularly troubling was the comment in the Draft EIS that conversions of the BRT stations in the median of the Dulles Airport Access Road to accommodate rail service will require up to 18 months to accomplish. What would happen to BRT service during this period? I am deeply concerned that any hiatus in service would destroy virtually all of the momentum gained to that point in growing rapid transit ridership in the Dulles corridor. Furthermore, I am also concerned that some opponents of rail service in the corridor would use such an hiatus, together with the

worry that the costs incurred to establish the BRT system would be wasted, as an excuse not to proceed with building the rail phase of the project.

4. Most Passengers Prefer Rail - Polls have indicated that a vast majority of the residents in the Dulles corridor prefer the rail options over the proposed BRT system, and moreover they want the rail service with minimal delay. Given these expressed desires of the local citizenry, it makes no sense to consider the BRT option, and even the phased BRT/Metrorail option has little appeal since it is projected to cost almost $200 million more to construct than the most expensive Metrorail-only option. (0071, 0214-M –2)

Public Comment: BRT does not serve Tysons Corner. BRT cannot serve Tysons Corner because BRT buses get stuck in the congested traffic and cannot meet schedules. When congestion occurs, it is necessary to move to rail in order to get around the congestion on the roads. For that reason, BRT is not an option for other congested areas in Northern Virginia. The buses will simply be stuck in the traffic. (0144, 0144-T –5)

Public Comment: We heard a lot on the issue of BRT, but I have not heard any explanation of how BRT is going to serve Tysons Corner because they cannot serve Tysons Corner, which is our largest business center in the region. BRT can't move in congested traffic, which is the problem at rush hour at Tysons Corner, and that is why we need to move to rail because in transportation, once your roads are congested, you need to move to rail to move people. (0144, 0190-T –3)

Public Comment: Bus rapid transit has merit in some situations, but the Dulles corridor is not one of them. BRT works best when there is a dedicated right of way with stops in high density residential areas and major destinations. The right of way in the Dulles corridor is too far removed for meaningful pedestrian access, requiring shuttle bus and parking facilities, and as the DEIS indicated, development in that with BRT and around it is unlikely, contrary to a Metrorail extension. Establishment of BRT would actually add to the commute times of many, since it would require a transfer. Fairfax Connector and other bus lines, including commuter service from Loudoun and WMATA, already pick up residents in their neighborhoods or job destinations and make direct connections with Metrorail, using the Dulles Access Road. (0186, 0186-T –2)

Public Comment: BRT is not cost-effective. The benefits of BRT are primarily linehaul, through trips in the corridor, and these types of trips can be served best without stopping at new bus stations along the way. BRT is perceived as a threat by many in the community to both the existing express bus system and to timely delivery of the rail service. BRT costs too much in relation to the limited benefits. In fact, in my judgment, the costs exceed the benefits. BRT is not supported by most knowledgeable property owners, current transit riders, and that's a strong intuitive feeling I sense by the current transit riders, or by most community leaders. At the start of the study, at 80 percent Federal funding, BRT was marginally thought to be attractive, I think, generally in the community until we learned the facts about the costs, the conversion problems, ridership, low ridership, poor service, land development opportunities that come with it, the lack of them, and likely 60 percent Federal share at best. (0173, 0173-T –5)

Public Comment: Two of the three BRT alignments provide no station stop at Route 28. Furthermore, BRT would attract fewer than half the total riders and less than a third of new riders than metrorail. (0175, 0175-T –3)

Public Comment: Third, construction of the BRT all but removes the incentive on public officials to continue seeking means and funds to provide rail transit in the Dulles corridor beyond Tysons Corner. Once the BRT improvements are constructed and placed into operation, they more than become sunk costs, they represent physical reminders of monies already expended and justification for not spending more, particularly during times of fiscal uncertainty and shrinking Federal assistance. We don't believe that the BRT facilities will in fact be temporary facilities. We would encourage you to select the rail-only option, and are happy to provide more particularized impacts in our written comments. (0135, 0135-T –7)

Public Comment: The rate of Federal participation with BRT is only marginally higher than with rail. This increment simply does not justify settling for a transit system which does not meet our needs. (0175,

0175-T –6)

Public Comment: We don't think bus rapid transit represents any kind of improvement. If you are a bus user, you know that the second transfer just about kills your interest in taking a ride. (0141, 0243-T –1)

Public Comment: Bus is a mistake causing further congestion w/o much benefit. (0048, 0048-CC-1)

Public Comment: BRT will be a failure-- it is hardly different than existing express service- not worth the cost. (0062, 0062-CC-2)

Public Comment: The other transit alternatives have serious deficiencies in terms of permanent design and the ability to attract sufficient ridership to make any difference in the level of service in this area. The Bus Rapid Transit (BRT) option and the combination of BRT/Metrorail alternative will not provide the needed roadway capacity in the near term in the most cost-efficient manner. (0014, 0014-L –4)

Public Comment: Everything with BRT would be a waste of time and money. BRT would not substantially increase ridership over the short term and the DEIS shows that it would ultimately detract from the number of riders by 2025 if a rail-only option were chosen. Plus, BRT operation and maintenance costs would cut into the available funds for rail. It just doesn't make good long-term sense to go with BRT. (0034, 0109-E –2)

Public Comment: Conversely, I oppose the BRT as proposed because, one, it offers fewer rider benefits simply because it does not serve the core of Tysons Corner and transfers would be required for passengers to get there; two, because of that, fewer riders are projected compared to what has been shown for the rail option. The comparison of opening year new riders is especially significant. Using the high end of the BRT and metrorail traffic estimates in the draft EIS, the BRT is expected to carry only 14 percent of the traffic that the rail system would carry. These new riders represent vehicles taken directly off of the Dulles corridor's roads, and thus the BRT system would have much less of an impact on reducing congestion in the corridor than would metrorail. (0071, 0215-T –3)

Public Comment: The "BRT Alternative" could handle only a small percentage of the future transportation demand we will see in the Dulles Corridor. A system that provides only for BRT and does not ultimately include rail transit will not receive support from the Airports Authority and the majority of the commercial landowners in the corridor who otherwise could be counted upon to help finance transit improvements. Without their support, the general public would have to assume the majority of the financing burden. Would they accept this? (0088. 0211-M –3)

Public Comment: BRT, as defined in the DEIS, is not cost effective. The benefits of BRT are limited primarily to line-haul through trips in the corridor, and this market can be served best without constructing new bus stations in the median of the Dulles highway. BRT offers few if any benefits to current bus transit users in the corridor. In fact BRT is widely recognized as a threat to existing express bus service by regular current transit users. They remember the fact that a significant amount of neighborhood express bus service to West Falls Church was cut back and diverted to the new park-and-ride lots when they opened. And they understand that new BRT stations in the median of the Dulles highway would be likely to cause more diversions of neighborhood express bus service to those stations. (0478, 0484-E –6)

Public Comment: BRT will do almost nothing to improve transit service to Tysons, and like the situation cited above regarding neighborhood service, some existing buses that now directly serve Tysons could end up being diverted to the bus station in the median that would serve Tysons, thus requiring another transfer for many riders. (0478, 0484-E –7)

Public Comment: When this PE/NEPA process began, BRT was fairly widely seen as being, at best, marginally attractive as an interim service with the promise of 80% Federal funding and the promise that we could get rail sooner, with over-the-weekend conversion of the stations from bus to rail operation. This marginal acceptance of BRT has completely disappeared now that we have learned the facts about the high costs of BRT, the complex and time-consuming conversion problems, the poor prospects for bus

service improvements and ridership increases, the lack of any significant transit-oriented land development benefits for the community, and the fact that funding for BRT is now seen as being 60% Federal at best. (0478, 0484-E –9)

Public Comment: Bus Rapid Transit - Since the proposed Bus Rapid Transit (BRT) will provide little improvement over the current express bus system if buses must share "the regular traffic lanes" in most cases with other vehicles and do not have a dedicated roadway, we see little or no improvement over the current express bus service. Rationale: According to the description provided for the BRT alternatives, these buses would operate in the regular traffic lanes "except in the eastbound direction on the Dulles Connector Road, when buses are permitted to use the shoulder during the a.m. peak periods and during periods of severe congestion, when such use does not present a safety hazard to general-purpose traffic." (0402, 0402-L –7)

Public Comment: Although the outset of the PE/NEPA process, Bus Rapid Transit (BRT) was seen as being marginally attractive as an interim service, further exploration of this possibility has proven it not to be a viable option. The BRT is not cost effective; could threaten existing express bus service; would increase the number of transfers required for many riders; could potentially absorb significant amounts of funds used now for local and express bus service; and, most significant, would likely threaten the timely delivery of rail service in the corridor. (0478, 0484-E –4)

Public Comment: Toss bus rapid transit in the trash. It's not cost-effective. You will be throwing the buses away after, at the most, eight years. Rail is more cost-effective and BRT threatens rail service. I don't support BRT because of the need to change and the number of stops. So Dulles BRT is unworthy of a great city and area. (0181, 0181-T –2)

Public Comment: When I first began studying the Dulles Corridor 12 years ago, I first felt that buses would be the way to go because of the appeal of the low cost alternative. But after studying and becoming aware of the size and complexity of Tysons Corner, Reston, Herndon, CIT, Dulles Airport, the new Air and Space Museum that's on the way, and Loudoun County, I changed my mind. I came to realize that in planning the Dulles corridor, we are dealing with a nationally and internationally recognized are that will be increasingly important to our area, our region, the Nation and the world in this century. (0144, 0144-T –1)

Public Comment: Transfers from/to multiple buses and trains is not attractive to most people. (0515, 2-03)

> ***Response****: Comments noted. Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative. The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Public Comment: The BRT Alternative could handle only a small fraction of the number of airline passengers, airport workers and other commuters projected during the first decade of the system's operation. With this in mind, the Metropolitan Washington Airport Authority and many of the largest commercial real estate owners in the Corridor have strongly advocated immediate development of the full rail system. The financial and technical support of both of these groups is essential to any implementation of a Dulles Corridor transit system. (0204, 0204-M –3)

Public Comment: Nor can the BRT alternative handle the increasing number of passengers using the airport. It's not just the access road that will carry the buses to and from the airport; it's also Tysons Corner, the greenway and the toll road. Who wants to be behind one of those buses going through Tysons Corner at rush hour? Who wants to be on one of those buses going through Tysons Corner at rush hour and trying to get to a flight at Dulles airport? (0204, 0247-T –2)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Daily boardings for the proposed Dulles Corridor stations were shown in Table 6.3-10 of the Draft EIS. As shown in the table, the Metrorail and BRT alternatives would have attracted similar levels of boardings at the Dulles Airport Station. Metrorail will provide greater capacity at the Dulles Airport Station, because this alternative will provide uniform capacity throughout Dulles Corridor. BRT routes, on the other hand, had been tailored to provide the level of capacity need to meet peak demand at various points throughout the corridor.

BRT vehicles for the BRT 1 alignment option would have remained in the Dulles International Airport Access Highway, serving Tysons Corner via a median station near Spring Hill Road. Regular buses used for the feeder service would have operated on local roadways in the core of Tysons Corner, as they do today. For the BRT 2 and BRT 3 alignment options, BRT vehicles would have exited the DIAAH, operated on Route 7 for short distance, then run along Tyco and Spring Hill roads. These alignment options also would have included regular buses providing feeder service along local roadways in Tysons Corner.

Comparison of Impacts

Public Comment: BRT of any kind has nearly the same impact as rail, but much lower appeal & service. (0073, 0073-CC-2)

Response*: The social and environmental impacts from any of the Build Alternatives of the Draft EIS were anticipated to be minor, especially given the length and complexity of the project. BRT would have been much less expensive than Metrorail but would have had significantly less overall passenger capacity then Metrorail.*

Increase in Number of Bus Stops

Public Comment: The BRT will only increase the number of bus stops along the corridor. (0075, 0075-CC-2)

Response: *The BRT Alternative of the Draft EIS had a smaller number of stations and stops than the Metrorail Alternative (primarily because it does not penetrate Tysons Corner). All Build Alternatives of the Draft EIS had included operating plans for a feeder and corridor bus network which included routes feeding into BRT stations or stops within the corridor, as well as regional routes running the full length of the corridor.*

Need to Separate Transit Solution from Traffic Stream

Public Comment: The Dulles Toll Road will reach traffic saturation in the future and Tysons Corner already has trouble that way. Public transportation must be free of such traffic to perform economically and satisfactorily. Buses can not be free of it. (0013, 0013-L –7)

Response: *As presented in the Draft EIS, one of the key advantages of both the BRT and Metrorail Alternatives relative to the No-Build Alternative would have been that BRT would have had and Metrorail will have exclusive right-of-way and thus be separated from general traffic. This would have helped the BRT services from getting caught in traffic (it should be noted, however, that Fairfax Connector Express Services in the corridor do run in the HOV lanes of the Dulles Toll Road, which allows the buses to avoid the worst congestion along the highway).*

Support for the Metrorail Alternative

Public Comment: I have been a believer in rail for a long time, and I think the time is demonstrably here when we need to get rail built. We need to show in America that rail can be built rapidly again, and this is, I would argue, the signature project being in our Nation's capital, connecting the premier international airport with the premier international city. (0083, 0192-T–1)

Public Comment: The need for the Dulles Corridor Rapid Transit Project is here. The full rail alternative is the only sound long-term investment that makes sense, especially considering the environmental impact of even more cars or buses on our roads. I should know. I started working at the Washington Dulles Task Force in 1982 when only 2,000,000 passengers were using the airport. Today there are as many as 16,000,000 passengers using Dulles with a projection of 30,000,000 by 2020. There is no time to waste in approving an environmentally friendly full rail service from Falls Church to Route 772 in Loudoun County. (0394, 0394-L –4)

Public Comment: In general, passengers would find it so much easier to travel back and forth to Washington, D.C. and especially the Tysons Corner area. I urge you to put forth a plan that would provide rail service to Dulles Airport and also to Tysons Corner. (0234, 0234-L –2)

Public Comment: I support fully the Metrorail Alternative; that is, a complete rail transit service running on a dedicated roadbed, from West Falls Church past Dulles Airport and beyond. (0004, 0004-L –1)

Public Comment: Most voters and taxpayers support MetroRail. When more people ride transit, the cost of living goes down and the air gets cleaner. Congestion is minimized for all and avoided for many. Property values are increased. These values are worth real investment capital. (0013, 0013-L –25)

Public Comment: A Dulles Corridor rapid transit rail system would be a wonderful way to help ameliorate the growing transportation issues in the Northern Virginia area. While this will have an immediate impact on the people who live and work in the Northern Fairfax County and Loudoun County area, it will be of great benefit to everyone who flies into or out of Dulles Airport - visitors as well as residents. We hope the project can move forward quickly. (0436, 0436-E –1)

Public Comment: Considering all costs, safety, congestion, air quality, mobility and the quality of life, all measures support MetroRail to Dulles and Loudoun County. Other alternatives will cost more overall and provide less. (0013, 0013-L –38)

Public Comment: The benefits of Dulles Rail now include:

- Providing commuters with an attractive alternative mode of travel.
- Enhancing the quality of life and attractiveness of the corridor for businesses and residents.
- Providing a high-quality, high-capacity transportation choice for residents, visitors, and employees.
- Enhancing the capacity of the corridor to move people among major activity centers and facilities and significantly improves the accessibility of the corridor.
- Creating a significant return on investment to the state and local government from increased economic activity and property values. The higher capital costs of rail are more than offset by increased tax revenues to state and local governments.
- Providing the opportunity to create attractive, community-enhancing, pedestrian-friendly, mixed-use developments around the Metrorail stations.

Building Metrorail to Dulles Airport and beyond now completes the long-planned vision of multi-modal facility in the Dulles Corridor using the served median of the Dulles Airport Access Road. (0154, 0225-M –7)

Public Comment: I wanted to let you know how much I support the proposed Metro Rail extension to Dulles Airport. I strongly believe that building more roads will not help alleviate Northern Virginia's growing traffic problems. But I do believe building Metro Rail to Dulles will. (0008, 0008-E –1)

Public Comment: I want to say three things: That I support the metrorail alternative. I believe that the BRT system as defined in the draft EIS is not a cost-effective system. (0173, 0173-T –1)

Public Comment: First, we support going to rail now as the locally preferred alternative in the DEIS, as opposed to choosing one of the BRT options. BRT does not run through Tyson's Corner and is not an efficient alternative that would meet the area's transportation needs. (0233, 0426-M –41)

Public Comment: I fully support the proposal to construct Metrorail to Dulles Airport. In the event that funding is not available upfront for this option, I support the two-step approach consisting of Metrorail to Tysons Corner and BRT to Dulles followed by the construction of Metrorail from Tysons to Dulles Airport. (0118, 0118-E –1)

Public Comment: My wife and I own a home close to the proposed route and strongly support the idea of a metro rail connector between Dulles and the District. (0009, 0009-E –1)

Public Comment: MetroRail all the way is the only acceptable, useful, prudent alternative. With many real advantages and almost no real disadvantages other than devising the optimum funding mechanism. DEIS page 5-24 says it best: "MetroRail service will deliver the highest ridership, more than twice that of Bus Rapid Transit, the highest number of new riders, more than three times that of BRT, and will result in a higher percentage of people using transit. (0013, 0013-L –24)

Public Comment: Rail option is clearly superior & needed. (0048, 0048-CC-2)

Public Comment: The owners of the Loudoun Station property would like to endorse the "Metrorail Alternative" that is proposed for the Dulles Corridor within the DEIS. Rail is the only transit option that will improve capacity of the existing roadways in the corridor with the effect of opening four new lanes in the Dulles Corridor. (0014, 0014-L –3)

Public Comment: If we are to maintain the vibrancy of Northern Virginia's economy, we must stay ahead of the traffic congestion curve. The only way to do that is to build Dulles rail now. Any delays in building rail will only drive up the cost of the project, further promote congestion, and deprive commuters of the only real long-term solution to the region's traffic and environmental problems. (0154, 0154-T –5)

Public Comment: I hope that an extension of the orange line subway, in the farther areas of No. VA., would be very worthwhile. (0063, 0063-CC-1)

Public Comment: Personally, I would like to see the (pure) Metrorail alternative developed. (0078, 0078-CC-2)

Public Comment: As it has done elsewhere, the investment in rail will enhance property values in the corridor. Rail also will encourage higher quality development and heightened economic activity in the transit station areas, which will result in higher tax revenues for state and local governments. At DynCorp, we like being near the shops and services of Plaza America and look forward to more retail offerings for our employees as result of transit-oriented development around the Reston Town Center Metrorail station. (0233, 0426-M –33)

Public Comment: I am a personnel manager for a company located in the Lake Fairfax Business Center. We know that rail is the only option that realistically will be utilized by our staff. In addition, we look forward to being able to attract a more diverse work force from distant locations, including Washington, DC. Currently, transportation options limit severely that opportunity. (0125, 0125-E –3)

Public Comment: Our statement is rather simple and precise. As a community [The Pavilion Condominiums], we recognize the enormous value and need for expanded public transit in this area. We take no exception to the intent of the Dulles Corridor Rapid Transit Project, and in general we would favor the all-rail option. (0126, 0126-E –1)

Public Comment: From a land use and transportation perspective, the Metrorail Alternative can best achieve the land use and transportation goals of the County on the Loudoun Station property. (0014, 0014-L –7)

Public Comment: I support the full rail alternative as proposed in the Draft Environmental Impact Statement providing service from Falls Church to Route 772 in Loudoun County be selected as the Locally Preferred Alternative. This alignment will best serve the region by maximizing ridership while offering convenient access to Tysons Corner, Reston, Dulles International Airport, and Loudoun County. I do not believe that any of the other alternatives proposed in the DEIS would offer our region the same level of service, convenience, and economic growth. (0418, 0418-L –1)

Public Comment: The choice needs to be for Metrorail all the way. BRT is a waste of money! Most people will not ride it, and to build it will only waste enormous sums of money and will be a huge missed opportunity. The current high level of ridership on Metro will tell you how great of a system it is. Buses will never get this, and to think they will ever do much of a dent in transportation needs in this region is a fantasy. (0110, 0110-E –4)

Public Comment: Environmental criteria are met in any of the alternatives according to the EIS; ridership levels are highest with the full metro rail option. Our goal should be to capture the highest level of ridership because of the possible air quality impacts from the use of automobiles in the out years of 10 to 20 years from now. (0287, 0287-T –1)

Public Comment: This system is greatly needed and long overdue. I feel that a Metrorail system would be the best alternative. It would be better accepted and more greatly used than a bus system. 0116, 0116-E -1)

Public Comment: We add the important argument that the rail alternative is the only alternative that is compatible with the vision for the future of the communities of the corridor, as expressed in the Fairfax County Comprehensive Plan, in the results of the recent Reston Charrette, and in many other planning documents for the Reston area. (0478, 0484-E –2)

Public Comment: The projected costs of a rail-only option are substantial, and our members will bear a large portion of the funding responsibility, including potential sales tax and real estate tax increases, as well as potential increased tolls paid by our employees and customers. This issue is of great concern to our members, including the effect on the state and region's ability to fund other, key transportation improvements. But we also recognize the benefits to the region's transportation system, particularly along the Dulles Corridor, of a rail-only system that results in the greatest number of transit riders. (0450, 0450-E –3)

Public Comment: Reston Association recommends Metrorail, with modifications, as the Locally Preferred Alternative because: Metrorail provides far greater long-term capacity. It better meets the ridership demands stemming from future commercial, residential, and airport growth and development; Providing a seamless mode of transportation, it attracts more than twice the ridership of BRT, resulting in getting more vehicles off our roads; It will contribute to the continuing vitality of the corridor; It saves money over the "Phased" alternative. Furthermore, the "Bandwagon" effect that is now occurring in support of the Metrorail Alternative increases the likelihood that the system will be built. (0233, 0426-M –2)

Public Comment: I fully support the rail system thru Tysons & along D. Corridor, both as a real estate agent to my clients and a resident of the Tysons area! (0050, 0050-CC-1)

Public Comment: Rail access to Dulles Airport is an obvious given if "International" has any meaning. We are way behind most other large International service regions and must improve our people and product distribution efficiency. We are being extremely nearsighted, however, in not planning for the near

future by suggesting that rail service be primarily on-grade in high-density (and future high-density) areas. (0441, 0441-E –1)

Public Comment: Because of the specific impact of this project on our members and all businesses in Reston, Herndon and along the Dulles Corridor, we have been very methodical in our review. We have surveyed our members in order to get their feedback on the locally preferred alternatives and received a significant response with an 11.5% return rate and an overwhelming majority of respondents favoring rail throughout the corridor. As a result of our process of surveying, committee research work and Board of Directors comment, the Greater Reston Chamber of Commerce formally supports that the locally preferred option should be rail with further enhanced bus service in the interim. (0450, 0450-E –2)

Public Comment: I support building rail to Tysons, Dulles, and Eastern Loudoun as soon as possible to help relieve traffic congestion, to provide and option to driving and to stimulate Smart Growth in the Dulles Corridor. Please build this project as soon as possible. (0381, 0381-E –1)

Public Comment: We have studied the DEIS and the various supporting technical reports and we have concluded that the "Metrorail Alternative," which we are calling "Dulles Rail Now," offers the greatest net benefits -- weighing all the many tangible and intangible benefits vs. the capital and operating costs. Or, in other terms, Dulles Rail Now is the most cost-effective alternative in terms of overall benefits per dollar of investment. Finally, we believe that Dulles Rail Now is the most important new link that should be added to the regional rail system because, in addition to directly serving the region's international airport, it will directly serve the two largest business centers of Virginia, which are also the two largest activity centers of the region outside of downtown Washington. (0478, 0484-E –3)

Public Comment: WEST GROUP PROPERTIES LLC supports the full extension of rail for the following reasons:

- The complete extension of Metrorail from Falls Church to and beyond Dulles Airport to Loudoun County will provide greatest benefits for economic growth to the Dulles Corridor and the region.
- The world's capitol of democracy should have an international airport serviced by state of the art mass transit, not by a bus system.
- A seamless Metro system will be utilized by the residents of Fairfax County to their places of employment within the Dulles Corridor. WEST GROUP PROPERTIES LLC does not believe that the same can be said for a bus/rail system that would require transfers between the two modes to reach a final destination within the Corridor. (0233, 0426-M –46)

Public Comment: WEST GROUP PROPERTIES LLC supports the full Metrorail alternative as articulated in the Draft Environmental Impact Statement that provides for the extension of rail service from East Falls Church to Route 772 in Loudoun County and we urge the Board of Supervisors to support full Metrorail as the Locally Preferred Alternative. (0233, 0426-M –45)

Public Comment: While Bus Rapid Transit provides promising ridership levels, it does not match those of rail nor does it provide the level of service or permanency needed to anchor and guide transit oriented development. In view of this we support the rail option because it will produce both the highest ridership levels and the greatest support for Smart Growth. (0142, 0219-M –3)

Public Comment: Full Metrorail should be the Locally Preferred Alternative. The BRT alternatives do not produce any real benefits. It was initially financially attractive when the Federal contribution was 80%. Now that it has dwindled to only 60% its one positive has disappeared. In fact we here already have what could be called "BRT-Light" with the current service. This can become "Neo-BRT" by having the ability of paying fares prior to boarding; increasing the frequency of service; and even putting articulated busses on the line. (0208, 0208-M –1)

Public Comment: We represent some landowner in the Tysons Corner area at the Tysons West station. About 22.5 acres altogether. These are the properties that are known as Security Storage, Templeton Oldsmobile, Cherner Lincoln-Mercury, and Peacock Buick. And it is the location also of what has been talked about this evening as the 2000-car parking garage and the temporary BRT transit stop. These four

landowners have gotten together and have looked at this analysis as a group, and have really come out in support of rail now. They are looking at a rail-only alternative and would prefer that to the BRT. (0161, 0161-T –1)

Public Comment: I support the full rail alternative, providing service from Falls Church to Route 772 in Loudoun County, as proposed in the Draft Environmental Impact Statement and Proposed General Plans for the Dulles Corridor Rapid Transit Project. Selection of full rail as the locally preferred alternative will best serve the region by not only maximizing ridership, but also by providing the most convenient access for businesses and residents to and from Tysons Corner, Reston, Dulles Airport and the rapidly growing Loudoun County. I do not believe that any of the other locally preferred alternatives would be able to provide our region with the level of service, convenience or economic growth that the full rail alternative would. (0393, 0393-L –1)

Public Comment: The full rail alternative is the only sound long-term investment that makes sense, especially considering the environmental impact of even more cars or buses on our roads. There is no time to waste in approving an environmentally friendly, full rail service alternative from Falls Church to Route 772 in Loudoun County. (0393, 0393-L –5)

Public Comment: As someone who grew up in the suburbs of New York and whose family commuted by rail into the city each day, I know how vital the Dulles Corridor Rapid Transit Project is for Northern Virginia commuters. While bus service would be less expensive and could service the same routes, there is no doubt in my mind that only rail will be utilized sufficiently to help alleviate severe traffic congestion on our roads. That is why I support the full rail alternative as proposed in the Draft Environmental Impact Statement. Service from Falls Church to Route 772 in Loudoun County should be selected as the Locally Preferred Alternative. This route will not only maximize ridership (which I predict will be much higher than forecast), but will also offer convenient access to business and residents in Tysons Corner, Reston, Dulles Airport and rapidly growing Loudoun County. (0394, 0394-L –1)

Public Comment: So what I'm arguing for is that we put aside all the issues of contention, build the rail line, get it in there, you'll find that it might only cost $300 million to do it. (0083, 0192-T –4)

Public Comment: At this Hearing we had the opportunity to get the information we were interested in by talking to a number of your representatives. We were particularly concerned with the noise levels and the location of the Station closest to our residence at Lillian Court. Based on what we heard and saw we want to go on record in support of Metrorail to Tysons and on to Dulles - the sooner the better. (0395, 0395-L –1)

Public Comment: The Northern Virginia Roundtable, a membership organization of chief executives from Northern Virginia's largest companies and institutions, supports the selection of rail as the locally preferred alternative for the Dulles Corridor Transit Project. A full rail system from West Falls Church to Loudoun County along the Dulles Corridor is our ultimate and unqualified goal. This is a policy the Roundtable re-affirmed as recently as 2000. (0396, 0396-L –1)

Public Comment: This firm represents a group of landowners at the proposed Tysons West Transit Station. These landowners control 22 acres of land and are identified as the Security Storage site, Templeton Oldsmobile, Peacock Buick and Cherner Lincoln Mercury dealerships (the "Owners"). These properties are located on the north side of Route 7. The Security Storage site and Templeton Oldsmobile dealership are located on the west side of Tyco Road, while the Peacock Buick and Cherner Lincoln Mercury sites are located to the east of Tyco Road. The Owners have been working together to analyze the various alternatives proposed in the Draft Environmental Impact Statement. On their behalf, I would like to voice their support for the Metrorail alternative over the Bus Rapid Transit or Phased Implementation alternatives. The growing traffic problems in the Tysons Corner area need to be addressed and rail provides efficient transit service. Rail is the best way to increase transit ridership and to reduce trips on the road and will also be a catalyst for planning future growth in Tysons, ensuring a vibrant transit-related mixed-use center. (0400, 0400- L-1)

Public Comment: On behalf of Tysons Corner, LLC and Tysons Corner Property, LLC (the "Owners"), the owners of Tysons Corner Center (the "Center"), and Wilmorite Property Management, LLC ("Wilmorite"), the manager of the Center, I write to apprise you of our comments and concerns about the Draft Environmental Impact Statement ("DEIS") for the Dulles Corridor Rapid Transit Project that examines the possible extension of transit service through Tysons Corner to Loudoun County. The Owners and Wilmorite are strong supporters of the extension of rail service to and through Tysons Corner. The proposed transit extension affords an important opportunity to enhance the pedestrian environment in the area and provide additional transportation options for employees and customers of the Center. We very much look forward to having a Tysons Central station adjacent to the Center. As evidence of our support, we actively are participating in the efforts of LEADER to determine appropriate funding mechanisms to construct and operate the rail service, and will continue to lend our support and counsel as necessary and appropriate. (0406, 0406-L –1)

Public Comment: The Action Committee for Transit (ACT), the voice of the transit rider in Montgomery County, Maryland, strongly supports the proposal to build rail in the Dulles Corridor to Dulles Airport. We feel that the option that will best serve the region's need is heavy rail. (0428, 0428-E –1)

Public Comment: The Chamber's commitment to increased transit opportunities and transit-oriented development remains steadfast. Like many in the community, we have supported the concept of rail service through Tysons Corner and along the Dulles Corridor, but have been without the benefit of more detailed information on the costs, impacts and alternatives that are necessary planning tools when undertaking a project of this magnitude. The DEIS gives us some of that information, and we have been reviewing and assessing the information over the past several weeks. (0450, 0450-E –1)

Public Comment: As a landowner in Loudoun County, we strongly support the provision of mass transit to Eastern Loudoun County, and are in favor of the Rail option presented in the DEIS with a station located in the median of the Dulles Greenway between the Route 607 (future Route 411) and Route 772 interchanges. Subject to the approval by the Loudoun County Board of Supervisors of the pending land use case, the Trustees have voluntary agreed to dedicate 12 acres for the transit support activities immediately to the west of the proposed Route 772 station. (0451, 0451-L –2)

Public Comment: Rail/BRT: The CMCF supports the DEIS alternatives for rail to Route 772 terminal, as it provides the highest anticipated ridership for the study area, and is consistent with the land use planning of the surrounding properties. If BRT is selected or BRT/Rail pursued, the CMCF has documented in the current land use proffers with Loudoun County that the site yield will vary. (0451, 0451-L –9)

Public Comment: At DynCorp, we think that the investment in rail is a good business decision. It is good for employers, good for employees, and good for local and state governments. Regional forecasts project that the Dulles Corridor will continue to grow at nearly double the rate of the rest of the region. With growth comes congestion. Rail is the only mode with the demonstrated capacity to handle the increasing demand for travel in the corridor. (0233, 0426-M –31)

Public Comment: Rail provides our employees with an attractive, stress-free commute option. The ability to use rail transit to get to work is an important employee amenity. It will be a useful recruitment tool and will enable use to have improved access to the regional labor pool. It will also be easier for visitors and other businesses that provide services to us to access our offices. We feel that rail transit will give our Dulles Corridor location a competitive advantage. (0233, 0426-M –32)

Public Comment: As you have heard our Chairman Ken Plum say, the Dulles Corridor Rail Association supports moving directly to rail transit in the Dulles Corridor. The demand for travel is growing. Population and employment growth in the corridor is projected to be double that of the rest of the region even without the transit related land use changes adopted by Fairfax and Loudoun Counties. Passenger trips at Washington Dulles International Airport are projected to increase from 20 million today to 37 million in 2010. The Dulles Center of the National Air and Space Museum will get three to five million visitors per year when it opens in December 2003. (0141, 0443-E –1)

Public Comment: We need rail now. This is an investment in our future not a cost. (0141, 0443-E –17)

Public Comment: We are strongly in favor of either of two options: the metrorail option or the phased option (as long as there are guarantees that the BRT portion of the phased option will eventually be converted to metrorail). Between the two, we rank the phased option higher than the metrorail option. But we would be happy with either. (0226, 0226-E –1)

Public Comment: We are strongly opposed to the other two options: combined option (metro through Tysons and BRT the rest of the way) and the BRT option. (0226, 0226-E –2)

Public Comment: I am here tonight in support of the metrorail as the alternate foundation of the Dulles Corridor Rapid Transit. (0250, 0253-T –1)

Public Comment: A first class rail system is achieved when complemented by reliable and clean bus system. Again, metro bus, with its 29 years of experience, stands tall as a proven regional provider. With the flexibility to meet demands by adding rail cars or bus runs, metrorail becomes the obvious solution to meet local growth. (0250, 0253-T –5)

Public Comment: To begin, I strongly support the introduction of Metrorail service in the Dulles Corridor. I believe that construction should begin as soon as possible, allowing for the start of rail service by no later than 2010.

This is most important because:

1. Residential And Business Development Have Increased - The rapid growth of residential and business development in the Dulles corridor can now support fast, direct, efficient and environmentally-friendly Metrorail service connecting the corridor to the Washington region's core and, eventually, to other suburban areas as well.

2. Dulles Airport Passengers Have Increased - The growth at Washington Dulles International Airport itself, as both an air service gateway to the Washington area and a major employment center in its own right, has produced additional rail passenger demand in the corridor.

3. Traffic Congestion Has Increased - Instituting rail service in the Dulles corridor is also needed to deal with growing levels of traffic congestion, notwithstanding the recent addition of more bus service connecting outlying areas to Tysons Corner and the West Falls Church Metro station.

4. Support The Summer Olympic Games - Although it is of lesser importance to the day-to-day workings of our region, it is vital that rail service be extended to Dulles Airport if the Washington region is to succeed in its efforts to win the rights to host the 2012 Summer Olympic Games. This is due to the need to ensure mobility throughout the Washington region while the Games are in progress as well as the airport's status as the primary international gateway to the National Capital region. (0071, 0214-M –1)

Public Comment: The EIS process we have been through has convinced me that, despite some very difficult challenges ahead and some questions that have not been completely answered, this project does in fact make sense and should be undertaken. Therefore, I strongly advocate the immediate development of the full Rail Alternative. I strongly urge all affected state, local, regional and federal officials to expedite their final review of this phase of the EIS, and to move quickly into the final planning, design and construction phases necessary to make the project a reality. Let's get on with building a rail transit system in the Dulles Corridor. (0088, 0211-M –20)

Public Comment: Yes, there is a considerable challenge in providing more early-year funding allocations needed to advance the Rail Alternative more rapidly than would have been required by the other options. This challenge can be met. While a highway lane has a rather finite capacity, the rail system once in

place can continue to expand ridership well beyond the demand estimates for the year 2025 used by the consultant. Therefore, because of the overall project cost savings, the greater economic benefits, the greater load carrying capacity, and the operational logic of the Rail Alternative, this option is well worth pursuing. (0088, 0211-M –6)

Public Comment: I support the "Metrorail Alternative."
A. I agree with the Dulles Rail Now Coalition statement and all the many reasons others offer (capacity, ridership, new riders, accommodation of long-term growth, mobility for all, importance of rail to the international airport serving our national capital, etc.).
B. Rail Now is the only alternative that is compatible with the future vision we have for Reston, Herndon, Tysons, and other communities.
C. Rail Now is the most cost-effective alternative in terms of benefits/dollar invested.
D. Dulles rail is a crucial link in the regional system. (0173, 0213-M –1)

Public Comment: The Trust endorses Metrorail as most desirable among the alternatives considered in the Draft EIS and recommends that rail be endorsed as the Locally Preferred Alternative. All other options are unsatisfactory. Two of the three BRT alignments provide for no station stop at Route 28. Furthermore, BRT would attract fewer than half of the total riders, and less than a third of new riders, than Metrorail. (0175, 0202-L –1)

Public Comment: We support continued efforts to complete the project, and we prefer that it be a rail only project from the start. It is clear that rail will attract the greatest number of people from their cars, and that should be the overriding criteria, to reduce vehicle miles traveled. In fact, we do not see that sort of analysis in the report and it should be included. Doing so will demonstrate the value of the project to the region. (0188,0217-M –1)

Public Comment: Reston Interfaith supports the rail option as outlined in the Draft Environmental Impact Statement. Our interest in and support of this option is not based on any expertise on environmental impact or transportation projections. Rather, it is based on our work experience and familiarity with the needs of low-income and working families in Fairfax County. We are especially concerned with the working poor who often cannot afford to live near their work site and depend on public transportation to get to and from work as well as needed social services. (0193, 0238-M –1)

Public Comment: In Reston Interfaith's review of the Draft Environmental Impact Statement, we note that continued bus service, especially on feeder lines, remains critical for low-income families, but the Impact Statement states that Metrorail will provide a better level of accessibility for minority and low-income populations (page S-24 of Executive Summary). (0193, 0238-M –2)

Public Comment: The Committee for Dulles strongly recommends that the full Rail Alternative be selected from the beginning. (0204, 0204-M –1)

Public Comment: Once again, the Committee for Dulles has steadfastly advocated rail to Dulles since the organization was first conceived more than 35 years ago. Today we strongly urge all affected state, local, regional and federal officials to expedite their final review of this phase of the EIS, and to move quickly into the final planning and design phases necessary to make the Dulles extension of the rail transit system a reality. (0204, 0204-M –15)

Public Comment: The Reston Association recommends Metrorail, with modifications, as the Locally Preferred Alternative: Metrorail provides far greater long-term capacity. It avoids a transfer from Bus Rapid Transit. It will contribute to the continuing vitality of the corridor. It saves money over the "Phased" alternative. Furthermore, the "Bandwagon" effect makes it likely it will be built. (0210,0210-M –1)

Public Comment: Our general feelings are that we need metrorail the entire way, of the system will be insufficient before it is even implemented. (0226, 0226-E –3)

Public Comment: I am in support of a Metro Rail going through the Tysons Corner area in order to promote a cleaner environment, to provide alternate transportation options for residents, and to alleviate traffic congestion. (0229, 0229-E –1)

Public Comment: Yes, there are many people who are concerned about the costs, and they are daunting. But I also would say that the problems of clean air are daunting as well, and I fear that if we don't make the effort to use all our ability to consider the rail option, we will foreclose that option for many, many future years. (0242, 0242-T –1)

Public Comment: DATA recommends the full rail alternative, Metrorail. West Falls Church to Loudoun County as outlined in the draft environmental impact statement. (0244, 0244-T –1)

Public Comment: It is said best in the report. Metrorail service will deliver the highest ridership, more than twice that of BRT, the highest number of new riders, more than three times that, if not more, than BRT, if I could add a little side comment, and will result in a higher percentage of people using transit. When more people ride transit, the air gets cleaner, and that's a very important issue for us in this region. When more people ride transit, I think the quality of life improves. Congestion is minimized for all and avoided completely by many. Property values are ultimately increased based on parallel experiences in similar projects around the country. These values go a long way to enhance the real investment capital required to make this alternative work. (0244, 0244-T –2)

Public Comment: Boston Properties, with over 15 million square feet either planned or completed in the area, is highly supportive of this system and in particular the full Metrorail Alternative. (0003, 0246-T –1)

Public Comment: We support the rail alternative because of its high capacity to move riders, because it avoids the disruptions and delays associated with the conversion from BRT to rail, and because it avoids the costs of such conversions. Rail offers the greatest opportunity to maximize ridership and to minimize vehicle miles traveled. (0248, 0248-T –1)

Public Comment: Joining with the diverse coalition today, we strongly support a rail alternative over the bus rapid transit options for the Dulles project, provided that we get the land use right. 0251, 0251-T –1)

Public Comment: It seems there's a lot of people with groups and interests, so I would like to just go on record as saying that a resident of Sterling Park, I know we've had a few other residents from the Sterling Park area, I am very much in support of this, the full Metrorail build option. (0265, 0265-T –1)

Public Comment: From what we have learned here today and from our own experience, we know that the most accessible and efficient manner of transportation, and most accessible in terms of persons with disabilities, is rail. Our colleagues in Fairfax County and in Loudoun County want to see rail all the way out to Loudoun County. (0157, 0157-T –2)

Public Comment: We support continued efforts to complete the project, and we prefer that it be a rail-only project from the beginning. It is clear that rail will attract the greatest number of people from their cars and that that should be the overriding criteria, to reduce vehicle miles traveled. (0158, 0158-T –1)

Public Comment: As a community, we [The Pavilion and The Villages] recognize the enormous value and need for expanded public transit in this area. We take no exception to the intent of the Dulles Corridor project, and in general would favor the all-rail option. (0126, 0199-M –1)

Public Comment: So Reston has much to gain from the coming of metrorail. (0141, 0167-T –2)

Public Comment: While BRT provides promising ridership levels, it does not match those of rail, nor does it provide the level of service or permanency needed to anchor and guide transit-oriented development. In view of this, we support the rail option because it will produce both the highest ridership levels and the greatest support for smart growth. (0142, 0142-T –6)

Public Comment: Finally, I recently attended the Reston charette that brought experts from the West Coast. There were three planning experts brought in to advise Reston on its future in light of these transit options. After looking at the possibilities, these independent planning experts unanimously advised the Reston community to go directly to rail for the whole corridor as soon as possible. Their expertise confirmed what many of us had come to believe, that in planning the Dulles corridor we will create the best quality of life if we go to rail. (0144, 0144-T –11)

Public Comment: The rail-only option constructed in segments as funds become available, similar to the manner in which the existing metrorail system was constructed, represents the least disruptive attractive option and preserves the opportunities for transit-oriented redevelopment. (0135, 0135-T –2)

Public Comment: For the record, I'm an attorney with Cooley, Godward in Reston, here tonight on behalf of Wilmorite Property Management, the new owner of the Tysons Corner Center. Tysons Corner Center is supportive of the extension of rail service to and through Tysons Corner. Wilmorite and Tysons Corner Center believe that rail service has the potential to create enhanced transit options for employees and customers of Tysons Corner Center. (0143, 0143-T –1)

Public Comment: I recently attended the Reston charette where three independent planning experts from the West Coast were brought in to advise Reston on its future in light of the Dulles transit options. After looking at the possibilities, these planning experts unanimously advised the Reston community to go directly to the rail option for the whole corridor as soon as possible. Their expertise confirmed what many of us had come to believe, that building seamless rail in the Dulles corridor now will create the best quality of life possible in our communities for the new century. (0144, 0190-T –4)

Public Comment: I'm here representing the Ellison Heights-Mount Daniel Civic Association, a community of 200 homes. Before I enumerate our concerns about the EIS, I would like to tell you that most of my neighbors support rail to Dulles and Tysons, believing it is critical to an effective area wide transportation network. (0145, 0145-T –1)

Public Comment: We support the rail alternative here tonight over bus rapid transit provided we get the land use right. (0149, 0149-T –5)

Public Comment: We strongly support a rail alternative over the bus rapid transit option for the Dulles transit project, provided we get the land use right. (0149, 0180-T –4)

Public Comment: Our support for the Dulles Rail project, or any transit project for that matter, has always been contingent upon real plans to focus development within 1/4 and 1/2 mile of the transit stations in high quality, new urbanist designed communities. Joining with this diverse coalition today, we strongly support a rail alternative over the bus rapid transit options for the Dulles project - provided we get the land use right. While there has been progress on addressing the land use issue, much work remains to be done. (0149, 0205-M –1)

Public Comment: TYTRAN is on record as early as 1995 with a board-approved resolution supporting rail to Dulles project. (0152, 0152-T –1)

Public Comment: The Reston Association recommends metrorail with modifications as the Locally Preferred Alternative. Metrorail provides far greater long-term capacity. It avoids the transfer from bus rapid transit. It will contribute to the continuing vitality of the region, and it saves money over the phased alternative. Furthermore, the bandwagon effect makes it likely it will be built. (0170, 0170-T –1)

Public Comment: I agree with the Dulles corridor, the Dulles Rail Now Coalition statement 100 percent, and for many of the reasons others offer for that [Metrorail] alternative. The high capacity, the ridership, number of new riders, the avoidance of transfers, the accommodation of long-term growth, mobility for all, the importance of rail to the international airport serving our national capital and so on. (0173, 0173-T –2)

Public Comment: I would add rail now is the only alternative that's fully compatible with the future vision we have for Reston, Herndon, Tysons and other communities, based on the comprehensive plan, the outcome of the Reston charette that's been referred to, and many other local plans and vision statements that we have for the area. (0173, 0173-T –3)

Public Comment: The trust endorses metrorail as the most desirable among the alternatives considered in the draft EIS and recommends rail be endorsed as the Locally Preferred Alternative. All other options are unsatisfactory. (0175, 0175-T –2)

Public Comment: I strongly support the Dulles rail project. I believe it is most important that an express rail line be extended to Dulles in the timeliest of manners. However, this is an extraordinary financial cost to the public and the citizens of Fairfax County. (0179, 0179-T –1)

Public Comment: I am for rail. Not a phased rail, but rail all the way at once. (0181, 0181-T –1)

Public Comment: Now the rail that will go out to Dulles is going to be a subway rail, not the same thing as the VRE, but rail is very successful. People like to use it. The parking lots at VRE, for instance, are just overflowing with people, and so they are voting with their parking spaces that rail is a good idea. (0185, 0185-T –1)

Public Comment: Now I realize that the Dulles Airport rail will be much more expensive than VRE because we are not renting space, we have to buy space and do the whole infrastructure bit. But, anyway, I would say that we need to go forward with rail. For many people, it will save a lot of time. You will add time to your life if you ride rail, for most people, and this translates into more time from your family and friends, and I think it is probably the best solution. (0185, 0185-T –2)

Public Comment: A metrorail connection to Dulles will permit much easier access to jobs in the corridor, as well as the airport itself, than the current system. (0186, 0186-T –5)

Public Comment: The success of the current express bus service in the corridor foretells the success of heavy rail extension, particularly since the right of way exists for most of the corridor. (0186, 0186-T –6)

Public Comment: We have a long history of supporting transit in general and have supported aspects of this project in the past. We support continued efforts to complete the project and prefer that it be rail-only project from the start. We believe that rail will attract the greatest number of people from their cars and that should be the overriding criteria, to reduce vehicle miles traveled. In fact, we do not see this sort of analysis in the report, and it should be included. (0188, 0188-T –1)

Public Comment: Reston Interfaith's mission is to promote self-sufficiency and support people in need of shelter, affordable housing, child care and other community services. Reston Interfaith supports the rail option as outlined in the Draft Environmental Impact Statement. Our interest in and support of this option is not based on any expertise on environmental impact or transportation projects. Rather, it is based on our work experience and familiarity with the need of low-income and working families in Fairfax County. We are especially concerned with the working poor who often cannot afford to live near their work site and depend on public transportation to get to and from work, as well as needed social services. (0193, 0193-T –1)

Public Comment: In review of the Draft Environmental Impact Statement, we note the continued bus service, especially feeder lines, remains critical for low income families, but the impact statement states that metrorail will provide a better level of accessibility for minority and low income populations. (0193, 0193-T –2)

Public Comment: In summary, Reston Interfaith supports the rail option, especially as it pertains to the transportation needs of lower income Fairfax County families and will continue to advocate for the need to include affordable housing in the higher density residential development that the rail option will initiate. (0193, 0193-T –4)

Public Comment: I am a director for the Reston Citizens Association. On behalf of RCA, I urge the immediate development of the Metrorail Alternative. The Reston Citizens Association has passed no less than five resolutions ranging from August 23rd, 1999 through the most recent resolution this week. The Reston Citizens Association supports development of the Dulles rail transit system as soon as feasible and urges that the Commonwealth Transportation Board and all other decision-making bodies involved in the Dulles Corridor Rapid Transit Project adopt the Metrorail Alternative as defined in the EIS. (0196, 196-T –1)

Public Comment: I support the Dulles Rail alternative for the Dulles Corridor for many of the reasons stated by previous speakers. Dulles Rail is an essential component of the region's and nation's transportation infrastructure. Also, from my perspective, the sooner Dulles Rail becomes constructed and operational, the sooner the governing bodies can shift attention to I-66 Rail extended from Vienna to Centreville, currently under environmental review. (0197, 0197-M –1)

Public Comment: It [Rail] would also be expensive, but worth it. The Washington area should always allocate enough money as it needs in a changing time. (0063, 0063-CC-2)

Public Comment: We support continued efforts to complete the project, and we prefer that it be a rail only project from the start. It is clear that rail will attract the greatest number of people from their cars, and that should be the overriding criteria, to reduce vehicle miles traveled. In fact, we do not see that sort of analysis in the report and it should be included. Doing so will demonstrate the value of the project to the region. (0158, 0223-M –1)

Public Comment: The Dulles Corridor Rail Association has shown that a commitment to "Dulles Rail Now" addresses issues that the League of Women Voters has been exploring for 40 years, that is, high quality service to the greatest number of passengers; sound land use planning that encourages mixed-use, people-friendly, transit-oriented development; and dedication to environmental quality through air and water protection measures. For these reasons we add our support to the Dulles Corridor Rail Association in their campaign for Dulles Rail Now! (0206, 0206-M –2) (0206, 0264-T –1)

Public Comment: I would like to reemphasize that the Loudoun County Board of Supervisors unanimously, nine to zero, encourages you to select the Metro Alternative and that you select Site 15 for the rail yard on the Dulles property. (0258, 0258-T –2)

Public Comment: First I would like to start by saying that we are fully in support of Metrorail rapid transit as the plan calls for. (0260, 0260-T –1)

Public Comment: I live very close to the Ballston metro. I remember Ballston 25 years ago. It has made an enormous difference. An investment of approximately $660 million in Metro has paid off in more than $4 billion worth of development. It in every measure is better. (0263, 0263-T –1)

Public Comment: The point I would make here is that Metro is not a cost, it's an investment. It's a damned good investment. And the payoff -- it's a lot of cost now, I will give you that. You need to think in life cycle costing. The initial cost is enormous. But if you do it right, the payoff -- the payoff is better than any other investment you can make. You're going to have to pay for transportation, that's a given, whether it's going to be roads and congestion, or you're going to put in the rail and you're going to eat the cost for a while, but your children will thank you for having the foresight to do it, because the payoff -- the payoff is indisputably the best option you have. (0263, 0263-T –3)

Public Comment: I am here tonight in support of Metrorail as the ultimate foundation to the Dulles Corridor Rapid Transit. I believe this because of different reasons. To begin with, Metrorail has a 98 percent reliability track record, which rates number one in the country. It is clean, safe and well governed. Furthermore, wherever Metrorail goes, prosperity follows, making it a serious asset to businesses and local economy. It is also friendly to the environment as Metrorail makes it attractive for commuters to ride in style and arrive on time, forgetting about their fossil fuel polluting vehicles. (0278, 0278-T –1)

Public Comment: Metrorail makes sense; it is safe, clean and a proven solution to rapid growth. Please get me out of pollution and traffic gridlock. (0278, 0278-T –3)

Public Comment: I support the Metrorail alternative. From what I have read, I suspect that this will be selected as the locally preferred alternative. (0290, 0290-L –1)

Public Comment: I strongly support the MetroRail Alternative which would extend Metro the length of the Dulles Corridor. Sooner the better. (0291, 0291-L –1)

Public Comment: I believe the rail option will be the most beneficial to the region. The cost to extend Metro will not go down. The sooner we commit to rail the sooner it will happen. Rail will provide the quickest option for emergency evacuation of local working residents in DC to the Dulles Corridor. In an emergency after rush hour it takes a minimum of an hour to an hour and a half to get bus drivers back. In bad weather (heavy snow, rain) rail is the most efficient and safer option. We are now a major private employment region. Many private employers do not have snow days. (0301, 0301-CC-1)

Public Comment: MetroRail now. Metro Stations will become destinations- that is dining and entertainment locations. (0075, 0075-CC-1)

Public Comment: Metro Rail now - from West Falls Church to Rt 772, through Tysons Corner and the Dulles Airport Access Road. (0039, 0039-CC-1)

Public Comment: I will not be able to attend the public hearings next week, but would like to register my strong support for the Metrorail alternative. The orange Line Metrorail is already a going concern and will provide a quick and efficient means to get to Dulles from downtown and points in between. Coming the other way, Metrorail will provide a good alternative to automobile commuting from the Dulles Corridor to Tysons Corner and beyond. (0115, 0115-E –1)

Public Comment: Here are some of the reasons LEADER supports Dulles Rail now:

- § Of all the alternatives in the DEIS, only Metrorail will deliver the capacity to meet the projected need … more than four times as many new transit trips.
- § Metrorail is projected to carry 9,600 passengers, a 60 percent increase in "person throughput" over the Dulles Toll Road which can only handle 2,300 passengers per lane per hour and BRT which has a comparable capacity.
- § Rail can accommodate growth. As demand grows, a single rail line (one direction) will be able to handle 50,000 passengers per hour using eight-car trains with three-minute headways. (0154, 0225-M –6)

Public Comment: That leaves rail to Dulles now. The Committee for Dulles strongly urges that this be the alternative selected. Only this alternative meets all the needs at Dulles airport and can serve the needs of Loudoun County. (0204, 0247-T –4)

Public Comment: I strongly prefer the metrorail alternative that provides for early construction of metrorail facilities throughout the corridor. I believe this approach is best because it addresses an already pressing transportation need. It will get us to the ultimate goal of providing rail service most quickly, and it will ultimately result in getting us to the ultimate goal at the least total project cost. Also, it will obviate the need to design, build, operate, perfect, and educate the traveling public on the use of a bus system that is destined to be replaced as soon as possible. Thus, I also hope that the immediate construction of metrorail will be determined to be the Locally Preferred Alternative. (0194, 0194-T –2)

Public Comment: I came to understand that we must take the long view in planning the Dulles corridor and that long view requires that we build rail now all the way out the corridor. (0144, 0144-T –2)

Public Comment: Whereas, TYTRAN supports the extension of rail through Tysons Corner to Dulles airport, on an alignment that includes the appropriate number of stations to encourage ridership, provides the greatest access for pedestrians, coordinates the existing roadway in Tysons Corner, provides additional parking solutions for commuters, and provides employees with the most cost-effective and time-saving mode of transportation with the fewest number of stops and transfers. (0152, 0152-T –2)

Public Comment: We're designing a mixed use project that embodies all of the elements that go into just that, a mixed use project, but it is focused on the metro station, and so we really would like to make three very simple statements tonight, and the first of those obviously is were the mixed use project designed specifically to surround the 772 metro station, we, Comstock Homes, very strongly support the arrival of rail, not just to Dulles Airport, but further into Loudoun County. (0256, 0256-T –1)

Public Comment: These are the reasons to do Metrorail, and forget BRT:

- § Metrorail service generally results in the shortest travel time, especially for reverse commute trips and those that begin and end in Tysons Corner.
- § Metrorail service will deliver the highest ridership (more than twice as much as BRT), the highest number of new riders (more than three times as many as BRT), and will result in higher percentage of people using transit.
- § Metrorail would provide a seamless "single-seat" link between Dulles Airport and the region's core, and provides facilities commensurate to the status of this international airport.
- § Metrorail service would provide a much greater increase in the capacity to move people through the corridor than either BRT or Combined BRT/Metrorail.
- § Metrorail would have higher growth potential in station areas along the corridor due to planned increases in allowable densities at rail stations, and better contributes to the objectives of adopted county master plans.
- § More members of the business community, area neighborhood residents, and civic organizations have expressed support for Metrorail than for any other choice.

Metrorail would provide the best opportunity to capture previous investment made in the regional infrastructure. (0110, 0110-E –5)

Public Comment: I leave it to others more directly involved to comment on the best alternative for the Tysons area, except to say that I hope that one of the least costly alternatives is ultimately selected. (0194, 0194-T –5)

Public Comment: When I'm going to argue for is that we just go right ahead and build the railroad from East Falls Church where I live out to Dulles, and let each individual community fight over their station and their problems on their own basis. If they don't want traffic, they don't have to build a station. If they want a wooden platform with umbrellas, they can do that. There are many issues at stake here, and they are big issues. (0083, 0192-T –2)

Public Comment: Metrorail knows transit. It has a 98 percent reliability track record, making it the number one rapid transit system in the country. Metrorail is known for its clean, safe and well-governed system. Metrorail has set the benchmark for efficiency and operations that other cities such as Atlanta and Los Angeles try to emulate. (025, 0253-T –2)

Public Comment: On behalf of Clover Sunrise Limited Partnership, owner of two commercial properties along the Dulles Airport Access Road corridor identified as Tax Map 17-3 ((8)) 5A and 5B, I would like to voice my support for the Metrorail alternative. I believe Metrorail is the best method for increasing transit ridership in the corridor. Bus Rapid Transit (BRT) or a phased BRT/Metrorail option are not suitable options due to the necessity for transfers and the projected ridership. We urge your implementation of the Metrorail option. (0413, 0472-L –1)

Public Comment: Rail now is, I believe, after thoroughly studying the document, I think I have been through that document more than anybody who is not a member of the team, is the most cost-effective

alternative in terms of benefits per dollar invested. And I feel quite confident in that judgment as a professional. (0173, 0173-T –4)

Public Comment: But in conjunction with changes in land use, Dulles rail can reduce regional traffic. Most urgent to us is connecting the Orange Line to Tysons Corner and creating the right mix of uses, including affordable housing and good pedestrian-oriented design. (0149, 0149-T –2)

Public Comment: The Draft EIS correctly states that "improved bus service can add only ten (10) percent to throughput" but MetroRail will add "sixty (60) percent to throughput". The added throughput is vital to the economy and mobility of the area. (0013, 0013-L –8)

Public Comment: Second, the Greenway supports full implementation of rail rather than a phased approach. Our reason for this is simple. If we are going to suffer disruption from construction, we want to get it over with. (0257, 0257-T –7)

Public Comment: With reference to the rail project in the Dulles Corridor, LINK recommends that the Virginia Department of Rail and Public Transportation move directly to rail rather than beginning with BRT with rail to follow. (0005, 0005-L –1)

Public Comment: I am writing as a representative of several properties in Tysons Corner, interested in and impacted by, the proposed transit alternatives between West Falls Church and Dulles Airport. The properties include tax map 29-4 ((9)) 12B owned by 8180 Greensboro LLC, Tam Map 29-3 ((15)) 12A owned by 8200 Greensboro LLC, and Tax Map 29-3 ((1)) 63B owned by Clover Tysons LP. Together these properties total 8.9 acres. These property owners support the Metrorail options as the most appropriate transit alternative. We firmly believe that Metrorail implemented now - without Bus Rapid Transit or phased implementation - is the only transit alternative which will adequately serve the Tysons Corner area. It is the best alternative for increasing transit ridership and taking vehicles off the road in Tysons and throughout the corridor. It also offers the fastest most convenient connection to both downtown Washington and Dulles Airport. (0413, 0413-L –1)

Public Comment: As others have mentioned, there is also BRT to metrorail transition issues, and as far as I am aware from articles and polls I have read, most Dulles corridor residents support and prefer rail. (0071, 0215-T –4)

Public Comment: I strongly support the full rail option. I support building the full length of it from the beginning, bypassing the BRT phase. There are many reasons for that, and there are some reasons why it is very expensive, but I still think it is the best option, and try to cover that in more detail in my paper. (088, 0172-T –2)

Public Comment: I strongly support rail, and I support rail now, as opposed to the BRT option first, and then rail. I think we currently have a very good express bus system that could be expanded. And then we could gradually go into an all-rail solution. (0284, 0284-T –1)

Public Comment: Overall, though, for reasons that are explained herein in greater detail, TMS supports the extension of heavy rail, without a BRT component, through Tysons Corner and along the Dulles Corridor. While a combination of BRT and Metrorail, either as a permanent solution or as part of a Phased Implementation plan, may have short-term financial advantages, the significant increase in ridership, cost effectiveness and seamless nature of a full rail extension seem to outweigh the benefits of combined BRT/Metrorail. In addition, the rail-only option provides the greatest amount of flexibility in the land uses and redevelopment opportunities around the transit stations, particularly in areas like the Tysons West station, which currently has low-rise, low density sprawling development that is inconsistent with transit-oriented development. Finally, we believe the construction of BRT all but removes the incentive for public officials to continue seeking means and funds to provide rail transit in the Dulles Corridor beyond Tysons Corner. Once the BRT improvements are constructed and placed into operation, they become more than mere sunk costs; they represent physical reminders of money already expended

and provide justification for not spending additional funds, particularly during times of fiscal uncertainty and shrinking federal assistance. (0135, 0391-L –2)

Public Comment: Go straight to the metro rail system. The public does not want a bus rapid transit system. (0070, 0070-CC-1)

Public Comment: Go straight to full Metro rail implementation, don't bother with BRT. (0043, 0043-CC-2)

Public Comment: I strongly prefer the Metrorail Alternative that provides for early construction of Metrorail facilities throughout the corridor. I believe this approach is best because it addresses an already pressing transportation need, it will get us to the ultimate goal of providing rail service most quickly, and it will undoubtedly result in getting us to the ultimate goal at the least total project cost. Also, it will obviate the need of design, build, operate, perfect, and educate the traveling public on the use of, a bus system that is destined to be replaced as soon as possible. Thus, I also hope that the immediate construction of Metrorail will be determined to be the Locally Preferred Alternative. (0194, 0216-M –2)

Public Comment: Rapid transit is needed as soon as possible. Skip Bus Rapid Transit! (0080, 0080-CC-1)

Public Comment: I strongly support the Rail Alternative. I support building rail for the full length of the project from the beginning, bypassing the BRT phase. (0088, 0211-M –1)

Public Comment: In asserting this position, the Committee for Dulles is very mindful of the challenge in making available greater early-year funding allocations than would be necessary if the more cautious BRT mode was implemented first. Nevertheless, because of the total cost savings over the life of the project, we urge construction of the full rail mode from the beginning. (0204, 0204-M –6)

Public Comment: As the owner/developer of property located in the Woodland Park mixed-use development located south of the Dulles Airport Access Road (DAAR) between Monroe Street and Centreville Road, I would like to state our support for the extension of Metrorail to Dulles Airport. We are in favor of developing Metrorail to Dulles over the proposal for Bus Rapid Transit or the phased implementation alternative. Metrorail will be the most effective means of reducing vehicle miles traveled in the DAAR corridor and will result in more transit ridership than other options. Metrorail will provide an efficient link to Dulles International Airport, Tysons Corner and Washington, D.C., which will encourage economic development opportunities in the corridor and mixed-use projects near transit stations. (0237, 0237-L –1)

Public Comment: Let me start out by saying that TMS Limited Partnerships is supportive and excited about the opportunity to bring transit service to Tysons Corner and Dulles corridor. But we have some concerns. First and foremost, we recommend that the draft EIS and ultimately the final EIS recommend a rail-only option, with no phased implementation of BRT. BRT facilities at Tysons West near the TMS property, whether it's part of a BRT rail option or phased implementation, are impediments to pedestrian-oriented, transit-friendly redevelopment. They are cost-inefficient, and quite frankly, eliminates the incentive to construct future rail service along the corridor. (0135, 0135-T –1)

Public Comment: The Reston Citizens Association has further resolved that there be no interim Bus Rapid Transit project prior to the implementation of the full rail system; that there be no decrease in direct bus service from Reston neighborhoods to the West Falls Church Metrorail Station; that upon completion of the Dulles rail transit system, local bus service should be expanded throughout the community, especially during the commuter hours to service the rail station; and that direct, safe pedestrian access be provided to the rail stations from all principle directions to the maximum extent feasible. (0196, 0196-T –2)

Public Comment: I would recommend that you go straight for full Metrorail implementation. Don't bother with the Bus Rapid Transit. (0043, 0276-T –2)

Public Comment: The Greenway supports full implementation of rail rather than a phased approach. Our reason for this is simple - if we are going to suffer disruption from construction, we want to get it over with. (0257, 0268-M –4)

Public Comment: I am in favor of going directly to rail rather than a BRT-to-rail option. I believe the disruption of service required to transition from BRT to rail will be detrimental to users of public transportation. (0273, 0273-L –1)

Public Comment: Rail now will avoid the problem of phased implementation. If we have phased implementation, one station will have to be the end of the line. If it's Tysons West, as has been mentioned, the DEIS calls for using much of the available land in that area for highway ramps, parking garages and drop-off areas. This land will be forever lost to smart growth development. I have heard proposals that Wiehle Avenue be the end of the line. It would face similar problems. The best solution is to go to rail immediately and avoid these impacts. (0144, 0144-T –7)

Public Comment: I wish to make a point, as far as stating that I believe that you should do the rail system now. I don't believe it will work or be beneficial to put in a bus system- the BRT system. The added expense that's needed, that causes the system to be developed, but it isn't going to have to be dropped as you finally do put in the Metrorail will be expensive. (0081, 0285-T –1)

Public Comment: Rail only- opponents of transit always argue that transfers inhibit use: don't force transfers at Falls Church! (as does any bus scheme). (0073, 0073-CC-1)

Public Comment: Rail only option, please. Interconnection with existing Metrorail system will provide seamless travel in the corridor. (0062, 0062-CC-1)

Public Comment: I most prefer Metrorail because of the possibility of an integrated system without the appearance of switching transportation modes en route. (0076, 0076-CC-3)

Public Comment: Building metrorail to Dulles Airport and beyond now completes the long-planned vision of the multimodal facility in the Dulles Corridor, using the median of the Dulles Access Road. The Dulles rail extension is the only alternative that can effectively serve Tysons Corner and provide a seamless extension of metrorail all the way from the terminus in Loudoun County through Dulles International Airport to downtown Washington, D.C. (0154, 0182-T –3)

Public Comment: Support rail in the Dulles Corridor; support a seamless system in the corridor although this may lead to two Orange Lines in the future - one to the airport and one along I-66 to Centreville and points west. Then what? (0086, 0086-CC-1)

Public Comment: I strongly support the Metrorail option in the Dulles Corridor because, number one, it serves -- it better serves the Tysons Corner area; number two, it offers seamless service connecting to the existing Metro system at West Falls Church for passengers traveling to the region's core; and number three, it offers greater capacity and will carry more passengers to ease -- better ease congestion in the corridor. (0071, 0215-T –2)

Public Comment: It [Metrorail] is the only alternative that can effectively serve Tysons Corner and provide a seamless extension of the Metrorail system all the way from a terminus in Loudoun County, through Dulles International Airport to downtown Washington, D.C. (0154, 0225-M –8)

Public Comment: Among the things that influenced my thinking and that are found in the DEIS as well are the following: One, the system that we build needs to be seamless with the Metro system. Rail is the only alternative that does that. A change of modes, meaning a change from bus to rail, within the system will lose ridership. Dulles Airport needs to be on the Metro system for the benefit of departing and arriving passengers. (0144, 0144-T –3)

Public Comment: I have listened to all the testimony at the three hearings that you have conducted. By far the most frequently expressed opinion is that we should build seamless rail now all the way out the corridor. This is the opinion that I share after 12 years experience working on these issues. (0144, 0261-T –1)

Public Comment: The Metropolitan Washington Council AFL-CIO believes that a Metrorail extension in the Dulles Corridor makes more sense than the other alternatives. It will increase transit trips by a much higher percentage than any other alternative, and thereby alleviate more traffic congestion than any other alternative in the corridor. A seamless extension of the metrorail system will not require additional transfers which drives riders away. (0186, 0186-T –1)

Public Comment: Dulles International Airport serves international and national passengers and persons with disabilities are among them. A rail option would make that more accessible. (0157, 0157-T –3)

Public Comment: I am a United Airlines flight attendant. I live in Falls Church City and fly out of Dulles Airport. I am very much in favor of having a Dulles corridor rail system. Since I travel back and forth at least once a week, sometimes twice, it would be so convenient for me to board at West Falls Church and arrive at Dulles without having to fight the traffic and parking before getting to work. (0234, 0234-L –1)

Public Comment: The metrorail project can be stopped at Tysons, which concerns us greatly. We think we need a regional system, one that goes at least to Dulles Airport and beyond. (0138, 0138-T –5)

Public Comment: Having seen the growth come here, I'm not at all against growth. To the contrary, I think growth is a natural part of life. Unfortunately, I believe our transit options have not kept up with the growth that we have had here, and I do believe, in my heart, that extending Metrorail all the way to Dulles Airport, and having a large unified system with downtown Metrorail is a long overdue proposal. I feel that it should be constructed, because I believe it will not only help people in transportation issues, but it will help environmentally, as well. (0036, 0275-T –1)

Public Comment: As a region, it is very important that we complete the Dulles connection and have all three of our area's great airports accessible by rail. If hosting the 2012 Olympic games can serve as a catalyst to make that happen, the Chesapeake Region 2012 Coalition is all for it, and we promise to do all we can to bring home the gold. (0153, 0153-T –4)

Public Comment: I support extension of rail to Dulles Airport at the earliest possible time. (0125, 0125-E –1)

Public Comment: My family has lived here in northern Virginia for eight generations. In my life I have seen much of the growth occur. The construction of Metro rail to Dulles airport is long overdue. I feel that Metro rail should be fully built…first. (0036, 0036-CC-1)

Public Comment: We need effective mass transit, Metro rail to Dulles airport is part of that solution. (0036, 0036-CC-3)

Public Comment: I just want to "go on record" as saying that the Dulles Metro Station is a great idea. Please build Metro all the way to Dulles. We may be the only major metropolitan area in the world without a train stop at our biggest, busiest airport. (0108, 0108-E –1)

Public Comment: #2) The train should go directly into the airport the way Reagan National does. People should not have to change to a bus with all their luggage, which requires waiting and getting on and off 2 systems. This extra hassle will cost riders who will take taxis or other means. The direct connection to Reagan National airport is excellent and works so smooth, that it should be copied with Dulles. (0110, 0110-E –2)

Public Comment: Dulles Airport is the crown jewel of our region. Its role as Washington's premier and international airport is secure. The globe's most important capitol deserves first class transit like Metrorail to ensure public access to its air terminal. (0175, 0202-L –4)

Public Comment: The Airports Authority is willing to donate the median strip of the Dulles access road, but the Airports Authority is looking for rail to be extended to Dulles airport. This has not been mentioned yet, and I think this is a very important point. (0144, 0144-T –8)

Public Comment: Dulles Airport is the crown jewel of our region. Its role as Washington's premier and international airport is secure. The globe's most important capital deserves first-class transit like metrorail to ensure public access to its air terminal. It is time the Dulles Corridor takes its rightful place among the preeminent thoroughfares of the world. It is time for metrorail to Dulles. (0175, 0175-T –7)

Public Comment: The members of Board of Directors of LEADER are committed to putting their resources and their position in this region on the line to make Dulles Rail a reality. The only thing they ask in return is that delays in this project be minimized and that the ultimate product serves the most people possible. (0154, 0225-M –4)

Public Comment: When one thinks about future growth in the Dulles Corridor, realizing that over the next 20 years volume on the already congested Dulles Toll road could double, and reflecting on how long it has taken for this project to reach this stage, the urgency of moving to rail as quickly as possible becomes clear. If we are to maintain the vibrancy of Northern Virginia's economy, we must stay ahead of the traffic congestion curve. The only way to do that is to build Dulles Rail now! Any delays in building rail now will only drive up the cost of the project, further promote congestion, and deprive commuters of the only real long-term solution to the region's traffic and environmental problems. (0154, 0225-M –5)

Public Comment: My feelings are simple: build it sooner rather than later…spend money on rail that will truly help with traffic for many years to come not on half a solution that will postpone the problem…put in stations at regular intervals. that will serve the largest populations, not where they are convenient to build. (0009, 0009-E –2)

Public Comment: PLEASE build this project as soon as possible. The better integrated this project is to the current Metro system, the better. We need to integrate Tysons/Dulles and downtown Washington, DC as soon as possible for business, the environment and to improve our quality of life. (0017, 0017-E –2)

Public Comment: The Herndon Dulles Chamber of Commerce, representing over 700 businesses and/or individuals in the Dulles Corridor, strongly supports the implementation of Rail to Dulles and to Loudoun County (Metrorail Alternative) as early as possible. (0027, 0027-L –1)

Public Comment: I support building rail to Tysons, Dulles, and Eastern Loudoun as soon as possible to help relieve traffic congestion, to provide an option to driving and to stimulate Smart Growth in the Dulles Corridor. Please build this project as soon as possible. (0016, 0016-E –1) (0017, 0017-E –1) (0018, 0018-E –1) (0019, 0019-E –1) (0022, 0022-E –1) (0023, 0023-E –1) (0024, 0024-E –1) (0025, 0025-E –1) (0026, 0026-E –1) (0097, 0097-E –1) (0099, 0099-E –1) (0100, 0100-E –1) (0101, 0101-E –1) (0102, 0102-E –1) (0103, 0103-E –1) (0104, 0104-E –1) (0105, 0105-E –1) (0106, 0106-E –1) (0107, 0107-E –1)

Public Comment: I am an enthusiastic supporter of Metrorail and I seriously encourage the decision-makers to implement Metrorail to Dulles as soon as possible. (0034, 0034-CC-1)

Public Comment: Please go with full rail immediately! (0068, 0068-CC-1)

Public Comment: Support starting the metro rail alternative, now (before the Olympics arrive - !) (hopefully this aids that bid) (0046, 0046-CC-1)

Public Comment: I support the rail-only option and feel the schedule should be accelerated if possible. The traffic congestion in this area will only get worse with time and the longer this project is delayed the more detrimental effect it will have in this region's economy. (0091, 0091-CC-1)

Public Comment: The American Lung Association of Virginia is in support of moving forward as quickly as possible with the development of rail in the Dulles Corridor. The American Lung Association of Virginia believes this option has the greatest potential to improve the quality of the air in the region. (0198, 0198-L –1)

Public Comment: I strongly support the introduction of rapid transit in the Dulles Corridor. I believe that construction should begin as soon as possible, allowing for the start of rail service by no later than 2010. This is most important because, number one, residential and business development have increased in the corridor. Washington Dulles International Airport passengers and employment have also increased, and last but not least, traffic congestion in the corridor has increased rather dramatically as we have -- most of us probably see day in, day out. (0071, 0215-T –1)

Public Comment: The Chesapeake Region 2012 Coalition supports rail to Dulles completed by 2012 or sooner. The existence of rapid rail transit to Dulles is in fact an important component of our mass transit public transportation focus Olympics and para-Olympics games bid. (0153, 0153-T –1)

Public Comment: Succinctly stated, the board of directors of LEADER favors the alternatives outlined in the Draft Environmental Impact Statement that will deliver the maximum level of metrorail service in the corridor as quickly as possible. (0154, 0182-T –1) (0154, 0154-T –1) (0154, 0225-M –1)

Public Comment: As a property owner in Fairfax and Loudoun Counties, I support the Dulles Corridor Rapid Transit Project. I encourage taking steps to expedite the development of the project through Tysons Corner, Reston, Herndon, Dulles Airport and into Loudoun County. I support maximizing the efficiency of the project by including the maximum number of stops/stations along the route. I think it is critical that each stop/station have maximum accessibility to encourage maximum use. (0095, 0095-CC-1)

Public Comment: Supports the extension of Metrorail to Dulles Airport. (0502, 2-01)

Public Comment: Supports building Metrorail to Tysons Corner, Dulles Airport, and Eastern Loudoun County to help relieve traffic congestion, to provide an option for driving, and to stimulate Smart Growth in the Dulles Corridor. Project should be built as soon as possible.(0503, 2-01)

Public Comment: In favor of a rapid rail system through Tysons Corner, however, it must be put underground. (0504, 2-01)

Public Comment: Supports building Metrorail to Tysons Corner, Dulles Airport, and Eastern Loudoun County to help relieve traffic congestion, to provide an option for driving, and to stimulate Smart Growth in the Dulles Corridor. Project should be built as soon as possible. (0505, 2-01)

Public Comment: Supports Metrorail.(0506, 2-01)

Public Comment: Supports Metrorail. (0507, 2-02)

Public Comment: Supports the Metrorail Alternative over the BRT Alternative. (0509, 2-01)

Public Comment: Supports and eagerly awaits the addition of rapid transit to provide access in the Dulles Corridor. Favors the alternative that would bring Metrorail through Tysons Corner, to the Dulles Corridor, and Loudoun County in the least amount of time. (0157, 2-04)

Public Comment: Supports Metrorail to Tysons Corner. (0511, 2-01)

Public Comment: The statement goes on to say the coalition supports rail now. We will work with the region's elected leadership to bring rail to the Dulles corridor by 2010, sooner if feasible. (0131, 0163-T – 3)

Public Comment: Rail only- opponents of transit always argue that transfers inhibit use: don't force transfers at Falls Church! (as does any bus scheme). (0073, 0073-CC-1)

Public Comment: I am here tonight in support of the metrorail as the alternate foundation of the Dulles Corridor Rapid Transit. (0250, 0253-T –1)

Public Comment: On behalf of Clover Sunrise Limited Partnership, owner of two commercial properties along the Dulles Airport Access Road corridor identified as Tax Map 17-3 ((8)) 5A and 5B, I would like to voice my support for the Metrorail alternative. I believe Metrorail is the best method for increasing transit ridership in the corridor. Bus Rapid Transit (BRT) or a phased BRT/Metrorail option are not suitable options due to the necessity for transfers and the projected ridership. We urge your implementation of the Metrorail option. (0413, 0472-L –1)

> ***Response:*** *Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and was considered by decision-makers in the selection of the Locally Preferred Alternative. The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignments T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Concerns of Tysons Self-Storage

Public Comment: Each of the BRT/Metrorail and Phased Implementation alternatives for Tysons Corner (T1, TT6, T9, and T4) includes the construction of an aerial bridge to convey buses from the DAAR to the proposed Tysons West Station and associated parking garage. The DEIS indicates that this bridge would be part of a 2,200-foot highway to provide BRT buses direct access to the DAAR without the need to enter traffic along Route 7 (possibly to avoid the surface transportation impacts of the adjacent 2,000 vehicle parking structure). The DEIS further indicates that the bridge would begin southwest of the DAAR across the adjacent automobile dealership property and proceed northeast across the Property in the area of the existing northeast entrance to the Tysons Self Storage facility before lowering BRT buses into the dedicated lanes of the DAAR. Our engineers have reviewed the DEIS and related exhibits and concluded that a bridge abutment would be necessary to support the bridge as it rises over and across the eastbound lanes of the DAAR. According to these same engineers, the bridge abutment most likely would need to be constructed on or near the northeast entrance to the Property to be most effective. The construction of an abutment to support the aerial bridge would disrupt internal circulation and eliminate the northeast entrance to the storage facility, which is the only one available to moving trucks and similar vehicles, the Fairfax County-owned sanitary sewer pumping station discussed below) and fire trucks. Without this northeast entrance, patrons of Tysons Self Storage would no longer be able to access their units via truck or automobile, which effectively would force Tysons Self Storage to cease operations. (0135, 0391-L –4)

Public Comment: In addition to the access concerns presented by the proposed BRT bridge, other direct challenges result from this bridge design. These challenges include the possible relocation of numerous telecommunications, storm water and sanitary sewer facilities and easements, as well as the need for construction and other easements to permit assembly of the bridge facilities. At this point, as best we can tell, the DEIS has not addressed these issues, particularly the location to which the numerous sanitary sewer, storm water and other public works infrastructure would be relocated. (0135, 0391-L –11)

Public Comment: Specifically, the TMS Property currently is burdened by some 16 public utility easements, including the location of a sanitary sewer pumping station and forced main, as well as

ingress/egress easements needed to maintain the public facilities. The location and size of these easements are shown on Exhibit D. All of these easements and related public infrastructure are directly in the path of the proposed aerial bridge and bridge abutment. There is nowhere on the TMS Property to which to relocate this tangled web of cables, pipes and similar infrastructure, either permanently or temporarily, to accommodate construction of the bridge and supporting abutment. The Property is fully developed as a storage business with seven (7) drive aisles no more that 20 feet wide separating the storage units and a perimeter driveway roughly 23 feet wide. Several of these drive aisles already have storm water management pipes that drain runoff from the west onto the Property, which is the low point for this area of Tysons Corner. Relocation of any of these utility lines and easements, including the ingress/egress easements, In order to accommodate a bus bridge would be very expensive, and necessarily would include a full displacement of Tysons Self Storage. (0135, 0391-L –12)

Public Comment: In our view, WMATA and the Project Team have not sufficiently explored or explained the impacts of the proposed BRT bridge on the existing utility easements on the TMS Property. Indeed, our communications with the Fairfax county Department of Public Works and Environmental Services have indicated the County would find the proposed BRT Bridge alignment and location unacceptable. Accordingly, the Project Team should consider alternative designs that avoid the need to disrupt these utility lines and the taking of the TMS Property. (0135, 0391-L –13)

Public Comment: How did/does the Project Team plan to address the substantial numbers of critical utility lines and associated easements located on the TMS Property: through relocation or simply ignoring them? (0135, 0391-L –21)

Public Comment: Has the Project Team determined the extent of the actual area needed for the ground and aerial easements, as well as for construction clearing, grading and staging? If so, what are they? (0135, 0391-L –22)

Public Comment: As is evident from the map attached as Exhibit A, the Property's single access route to a public street is via a fire lane that begins at Route 7 and runs through the middle of Koons Toyota and along the edge of the body shop for the Templeton Oldsmobile to the south. Tysons Self Storage does not own this access road but is the beneficiary of ingress/egress easements from Toyota Motor Sales USA. Inc., the owner of the Koons Toyota property (the "Toyota Property"), and Templeton and Templeton Partnership, the owner of the Templeton Oldsmobile property (the "Templeton Property"). A copy of the ingress/egress easement is attached as Exhibit C. Thus, in order to access Tysons Self Storage, patrons must cross the Toyota Property and the Templeton Property; there is no other ingress/egress available. From the Templeton Property, the storage facility property has two entrances. The entrance in the southwest corner can accommodate only automobiles, small trucks and SUVs due to the narrow entranceways and passages. The northeast entrance is the only area able to accommodate storage trucks, moving vans and similar large vehicles delivering or picking up stored materials. Because of the narrow drive aisles between the rows of storage units, the northeast entrance also facilitates internal circulation within the Property in conjunction with the perimeter driveway. Construction of transit-related facilities or any other activity that has the effect of shutting down or restricting the use of either the perimeter driveway or the northeast entrance will prevent all types of vehicles - cars and trucks alike - from circulating through the Property and accessing the storage units. (0135, 0391-L –3)

Public Comment: Based on our analysis of the Property and the information contained in the DEIS and associated Technical Reports, we believe the BRT bridge structure represents and unwise and unnecessary physical invasion and full taking of the Property. Moreover, even though the DEIS suggests that the bridge infrastructure would be interim in nature under a Phased Implementation approach and could be removed entirely once BRT service is replaced with rail in future years, we highly doubt that the bridge and related facilities ever would be dismantled. More importantly, though, the impact of the bridge on TMS and the Property is permanent once construction of the bridge commences; displacement of Tysons Self Storage is not an interim condition. (0135, 0391-L –5)

Public Comment: Further, the acquisition of the adjacent Templeton Property, on which a parking structure and stormwater management facility would be constructed under the DEIS, would terminate the

access easement rights available to TMS. In other words, the acquisition of the Templeton Property would land lock the TMS Property, effectively terminating the Tysons Self Storage business. (0135, 0391-L –7)

Public Comment: Concerned that a proposed aerial bridge from the proposed Tysons West Station to the DAAR to serve BRT buses in the Phased Implementation and BRT/Metrorail alternatives would restrict access and have a substantial economic impact to the Tysons Self Storage facility and TMS. (0135, 2-01)

Public Comment: Concerned that construction of the subject BRT bridge as part of the Phased Implementation Alternative would result in a complete taking of the TMS property. Believes that it would be nearly impossible to construct the BRT bridge that would not impact both the circulation and the operation of the Tysons Self Storage buildings. (0135, 2-02)

Public Comment: Refers to page 440 of the *Public Hearings Report*, which indicates that only the TMS property (Parcel 11) would be affected by the surface and aerial easements for the BRT bridge. This precludes relocating any portion of those easements to adjoining properties in a manner that would permit the TMS property to continue operating Tysons Self Storage as a going concern. Questions how the Project Team can retain flexibility to not restrict access to the TMS property while, at the same time, preclude relocation of the easements to adjoining properties. States that there is no flexibility if no other options exist. (0135, 2-03)

Public Comment: Again requests confirmation that no bridge would be constructed across the TMS property if the Metrorail Alternative is selected as Locally Preferred Alternative. Stated that the response on page 487 of the *Public Hearings Report* did not answer his question. (0135, 2-04)

Public Comment: Our primary concerns, though, relate to the devastating impact of a potential aerial bridge that would connect the Tysons West transit station to the DAAR as part of several BRT and Metrorail alternatives. Attached as Exhibit B is a graphic included in the DEIS showing the location of the proposed road and BRT bridge. Construction of the proposed BRT bus bridge would displace Tysons Self Storage and result in an complete taking of the TMS Property. To avoid such a devastating effect, we contend that the locally-preferred alternative for the Tysons West station should be a design that minimizes impacts on existing businesses, is cost effective and provides the greatest potential for transit-oriented redevelopment. (0135, 0391-L –1)

Public Comment: Further, we suggest that, if a connection to the DAAR must be constructed to serve BRT/Metrorail facility at Tysons West, consideration be given to locating these facilities offsite in a manner that does not affect the use, operation and viability of Tysons Self Storage and the TMS Property. (0135, 0391-L –9)

Public Comment: The DEIS indicates, and WMATA officials have stated, that the proposed road and aerial bridge from the Tysons West Station parking garage to the DAAR is only provided under the BRT/Metrorail and Phased Implementation alternatives. Accordingly, our understanding is that the bridge would not be constructed under the Metrorail alternative. We would appreciate confirmation of this since some of the drawings in the General Plans leave this question open. (0135, 0391-L –19)

Public Comment: We also have concerns that the DEIS does not explicitly address whether the proposed bus bridge is to be constructed to serve the parking structure if the rail-only option is selected. As noted below, we request that WMATA clarify the scenarios under which the bus bridge is to be constructed as part of the "intermodal" facilities planned for the rail-only Tysons West station. (0135, 0391-L –10)

Public Comment: Generally notes that many of the comments addressed in the *Public Hearings Report* received only cursory responses as part of the Project Team's analysis and important issues remain open-ended and unresolved. Believes that the Project Team should have responded to his comments in a more comprehensive fashion. As an example, the commenter states that the Project Team defers an

investigation of the relocation of the BRT bridge to the Preliminary Engineering stage, well after the Locally Preferred Alternative is selected. (0135, 2-06)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS. Therefore, the Project is no longer affecting the TMS Property nor Tysons Self-Storage.*

Need for Passenger Amenities

Public Comment: The most frequent outbound destination for riders along the new rail line will surely be Dulles Airport. In light of this, the following measures are necessary: Install overhead luggage racks in the rail cars that will be operated on the new line. Today, a passenger with luggage on a crowded train often hinders the movement of other passengers. You should assume that rail will be popular with Dulles flyers and plan accordingly now. (0290, 0290-L –4)

> ***Response:*** *The most frequent destination of the selected LPA, the Metrorail Extension, will be Tysons Corner. Metrorail vehicle technology was described in Section 2.3 of the Draft EIS. Other than the Dulles Airport Station itself, it is not anticipated that Metrorail stations or trains on the Orange Line, or elsewhere on the Metrorail system, will incorporate facilities specifically intended to accommodate airport passengers with luggage. However, station facilities already in place, such as the accessible fare gates and oversized elevators, do provide some accommodation for passengers with luggage.*
>
> *The Dulles Airport Station design is presented in the final General Plans (Final EIS Volume V). This station will have a direct underground connection to the main terminal, and will have a special wide platform to provide plenty of space for passengers with luggage. Space has been allocated in this station for airport information, additional accessible fare gates, and luggage cart rental and return immediately adjacent to the station entrance.*

Potential Greenway Impacts

Public Comment: The impact of this mass transit project on the greenway goes far beyond the simple concept of using existing greenway median for rail lines. The construction impact, relocation of travel lanes, operational impacts, use of extensive portions of greenway land for storm water management ponds, transfer power switching stations, tie breaker stations, rail control rooms, above-grade pedestrian walkways, utilities such as electrical, water, telephone and fiber optic cable, are a major source of concern for the Greenway. (0257, 0257-T –1) (0257, 0268-M –1)

Public Comment: Consequently, although the greenway recognizes its commitment to make existing median available for mass transit for this project, nothing beyond the use of the existing median can be taken for granted. (0257, 0257-T –2) (0257, 0268-M –2)

Public Comment: Storm water management ponds, tie breaker stations, transfer power switching stations and the like, should be relocated on land acquired by the project sponsors outside the Greenway right of way. If the redesigned project cannot eliminate all these impacts other than the use of the existing median, the Greenway as a private property owner would expect to be compensated for any use of its land. (0257, 0257-T –5)

Public Comment: Do not be held hostage by TRIP. It was required of the Greenway when they received their franchise that they provide for Metrorail in the median. This commitment must be upheld. (0013, 2-08)

Response: *The Comprehensive Agreement between TRIP II and the State Corporation Commission of the Commonwealth of Virginia requires that TRIP II dedicate the median of the Dulles Greenway to rail. As stated by the Project Team in a separate meeting referenced above, this dedication of the median of the Dulles Greenway will have attendant effects, some of which TRIP II must bear. These effects will be considered as DRPT continues its coordination with TRIP II on the Project's overall effects to this private toll road and on the development of a comprehensive agreement for the Project. The Project Team can clearly respond that the Project cannot be solely within the existing median and therefore will require the relocation of Greenway lanes at the Route 772 Station, Route 606 Station, and the junction of the revenue tracks with the yard lead tracks.*

During preliminary engineering of the Full LPA, a Metrorail Extension, a master agreement will be negotiated between the DRPT and TRIP II, with WMATA as a signatory. These agreements will specify the rights and responsibilities of the various parties concerning the parameters of building, operation, and maintenance of the Metrorail Extension.

The locations shown in the final General Plans for stormwater management ponds are preliminary and will be further evaluated as the engineering proceeds to determine their final locations. Efforts will be made to minimize impacts to the adjacent areas in terms of their location and to provide safe access points for all facilities in conformance with applicable design criteria. The ancillary facilities of Traction Power Substations and Tie Breaker Stations were relocated outside of the Dulles Greenway right-of-way onto private land or Dulles Airport property.

Need to Eliminate Beltway Clearance Considerations

Public Comment: The need for added Metrorail investment to provide more Beltway clearance is not valid (identified as continuing coordination in Section 7.4.8). Eliminate this extra, unnecessary cost. It is agreed there is no room to widen the Beltway. It is not an economically viable project. Do not provide for it unless VDOT fund the added cost, or unless VDOT agrees to restore the I-66 median for transit that they improperly took a few years ago despite official protest. (0013, 2-07) ***Response:*** *The Metrorail alignment will be higher in its crossing of the Capital Beltway in anticipation of a future three-level reconfiguration of the Route 123 interchange.*

Comparison of Highway Widening to Mass Transit

Public Comment: Questions the cost comparison of widening the Dulles Toll Road to building the Metrorail Alternative. Concerned about the expense of acquiring buildings and land for Metrorail. Questions whether the Dulles Toll Road could be widened to the equivalent capacity anticipated from the Metrorail Alternative without raising tolls? (0464, 2-02)

Response: *The Project Team developed and evaluated Build Alternatives for the Dulles Corridor Rapid Transit Project that were transit improvements. The widening of the Dulles Toll Road would be considered a roadway project, and has been therefore beyond the scope of this transit project. In additional, there is little, if any, available land on either side of the Dulles Toll Road to accommodate an additional lane of traffic or enough lanes to carry the capacity of the Metrorail Alternative.*

Need to Resolve Outstanding Issues

Public Comment: Concerned with the number of outstanding issues still remaining in the corridor. A process is needed to resolve these issues and coordinate with stakeholders and agencies throughout the design process. The Board of Supervisors should be involved in the design process. (0387, 2-01)

Response: *The Project Team will continue to coordinate with VDOT, MWAA, and the counties to resolve any outstanding issues during preliminary engineering. The Fairfax County staff has participated in the Project via the Technical Working Group of agencies and jurisdictions, via the public hearings on the Draft EIS and Supplemental Draft EIS and via the post-hearing conference on three Project facilities. The Project Team has briefed the Transportation Committee of the Fairfax County Board of Supervisors and participated in its hearings on Comprehensive Plan amendments and a transportation improvement district.*

Overcrowding Issues

Public Comment: How will all of the people who take DartRail into West Falls Church fit onto the overcrowded Orange Line trains? (0489 2-01)

Response: *To meet market demand, WMATA has a Capital Improvement Plan (November 2002) for Metrorail system capacity and service reliability. The CIP will increase train consists from six to eight cars, reconfigure the Blue and other Lines, and change the headways of all Lines, other than the Red Line, from six to seven minutes. As a result, the number of cars through the Rosslyn portal will be increasing. In 2004, the number of inbound Orange Line cars through the Rosslyn portal during the peak hour is 120. In 2011, with the opening of the Wiehle Avenue Extension, the number of cars, including those of the new Extension, will increase to 140 cars in order to satisfy higher ridership due to growth and to the Extension. The 20 additional cars will be procured by the WMATA Metro Matters program and by the Project.*

As described in Section 6.1 of the Final EIS, WMATA measures train loading by passengers per car (PPC) and by the number of passengers 'passed-by' on the platform, i.e., passengers unable to board a crowded train. WMATA has an objective of 120 PPC during the peak hour. WMATA operation planners estimate that the Orange Line PPC is currently 100 PPC, at the point where the trains have maximum loading - between Courthouse and Rosslyn. Table 6.1-12 of the Final EIS indicates that this loading will increase to 107 to 124 PPC in 2011 with the opening of the Wiehle Avenue Extension. (The maximum load point moves between Rosslyn and Foggy Bottom). Thus, the above addition of 20 cars will not match the higher ridership, but the train loading will be near the WMATA objective of 120 PPC. Beyond 2011, WMATA will continue to procure new cars to meet the market demand; thus, more and more trains will be eight-car consists.

Compliance with Americans with Disabilities Act

Public Comment: What type of vehicle will be used and how will access for persons with disabilities be provided and maintained? (0157, 2-02)

Public Comment: The selected alternative must be fully accessible to and usable by persons with all types of disabilities. All new transit facilities and vehicles should be accessible in accordance with federal statutes under the Americans With Disabilities Act of 1990. (0157, 2-03)

Response: *The selected LPA is the Metrorail Extension. The vehicle will be a Metrorail car. All Project facilities and Metrorail cars will comply with ADA Accessibility Guidelines.*

Park-and-Ride Capacity and Access at Stations

Public Comment: Concerned about parking at Tysons West, Route 606 Station, and especially the lack of parking at the Route 772 Station. Coordination efforts should also include Fairfax County. (0141, 2-01)

Public Comment: Requests that the Project Team look at the unconstrained parking demand at Tysons West. The commenter requested this information in his public comments, but it was not included in the *Public Hearings Report*. Also need to analyze unconstrained parking at other stations. (0387, 2-05)

Public Comment: States that the project has failed to provide sufficient parking at new stations and makes wild assumptions regarding bicyclists and walkers. (0112,2-16)

Public Comment: Desires additional surface connections to/from the stations. They would obviate any limitation imposed by the available parking at the stations. (0255, 2-04)

Public Comment: The parking issue was never confronted. Parking shown is inadequate to support ridership projections. (0162, 2-10)

Public Comment: I do have 2 major concerns: 1. Parking and Access: Will I have to pay to use the Dulles Toll Road to get to the new Dulles Metro stop? Will there be enough parking? Lots of folk who would normally use Vienna, like me, would turn to the Dulles stop. The WMATA should have a good idea of what the rider numbers are and how they "normally" change over time before plans are laid and carried out. (0108, 0108-E –2)

Public Comment: Adequate multistory parking facilities will be needed at each facility station - Wiehle, Reston, Monroe, and CIT Route 28. (0043, 0043-CC-4)

Public Comment: The system is going to be sharply limited by the amount of parking you put in. I'm personally familiar with the scrambles that WMATA has been making to get parking on the Orange Line, simply to get more people on the system. (0255, 0255-T –6)

Public Comment: Take a more detailed look at parking at all stations, particularly the end stations, to determine if the parking needs and particularly the Reston Town Center and at the other end of 772 are sufficient to meet future needs. (0244, 0244-T –7)

Public Comment: It is essential that there is a sufficient parking. It is impossible to find parking at the Vienna & Dunn Loring Metro Stations. Transit ridership would increase if there were sufficient parking. (0039, 0039-CC-2)

Public Comment: Adequate metro/rail station parking garages needed! (0046, 0046-CC-3)

Public Comment: We note, however, that the proposed 2000-car parking structure proposed for the Tysons West station under every rail option, represents a self-defeating aspect to the transit plans in certain respects. It invites additional substantial traffic to the intersection of Tyco Road and Route 7, which already has a level of service F during both the AM and peak periods, while creating a physical barrier to pedestrian-friendly, transit-oriented redevelopment. (0135, 0135-T –3)

Public Comment: We request that parking demand be projected into the future at the various transit nodes along with a financing and land use plan, based on the experience in the I-66 corridor. (0162, 0162-M –22)

Public Comment: Why are there only 13,000 or so parking spaces planned for the entire line, but you estimate 33,000 new riders? How can you provide sufficient ridership without enough parking? (0112, 0382-L –9)

Public Comment: Based on the limited information available, it's clear that the surface facilities proposed for nearly all of the stations are inadequate to meet the projected demand. It seems unbelievably foolish to spend up to $3.3 billion on a transit system only to have its potential artificially constrained due to a shortage of parking and bus facilities which are comparatively inexpensive. If we learned anything in the planning of the first 103 miles, it was the realization that adequate parking, especially in the suburbs, is essential if the transit system is to be effective in attracting riders. Reassess the station programs needed to accommodate the projected demand and provide the facilities necessary. (0387, 0387-L –10)

Public Comment: I have to take and pick up my daughter at the West Falls Church Metro Station each

day this summer because there is not one parking space available due to the heavy use of the present Metro system. I certainly hope ample parking will be provided in the final plans and that the stations will be designed to be attractive and convenient. (0394, 0394-L –2)

Public Comment: There is a major need for adequate multi-deck parking facilities at stations that would serve either the BRT or rail options. I am surprised that the Draft EIS does not provide for such facilities as part of each station. The Metro Rail system is a classic example of inadequate parking being provided at various stations. This, in turn, has meant the system's management has played catch up over the years to build the parking facilities that could have been built years ago. While some might argue initial ridership projections did not support larger parking facilities at Metro Rail stations, that should not be the case for the Dulles Corridor project. Metro Rail's experience and your rider ship projections should be evidence enough that adequate parking facilities should be part of the initial construction. (0401, 0401- L-4)

Public Comment: Tysons West Station - Metrorail & BRT Options. As stated earlier, the amount of parking provided at this stations seems to be significantly less than the projected parking demand. Why? It's foolish to constrain the ridership potential of the transit system simply because insufficient parking is provided. The parking supply should be equal to the projected parking demand at a minimum and based on WMATA's experience at other suburban stations, provision should be included in the plan for additional future expansion. (0387, 0387-L –42)

Public Comment: We have banked a lot of density credits in ground level parking and only a few in trees. Build parking structure, save the trees. (0170, 0170-T –15)
Public Comment: County and Reston Center for Government and Industry Architectural Review priorities should be to maintain or improve the visual quality of the station areas. We have banked a lot of density credits in ground level parking and only a few in trees. Build parking structures, save the trees. (0210, 0210-M –9)

Public Comment: Adequate structured parking has been a problem in some of the less planned stations. Let's not let it be a problem here [in Reston]. (088, 0172-T –7)

Public Comment: Adequate multi-story parking facilities will be needed at each Fairfax and probably Loudoun facility, such as Wiehle, Reston, Monroe, CIT, Route 28. Without those, people won't be able to get to it. 0043, 0276-T –4)

Public Comment: Adequate structured parking must be planned at each station from the very beginning of the rail transit extension. All affected jurisdictions must work closely with VDRPT, VDOT and WMATA to plan effectively for adequate structured parking opportunities at all transit stations. Parking needs will vary from station to station. The Reston Town Center station and the Route 772 station in Loudoun County may serve primarily as destination stations with limited opportunity for long-term commuter parking. Nevertheless, the parking needs of these station areas must be given special attention. The language in the Loudoun County Comprehensive Plan that specifically prohibits transit related parking at the Route 772 station even though this station is the system's terminal station in Loudoun County particularly concerns me. While it is understandable that commercial, residential and public uses should be emphasized at this station, the total prohibition of transit-related structured parking at this location will prove detrimental to reasonable access to the transit system, and result in serious "bootleg" parking violations in the neighborhoods surrounding the station. (0088, 0211-M –14)

Public Comment: Finally, we would like to see a realistic estimate of the increase in parking demand that will be associated with implementation of BRT and/or expansion of rail service [at West Falls Church]. (0145, 0452-E –10)

Public Comment: Parking At Route 772 and Reston Parkway Stations - Although I assume that it was an oversight, the Draft EIS showed no significant amount of parking at either the Route 772 or the Reston Parkway stations [for T6]. It is inconceivable to me that these two major stations in the Dulles Corridor would not require at least 2,000 parking spaces each, particularly given the rate at which Metro is adding

new parking garages to its current stations. And whether it is due to an oversight or not, this omission should be corrected prior to the next step in this process. (0071, 0214-M –4)

Public Comment: We urge both affected jurisdictions to work closely with VDRPT and WMATA to plan effectively for adequate structured parking opportunities at all transit stations. Parking needs will vary from station to station. The Reston Town Center station and the Route 772 station in Loudoun County may serve primarily as destination stations with limited opportunity for long-term commuter parking. Nevertheless, the parking needs of these station areas must be given special attention. We are particularly concerned by the language in the Loudoun County Comprehensive Plan that specifically prohibits transit-related parking at the Route 772 station even though this station is the terminal station in Loudoun County. While we agree that commercial, residential and public uses should be emphasized at this station, we believe that the total prohibition of transit-related structured parking will prove detrimental to reasonable access to the transit system, and result in serious "bootleg" parking violations in the neighborhoods surrounding the station. (0204, 0204-M –11)

Public Comment: More Parking At Tysons West Station - As the only proposed Dulles Corridor Metrorail station east of Wiehle Avenue that would have any parking, I believe that the projected number of parking spaces at the Tysons West station (1,960) will be inadequate to meet the expected demand [for T6]. This will be the closest station with parking for a large number of people who live in the general vicinity of Tysons Corner as well as those who live north of the Dulles Airport Access Road and east of Reston. For this reason, I would suggest that at least 3,000, and perhaps 4,000 or more, would be a better number of parking spaces at this location. (0071, 0214-M –5)

Response: *Table 6.3-3 of the Final EIS describes the Project's park-and-ride program. The selected LPA is a Metrorail Extension that has the following park-and-ride capacities:*

STATION	*SPACES*	*YEAR*
Tysons West	*500*	*2011*
Wiehle Avenue	*2,300*	*2011*
Herndon Monroe	*3,500*	*2015*
Route 28	*2,000*	*2015*
Route 606	*2,750*	*2015*
Route 772	*3,300*	*2015*
Total	***14,350***	***2015***

These park-and-ride facilities are in structures, as shown in the General Plans.

The Project Team did look at unconstrained demand for parking at all stations and then adjusted this parking capacity based on site constraints, land use plans, and cost. Consultation with local government was also an integral part of the sizing of parking facilities. The estimated unconstrained demand for park-and-ride at Tysons West Station is over 2,000 spaces. The actual number of spaces planned at Tysons West is 500 spaces. A park-and-ride facility was not included at the Reston Parkway Station because the Fairfax County Comprehensive Plan discourages parking at that station, and because of space constraints.

The results of travel demand forecasting show mode of arrival for each station in the corridor. These forecasts show that there are large numbers of passengers accessing stations by walking, cycling, bus and Kiss & Ride. The higher number of trips also reflects the fact that automobiles may carry more than one passenger and that a space may be used more than once during the day. All stations will be accessible from the local street network so riders will not have to use the Dulles Toll Road to access stations. With regard to walk/bike access to stations and the number of passengers accessing stations via this mode, the demand forecasting model takes into account the quality of access paths, distance to the station, and population and employment densities. The modeling process for calculating pedestrian and bike access is based on experience in the Washington region as well as from rail projects throughout the country.

Public Comment: It's very unclear how the station facility programs were developed. The Travel Demand Forecasting technical report appears to assume a predetermined parking program without any regard to the parking demand projections presented in the appendix. The technical report appendix presents parking demand projections but no information is provided as to their derivation. The number of parking spaces proposed for each of the park & ride and kiss & ride facilities appears to bear very little relationship to the parking demand numbers included in the ridership technical report appendix. (The technical report appendix doesn't say whether these demand figures are constrained or unconstrained by the parking supply). There is slightly more information provided on the bus bay program but not enough information is provided as to how the number of routes serving a particular station relates to the number of bus bays provided. (0387, 0387-L –9)

> ***Response****: Design of the park-and-ride facilities at each station was based on an iterative process. Unconstrained demand for park-and-ride was first estimated utilizing the demand forecasting model. Given this understanding of demand, concept facility programs were developed that attempted to meet this demand. However, other considerations besides demand played a role in the program development. This included site constraints, overall cost, and local land use plans. Once initial programs and park-and-ride capacities were developed, new demand estimates were developed to reflect the fact that people driving may be able to go to another park-and-ride facility if their first choice is full. Provision of bus facilities followed the same process. Wherever space availability allowed, an attempt was made to provide a bus bay for each service to a station (for the purposes of passenger convenience). If this was not feasible, the most bays possible short of this number were provided.*

Route 28 Station

Public Comment: Questions the methodology used for determining ridership and parking requirements at the Route 28 Station. He states that the response to comment on page 322 of the *Public Hearings Report* does not quantify the component of the potential total station ridership that would originate from the North Centreville-Chantilly area. This quantification is necessary to avoid underestimating ridership requirements including the number of current Metro riders that would forego a commute to Vienna metro accounting for a shifting of existing riders between stations as well as riders new to Metro. Would like further explanation on how the Draft EIS methodology accounts for these variables. (0483, 2-01)

Public Comment: THE 28 STATION DESERVES MORE SCRUTINY. The DEIS fails to recognize that the Route 28 station would benefit commuters living in Northern Centreville and Chantilly about 5 miles from the station. As a result the DEIS may underestimate potential ridership and parking requirements. These commuters will no longer have to drive 12 miles to Vienna Metro. The FEIS should recompute ridership and parking requirements for the Route 28 station in light of usage from existing communities in Northern Centreville and Chantilly. (0197, 0197-M –2)

> ***Response****: The demand forecasting model estimates ridership at each station based on total population in the vicinity of stations and total travel times to passenger destinations. This travel time includes time spent accessing the station (which incorporates distance and speed), time spent waiting for the train or bus, the time spent on the train or bus itself, and time accessing the final destination. If the total travel time from Route 28 for potential passengers from Chantilly and northern Centreville is competitive with, or better, than the same trip from the Vienna station on the Orange Line, this will be reflected in the number of riders utilizing the Route 28 Station.*
>
> *Specifically, the demand forecasting model utilized for the Dulles Corridor Rapid Transit Project relies on a range of variables that are used to determine the number of trips that will be made on the new transit line, as well as what station will be used to access the rapid transit line. The most important variable in this range of variables is total travel time from origin to final destination.*
>
> *Travel time is calculated based on a number of factors. The travel demand forecasting model contains an electronic version of the entire transportation network in the Washington region. For*

the roadway network, a travel speed and travel time is calculated for each link in the network based on the type of roadway the link is (i.e., local street, regional arterial, limited access highway, etc.), roadway capacity, and traffic volumes. Further, the region is divided into Transportation Analysis Zones (TAZs), which are geographic units that have relatively standard populations relative to one another. The number of trips made to and from a TAZ is based on the mix of land use (residential versus commercial), the total number of jobs, and the total residential population in the TAZ. For each trip generated from a TAZ, the model analyzes a series of alternative paths to the final destination and then selects the shortest path (based on travel time) to the destination. In the first iteration of this process, trips are assigned to mode such as automobile or different modes of transit. In the second iteration rail transit trips are further broken out by mode of access and access point (mode of access includes auto, bus, bike, pedestrian. The access point is the station where the trip boards Metrorail.

This process of evaluating shortest path is done for each trip being generated from TAZs in the North Centreville-Chantilly area. This means that for those trips that will utilize the proposed transit system, the model will analyze the shortest access path to the Metrorail system. For passengers in the North Centreville-Chantilly area, this will include an analysis of accessing the Orange Line at Vienna versus alternative Dulles Line stations, including Route 28. The access point with the shortest travel time path for the trip will be selected by the model (it should be noted that the total number of trips to each station by automobile will be constrained by the parking capacity at each station). This same shortest path methodology is applied to each trip generated in the region, and has been tested and validated in previous uses of the regional model as well as on rail projects throughout the United States. For the Draft EIS, the model results for North Centreville-Chantilly show that 48% of rail trips generated from the area will go to Herndon-Monroe, 35% to Route 28, and 17% to Route 606.

Reston Parkway Station

Public Comment: Over the years many Reston organizations have endorsed “four corners access” in Reston. The commenter would like to see more work done to provide this access. Would like a see a statement leaving open the opportunity to work with Fairfax County, and would like to see more work being done. What specific changes in the currently designed station make feasible these options in a phased development program? (0141, 2-03)

Public Comment: We should locate the station at Reston Parkway in such a way that it can capitalize on all the existing real estate that the international center and the Sheraton and Plaza American and Sallie Mae represent. Thus far, we are a little bit too far away from that. (0171, 0171-T –2)

Public Comment: Requests (as originally stated on page 476) that the project team evaluate several options for providing “four corners access” to the Reston Station. (0494 2-01)

Public Comment: Provided a benefit-cost analysis to the project team, which demonstrates that the “four corners access” would yield large benefits, contrary to the response on pages 476 and 477 of the *Public Hearings Report*. (0494 2-02)

Public Comment: There are three basic options, in decreasing order of priority, for achieving "four corners access" at each of the three stations (all assuming movement of the platforms as close as possible to the bridges):

1. Access under the bridges
2. Access over the bridges
3. Access at a signalized crossing on the bridges

The sketches that follow show how each of these three basic options might be achieved at the Reston Parkway station. In each of the three options, the eastern end of the platform would be moved eastward about 300 feet or slightly more, bringing it within slightly more than 400 feet of the existing Reston

Parkway bridge. This can be done without modifying any of Metro's critical standards described above, but may require slight changes in highway standards for clearances and shoulder widths near the bridges. Exhibit 1 shows the recommended approximate new location for the Reston Parkway station platform, the two mezzanines, and the new pedestrian connections on both sides of the Reston Parkway bridge. All three of these basic options listed above would have essentially the same plan view as shown in Exhibit 1. Note that the currently planned pedestrian connections to the west mezzanine would not have to be changed for any of the three options. Exhibit 2 shows the profile view of the recommended new station configuration for Option 1, which would provide access to the station to and from the east side of Reston Parkway by way of a pedestrian walkway under the Reston Parkway bridge. Note that this option involves lowering the new track profile by about 20 feet under the existing Parkway bridge in order to provide vertical clearance under the Reston Parkway bridge above the trains for the pedestrian connection. This would require reconstruction of the center pier supports for the bridge and construction of substantial retaining walls for the depressed track section for over 1000 feet. What has been ignored in this exhibit is the need to reduce costs by balancing cuts and fills, which might require raising the track profile somewhat at both ends of this exhibit. Exhibit 3 shows the profile view of the new station configuration for both Options 2 and 3, which would raise the new track profile to make access to the east side of the Reston Parkway bridge easier if such access could be better provided at grade through a new signalized pedestrian crosswalk in the middle of the bridge, or by way of a new pedestrian overpass across the Reston Parkway bridge. Summary Option 1, involving east-side access under the Reston Parkway bridge, is the preferred option because it can provide the most convenient and direct access to the station platform, and therefore will encourage greater transit ridership. However, it is probably also the most costly because it requires lowering of the track profile to provide space above the trains for the pedestrian underpass. This will require building of long retaining walls and reconstruction of the center pier supporting the Reston Parkway bridge. Option 2, involving east-side access on a pedestrian overpass across the Reston Parkway bridge, is less desirable because it requires greater vertical movement for pedestrian access. Option 3, involving east-side access across the Reston Parkway bridge at a signalized crosswalk, is also less desirable because of the less safe and attractive pedestrian crossing, the delay it causes for pedestrian access to the station, and the modest amount of interference that a well-coordinated signal for the crosswalk would have with motor vehicle traffic. All three options should be further evaluated for each of the three Reston area stations in terms of preliminary design, costs, and pedestrian convenience and safety. The option of staging the development of the stations, so that four-corners access might be provided later through new second mezzanines, should also be evaluated for each of the three stations. (0478, 0484- E-27)

Public Comment: For almost ten years now, community leaders have been steadily and consistently advocating that direct, safe, and convenient pedestrian and bicycle access be provided to the Reston stations from all four quadrants of the Dulles Toll Road interchanges. Unfortunately, despite numerous specific proposals for how this might be achieved, no acceptable way of accomplishing this goal has been developed by the Project. As we approached the DEIS hearings, we have focused more detailed attention on the technical challenges involved, and with hearings, we have focused more detailed attention on the technical challenges involved, and with the assistance of Mr. Ik Hong, Metro's manager of extension projects, we have now developed the attached preliminary conceptual engineering recommendations for accomplishing this. (0478, 0484-E –14)

Public Comment: During the FEIS and rail PE process we need hard work on…Improved grade-separated pedestrian access to stations from all 4 quadrants of all 3 Reston area stations. (0173, 0213-M –3)

Public Comment: And, incidentally, I would certainly support the comments of others, including Joe Stowers, who indicated the need or at least a preference for providing access from all four quadrants. (0194, 0194-T –4)

Public Comment: Four quadrant station access is the optimal situation. However, since this might not be achievable initially without delaying the basic project start, station access from both sides of the corridor must be at a minimum. I would recommend that the pedestrian bridges should be wider and permit them to be used as a way of accessing not only the stations, but also serving as a dedicated way for

pedestrians to get from one side of the corridor to the other. A long time community objective. The entrances to the stations could be closed [dare I say gated?] when Metrorail is not operating, but the bridges should remain open to permit pedestrian to cross the corridor 24/7. (0208, 0208-M –2)

Public Comment: References the Washington Airports Task Force's proposal for air rights development over the Reston Parkway Station to conclude that pedestrian crossings above existing bridge levels may be preferred over lower level crossings (i.e., pedestrian underpasses). (0494 2-03)

Public Comment: Would like the following questions answered pertaining to the "four corners access."

- What is the best way of accomplishing the objective of achieving four corners access, either as part of the initial project or in a phased development plan?
- How far eastward can the station platforms be moved in order to reduce walking distances from the east side of Reston Parkway and Wiehle Avenue without modification of Metro standards and without moving the currently planned points of access?
- What is the best way of providing a pedestrian linkage below the Reston Parkway and Wiehle Avenue bridges?
- What are the approximate costs of each option if done in the most cost-effective manner?
- What specific changes in the currently proposed station designs should be made in order to make these options feasible in a phased development program? (0494 2-04)

Response: *As detailed in Chapter 2 of the Draft EIS, numerous alternatives, including alternate configurations for the Reston Parkway Station, had been studied prior to conducting the detailed evaluation of BRT and Metrorail that was presented in the Draft EIS. An alternative that would have involved shifting the Reston Parkway Station nearer to the Reston Parkway overpass and providing access to the four quadrants of the interchange was eliminated from more detailed consideration in the Draft EIS because these changes would have increased the costs and impacts of the project, without providing additional benefits over the locations evaluated in the EIS. These reasons were explained fully in the Final Alternatives Analysis Report (May 2001). Some findings are summarized below.*

The previous analysis indicated that lowering the profile of the Metrorail alignment beneath the Reston Parkway overpass would have undermined the pier footing supporting the bridge, requiring the complete reconstruction of the overpass. This change would have resulted in considerable construction impacts on the transportation system, including temporary but long-term lane closures, traffic detours, travel delays, and diversion of traffic onto alternate routes that were already over-burdened. Congested travel conditions in the Reston community would have been substantially worsened during reconstruction of the overpass. In the long-term, because the density bonuses allowed in the Fairfax County Comprehensive Plan would be centered on the station platform location, providing direct access to all four quadrants of the Reston Parkway interchange would not have increased the ridership potential at the Reston Parkway Station. Shifting the station closer to the overpasses would have ultimately reduced future ridership potential somewhat because the size of the interchange footprint at this location would have reduced the amount of developable land within walking distance of the stations.

As noted in the Final Alternatives Analysis Report (May 2001), *pedestrian access to the four quadrants could be provided by landscaped walkways and crosswalks, possibly with an all-walk phase on the signal timing to allow pedestrians to safely cross. However, improvements to the local streetscape and walkway network that are not directly linked to the Metrorail station itself would be under the jurisdiction of Fairfax County and the Virginia Department of Transportation. The design of the Reston Parkway Station will be part of continuing coordination with Fairfax County. As currently designed, the Reston Parkway Station does not preclude construction of access to adjacent overpasses as suggested in this comment; however, at this time no specific provisions are planned to accommodate it.*

The alternatives proposed by the commenter have several technical constraints. First, moving the Reston Parkway Station 300 feet east would have required extensive reconstruction of the

DIAAH and possibly the Dulles Toll Road near the bridge piers at Reston Parkway. The proposed shift would have also precluded the future construction of the third lane of the DIAAH in each direction.

Second, the horizontal configuration proposed by the commenter would not have worked geometrically. To use the absolute minimum curve radius allowed by WMATA (755 feet), the length of the spirals would have to have been reduced (as indicated in the commenter's Exhibit 1). However, the existing spiral lengths are already at the minimum allowable length (100 feet). A reduction in spiral lengths would violate WMATA Design Criteria and would not permit safe vehicle operations.

Third, the proposed profile for the commenter's Option 2 (a pedestrian connection under the Reston Parkway Bridge) would have introduced an 1,800-foot length of retained cut and would have impacted the support structure for the Reston Parkway Bridge. Severely lowering the rail profile would have required extensive underpinning of the Reston Parkway bridge piers, and would not have allowed room for the planned third lane on the DIAAH without a major reconstruction of this bridge. As noted above, such reconstruction would have had substantial impacts on the community.

The pedestrian bridge and station are designed so that pedestrians may cross from one side of the corridor to the other without entering the station proper and without paying a fare. However, it is anticipated that during the few hours that the station is not open, the entrances to the pedestrian bridge and vertical circulation devices would be secured due to security and vandalism concerns. Should the local government desire the bridge to remain open 24/7, WMATA, as the operator, may request that the local government be responsible for maintenance and operation of the entrance and pedestrian bridge facilities.

Access Across Reston Parkway

Public Comment: One issue that we will be watching with particular concern is access planning for the rail station. Our company, along with several others with thousands of employees, is located east of Reston Parkway. In order to access the station, employees will have to cross Reston Parkway, a wide roadway with high-speed traffic. Once rail has been determined as the locally preferred alternative, more detailed station area planning studies, including access planning, need to be undertaken to develop good access from areas east of the Reston Parkway Bridge. (0233, 0426-M –34)

Response: *DRPT is the Project's sponsor and initial owner. However, the responsibility for modifications of sidewalks and trails as part of station access is with Fairfax County, Loudoun County, Town of Herndon, City of Falls Church and VDOT. DRPT will, though, coordinate with these jurisdictions and agencies during preliminary engineering and final design to determine the improvements for station access beyond the station site plans, as well as their ownership and maintenance. Close communication would also occur with the Fairfax County Non-Motorized Transportation Committee, private landowners and developers and other stakeholders. The Fairfax Countywide Trails Plan and the Loudoun County Trails plan have been and will be consulted. Comprehensive pedestrian circulation beyond the station site plans may be implemented in conjunction with other planned developments, County, and/or State projects and/or as elements of the Fairfax Countywide Trails Plan and the Loudoun County Trails plan.*

Access from the east side of Reston Parkway – referred to as the "four-quadrant" access concept - was considered in technical memoranda prepared during Initial and Intermediate screening. The findings were that relocating the Wiehle Avenue and Reston Parkway stations to support four-quadrant access would have greater construction-period impacts, reduce shoulder widths on the Dulles Toll Road and DIAAH, require major reconstruction of the existing overpasses, and result in significantly higher construction costs. Based on this analysis, the concept was not carried forward.

Economic Benefits of Metrorail

Public Comment: Wherever metrorail goes, prosperity follows. Metrorail is a tangible and measurable asset for both businesses and local economies. (025, 0253-T –3)

Public Comment: Metrorail serves as an icon in local employment. It stands as one of the largest and most stable employers for many area residents. Metrorail employees and their families use the system and shop and spend their money with our local businesses. (025, 0253-T –4)

> ***Response***: *The Project Team agrees that rail transit has been shown to have positive effects on property values in the vicinity of transit stations. As described in Chapter 5, accessibility, particularly that provided by rapid, high capacity transit, is a critical aspect of local economic development and has been shown to have positive effects on property values in the vicinity of stations.*

Reliability of Metrorail

Public Comment: Metrorail knows transit. It has a 98 percent reliability track record, making it the number one rapid transit system in the country. Metrorail is known for its clean, safe and well-governed system. Metrorail has set the benchmark for efficiency and operations that other cities such as Atlanta and Los Angeles try to emulate. (025, 0253-T –2)

> ***Response:*** *Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative. The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative.*

Traction Power Station Conflicts

Public Comment: Rural Estate is strictly residential use requiring 2 to 5 acres per dwelling unit. The fact of the matter is the Golf Park is an aberrant use that required a special governmental action. That special action in no way enlarged the underlying Master Plan use for this property. It remains as planned, RE. The proposed action of locating a Traction Power substation along with holding ponds on this residential property is in direct conflict with the Master Plan. The traction station will be a visual intrusion and could have both short-term and long-term impacts. This visual intrusion impacts the rural residential aesthetic character of this land. Proposing an industrial use on rural estate residential land is totally inappropriate and could ultimately create serious local citizen opposition to any rail option. (0148, 0463-L –2)

Public Comment: The transit rail facilities from the Golf Driving Range should be relocated to a more appropriate site like the commercial and VDOT properties located to the west of Hunter Mill Road. (0148, 0463-L –5)

Public Comment: It is unclear why the traction power substations proposed in the Draft EIS must be located on private property or the places proposed in the Draft EIS, especially in the Mid-Corridor. The adverse impact of these structures does not appear to be addressed.(0510, 2-03)

> ***Response:*** *The locations of Traction Power Substations (TPSS) and Tie Breaker Stations (TBS) are preliminary. As stated in Chapter 2 of the Final EIS, these ancillary facilities were sited based on systems engineering requirements, environmental, and right-of-way constraints. In addition, a power analysis was conducted to determine the number and size of substations required and the optimal spacing for these stations. The location of these ancillary facilities will be evaluated during preliminary engineering. For proposed locations, efforts will be made to minimize impacts to the adjacent areas in terms of their access, architectural treatment, and landscape screening. Substation enclosure designs will be further developed during preliminary engineering and final design. Individual sites will be taken into account, and enclosure design will be context-sensitive.*

Location of Major Service & Inspection Yard

Public Comment: The issues here in Loudoun County at your two transit stations, I think we agree that the site at 606 that's in the transit-related employment center, should not be a service and inspection yard, that that yard should most properly be on the airport. (0141, 0243-T –2)

Public Comment: The rail Yard [7] would lie in 13.6 acres of floodplain and 17.41 acres of RSCOD, river and stream overlay district. The maintenance building would be in the floodplain. A small amount of wetland would also be destroyed. Floodplain would be altered. Its elevation would rise 0.6 feet. (0248, 0248-T –7)

Public Comment: The County Transportation Plan provides for the Greenway loop road. Rezonings have been approved in reliance upon that road. The construction of the bridge across the Dulles Greenway is committed to by the Greenway developer. Greenway loop road right of way, however, is drastically consumed by rail yard 7, thereby destroying that road. (0248, 0248-T –8)

Public Comment: I think what I am beginning to see is that this little stretch of land, the easement that runs between Mercure Park and our property, is very desired, not only by the metrorail statement location Y-20, but also Virginia Dominion Power wants to run power lines down there. That particular area of our community is adjacent to the edge in Broad Run River, and we have plans on the -- a general site plan to build a walking path that wraps around the community and comes up to our rec center. It is our belief that this path will become much less aesthetically pleasing with power lines and rail yard and tracks leading to that rail yard running right there. Essentially this would put these rail tracks within a hundred yards of approximately 60 homes, not to mention being within 1000 yards of the majority of this entire community. (0260, 0260-T –3)

Public Comment: We are already facing additional runways at Dulles and the Virginia Dominion Power issue with the overhead power lines, and we would like to request that the Y-20 location just be struck completely from consideration. (0260, 0260-T –4)

Public Comment: The specific issue that I am here to speak on behalf of is to oppose the rail yard service and inspection area of Y-20. We favor Y-7 or Y-15, preferably Y-15. (0260, 0260-T –2)

Public Comment: Rail Yard 7 consumes land planned for a transit node which will pay real estate taxes. A rail yard is tax exempt. (0248, 0248-T –10)

Public Comment: The transit node planned for that site [Yard 7] would generate substantial ridership. A rail yard would provide almost none. (0248, 0248-T –9)

Public Comment: Site #20 Maintenance Yard: The option for maintenance land south of Broad Run Floodplain on the Westwind/606 property would limit the opportunity to establish the connector road crossing envisioned in the County CTP for Westwind Drive. Therefore, for the purposes of access to the areas west of the Dulles Greenway, as commented at the public hearings by the County Board of Supervisors representative, CMCF recommends that site #15 on the Dulles Airport property be chosen for maintenance facilities. (0451, 0451-L –7)

Public Comment: Three locations are indicated for the Metrorail Service and Inspection Rail Yard sites including one on Washington Dulles International Airport property. We certainly think that Site 7, which is developable land adjacent to one of two transit stations in Loudoun County, should be reserved for transit-oriented development. The site is designated a transit-related employment center in the Loudoun County Comprehensive Plan. The proposed mixed-use development would provide employment, increased property values, sales and income taxes -- significant benefits to the state and County and increased transit ridership and fare revenues - a significant benefit to the rail system. Site 7 is a premier location, a gateway to Loudoun County, and as such an inappropriate site for a rail yard facility. (0141, 0443-E –9)

Public Comment: Rail Storage and Maintenance Yard: Enclosed is a copy of a Memorandum from Wetland Studies and Solutions, Inc. dated July 25, 2002. This document reports the impact on certain environmental resources at the 3 sites identified in the DEIS for consideration for the location of the rail storage and maintenance yard. The document clearly shows that Yard 7 has by far the greatest adverse environmental impact. It is a massive intrusion into the RSCOD and is not a permitted use in such an area in Loudoun County. We ask that it be withdrawn from consideration. (0248, 0447-L –6)

Public Comment: States that the Project Team's facts do not support the claim that, in comparison to Site 7, there would be a greater potential for effects on the natural environment at Sites 15 and 20. Notes that while a Metrorail crossing would be allowed in the River and Stream Corridor Overlay District (RSCOD), a rail yard is not. Statement on page 489 of the *Public Hearings Report* that the Greenway Loop Road does not yet appear in the regional transportation plans is incorrect. The road is shown in the Countywide Transportation Plan on page 594 and inexplicably shows Yard 7 as "Good", Yard 15 as "Poor", and Yard 20 as "Fair" with respect to effects on wetlands. A study done by Wetlands Solutions, Inc. shows wetland areas for the sites: Yard 7, 0.25 acres; Yard 15, 0.62 acres; and Yard 20, 1.3 acres. (0248, 2-01)

Public Comment: I would like to reemphasize that the Loudoun County Board of Supervisors unanimously, nine to zero, encourages you to select the Metro Alternative and that you select Site 15 for the rail yard on the Dulles property. (0258, 0258-T –2)
Public Comment: Strongly supports the selection of Metrorail Alignment T6 and Yard Site 15 as the Locally Preferred Alternative.(0141, 2-04)

Public Comment: I would also like to note two additional reasons to support our case. One is obviously the property value decreases that we would be facing by having this kind of rail running within 100 yards of 60 homes, the majority of which those homes are not sold yet, and people moving in there probably are not even aware of this, and I am very pleased to see the Board of supervisors here looking out for the interests of future owners as well as myself. (0260, 0260-T –5)

Public Comment: The second main issue is my wife and two children are here tonight. I have a seven and five-year-old who are greatly curious little boys, and I'm sure that they would be curious about climbing over and trying to play on what I consider to be pretty dangerous rails that probably would not be fenced in the same as the main lines, as this is just a little access trail back to the rail yard [Y-20]. (0260, 0260-T –6)

Public Comment: The second main issue is my wife and two children are here tonight. I have a seven and five-year-old who are greatly curious little boys, and I'm sure that they would be curious about climbing over and trying to play on what I consider to be pretty dangerous rails that probably would not be fenced in the same as the main lines, as this is just a little access trail back to the rail yard [Y-20]. (0260, 0260-T –6)

> ***Response***: *Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner and with Yard Site Y15 on Airport property as the Locally Preferred Alternative. The LPA will be constructed in two phases, the first being the Wiehle Avenue Extension.*
>
> *With respect to wetland impacts, Site 7 was shown as 'good' in the Public Hearings Report (October 2002) because the Project Team could have designed that yard so that wetland impacts would be minimized or avoided. For the selected Site 15, however, wetland impacts will not avoided.*

West Falls Church Yard Improvements

Public Comment: I am concerned about many things with this Metro yard [West Falls Church]. I think we have more than our share of noise & "runoff" from the station & yard here. I sincerely hope it won't get worse. (0230, 0230-L –1)

Public Comment: In addition, BRT cannot serve Tysons Corner in any efficient way. A hybrid plan to extend rail to Tysons Corner and run BRT to Dulles is further flawed, since it incorporates no new Metro vehicle service facility. The facility at West Falls Church is already near capacity and it seems unlikely there would be room to store or service additional cars to run a Tysons loop and at the same time expand service on the Orange Line. (0186, 0186-T –4)

Public Comment: MetroRail to Tysons Corner only with Bus Rapid Transit beyond to Loudoun County is not a viable option as it has all of the problems of Bus Rapid Transit noted above. The greatest MetroRail investment is for subway and elevated construction in Tysons Corner which is part and parcel of this alternative. There would be no shop or yard for such a truncated extension. West Falls Church Storage and Inspection Yard is full. Its expansion would pose severe economic, environmental and geometric problems to no advantage. (0013, 0013-L –21)

Public Comment: I am writing to express my concern that the current Metro maintenance yard might be expanded to accommodate some sixty additional metro cars. This is the West Falls Church yard. Please know that we on McKay Street do not have a NIMBY-esque (Not in My Back Yard) attitude. We live with the noise and activity of the current maintenance yard - mostly with no problems. But to double the amount of cars which brings amplified noise (squealing, ding-dongs, and employees talking to one another over mic systems) and possibly water run-off from washing cars is a bit much for us. Why not just build the Dulles Maintenance Yard now? (0385, 0385-L –1)

> ***Response:*** *The Wiehle Avenue Extension improvements at the West Falls Church S&I Yard include the addition of storage tracks and modifications to the existing Service and Inspection Building. As part of the mitigation for these improvements, a covered box on the yard's existing loop track and the new yard lead track would be built to help minimize sound from rail cars proceeding through the yard. These track and service building improvements are necessary for operation of the Wiehle Avenue Extension, but would be occurring at some time in the future to support WMATA operations regardless of this Project's implementation. The area within West Falls Church Yard loop that was always planned for future storage will be built-out to accommodate the storage of up to 42 additional Metrorail cars. The total number of stored cars will increase from 148 to 190.*
>
> *Efforts are underway to minimize the use of amplified communications within the yard. Run-off from the car wash is recycled and solvents used to clean the cars are captured via a containment system.*
>
> *It would be impossible to open a yard at the Yard Site 15 on Airport property until the remainder of the Full LPA is constructed and operating.*

Support for Alternatives - General

Public Comment: Support rail to Reston or Tysons. Support BRT to Loudoun County. (0092, 0092-CC-1)

Public Comment: I see what has been called as the Dulles transit corridor rail as really what should be two distinct projects. The first, which I call Tysons rail, lies between West Falls Church and Tysons West. The second, which I call Western rail, lies from Tysons West out to Dulles airport or Loudoun County. This evening I will be advocating for Tysons rail and against Western rail. (0134, 0134-T –1)

Public Comment: In general, I am a strong advocate of Metrorail where it is appropriate to support walkability, but criticize wasting money on it in areas where it is inappropriate. Generally speaking, rail is appropriate in walkable urban-style development and inappropriate in car-oriented sprawl developments. Metrorail can be appropriate in Tysons provided Tysons is converted to be truly walkable. That would involve infilling new retail office and residential to directly front wide sidewalks with shady street trees and providing safe street crossings for pedestrians by, for example, dividing Tysons' wide arterials into multiple roadways In the manner of K street downtown. Metrorail is inappropriate where its only purpose is to create large parking garages. When a Metrorail station is called the Reston parkway and lies in the median of the Dulles access road, what kind of a place is that? It's the crossroads of asphalt and raceway wasteland. A rider getting off the Metrorail is nowhere near anything. (0134, 0134-T –2)

Public Comment: One approach that I think does merit careful consideration-- and I haven't reviewed the documents closely enough to have an opinion, is the phased approach where the Metrorail goes to Tysons, and then you do BRT from Tysons westward. As usual, in many complex problems, some hybrid solution is preferred, and I think the debate becomes polarized between the bus system and the rail system. And while, from what I've seen, I tend to favor the bus system, I do believe that the hybrid approach merits careful consideration as well. (0286, 0286-T –4)

Public Comment: Boston Properties is the owner and developer of the 162-acre Broad Run Technology Park located between the AOL Time Warner and MCI WorldCom campuses. We have completed one of the nine master planned buildings and the Park has an office development capacity of over one million square feet. In addition, Boston Properties has completed over three million square feet of development in the Northern Virginia Technology Corridor and has over 15 million square feet either completed or planned in the Washington Metropolitan area. Given this magnitude of office development in the Northern Virginia area, we are highly supportive of the efforts to bring rapid transit to the Dulles corridor. (0003, 0003-L –1)

Public Comment: The National Capital Area League of Women Voters was founded to provide a forum for study and action on transportation policy in the Washington Metropolitan Area. We were among the earliest and most enthusiastic supporters for building a mass transit system. We have many positions that favor expansion of this system, addressing issues of access, safety, social equity, environmental quality, sound land use planning, regional governance, and public participation in decision-making. (0206, 0206-M –1)

> ***Response****: Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The LPA will be constructed in two phases, the first being from the Orange Line to Wiehle Avenue Station.*

Public Comment: In 'Don't Miss the Bus,' it is reported that RapidBus offers a quality of service comparable to rail transit without the need for tracks. It is designed to provide very frequent service using special buses, operating exclusive rights-of-way to the extent possible, and to provide up-to-the-minute transit service information at attractive stations. (June 2002, Metro Regional Bus Study Update) The data analysis completed resulting in the above conclusions should be included in the DEIS for public review. The findings from this study do not reflect the biases for rail as shown in the DEIS. (0147, 0459-L –5)

> ***Response:*** *The assumptions regarding BRT that were used in the Draft EIS were outlined in detail in the Chapter 2, Alternatives Considered, of the Draft EIS as well as in the Transit Operations and Maintenance Plan (June 2002) and the Travel Demand Forecasting Methodology and Results Technical Report (June 2002). Data from these documents show that the BRT system would have operated quite frequently on multiple route patterns and would have utilized rail-like stations and unique and attractive vehicles. Furthermore, one of the key inputs into the*

ridership forecasting model was a modal constant that reflected riders perceptions of different transit modes. The BRT modal constant in the Dulles model was higher than regular and express bus, meaning that BRT would have been perceived as more attractive by regular and express bus riders, which was reflected in the demand forecasting process.

Opposition to BRT/Metrorail Alternative

Public Comment: MetroRail to Tysons Corner only with Bus Rapid Transit beyond to Loudoun County is not a viable option as it has all of the problems of Bus Rapid Transit noted above. The greatest MetroRail investment is for subway and elevated construction in Tysons Corner which is part and parcel of this alternative. There would be no shop or yard for such a truncated extension. West Falls Church Storage and Inspection Yard is full. Its expansion would pose severe economic, environmental and geometric problems to no advantage. (0013, 0013-L –21)

Public Comment: The purpose of this project is to reduce highway congestion, air pollution and accidents. This alternative [BRT/Metrorail Alternative] will not do well. (0013, 0013-L –22)

Public Comment: A combined BRT/Metrorail system would discriminate against the western end of the corridor and force passengers to transfer from bus to rail at Tyson's Corner. (0175, 0202-L-2)
